COCCIDIOIDOMYCOSIS

O. J. FARNESS, M.D.
TUCSON, ARIZ.

Coccidioidal infection is no longer of uncommon occurrence. Up to the present time most of the cases occurring in this country have been reported from California. Undoubtedly the disease is more prevalent in that state, but evidence is accumulating which would indicate that foci of infection exist in other sections of the country as well; and when one considers the extent of cross country travel now going on it becomes apparent how easily the disease can be disseminated. It behooves physicians in every case of pulmonic infection not readily diagnosed to consider Coccidioides. This infection was first recognized in 1892 by Wernike¹ of Buenos Aires. Since Rixford² reported the first American case from California in 1894, 578 cases³ with 278 deaths were recorded to June 26, 1939 in that state, the majority of cases coming from the San Joaquin Valley and Los Angeles County. Only an occasional case has been reported from other sections of the country.

The disease is produced by a specific pathogenic fungus, *Coccidioides immitis*. The organism occurs in two forms or cycles: one, the parasitic form, found in infected tissue; the other, the vegetative form, found in culture and presumably in nature. In infected tissue and sputum the organism appears as a spherule, varying from 5 to 60 microns in diameter and having a highly refractile, double-contoured capsule. The spherule form is presumably not transmissible, as man to man or animal to man infection is unknown. On suitable culture mediums, hyphae are formed which bear chlamydozoospores that are easily transported through the air. It is the chlamydozoospores which, probably mixed with dust, gain access to the body tissues and produce the disease.

The *Coccidioides* fungus is known to infect cattle,⁴ sheep and dogs⁵ as well as human beings. No age is immune to the infection. The portal of entry, except in the occasional primary cutaneous lesion due to trauma, is the respiratory passages. The dissemination of the infection occurs through the blood and lymph streams and by direct extension from the primary focus. The disease may involve any organ in the body,

but the lungs, skin, bones, lymph nodes and meninges are most commonly affected.⁶ The incubation period is still in doubt, although cases in which the probable time of infection is known would indicate that it is between one and three weeks. Conditions suitable for maintaining the infectivity of the organism are found in places in which there is some rain and little cold, permitting easy distribution of the chlamydozoospores with the dry soil of the region. When one realizes that many areas of the dry Southwest meet these requirements, it becomes apparent that the possibilities for the maintenance and spread of the disease are considerable.

In 1938 Dickson⁷ published epidemiologic studies of coccidioidal infection which added much to the knowledge of this disease. He and his associates found that *C. immitis* infections, parading under the labels "valley fever" and "desert fever," are of common occurrence in the San Joaquin Valley of California. This generally acute infection involving the respiratory tract was considered by them as an early manifestation of the disease. It is characterized at the onset by signs and symptoms of a cold or influenza, and not infrequently of bronchopneumonia, and is followed in seven to fifteen days by an outbreak of erythema nodosum. Recovery in from three to six weeks is the rule. Some idea of the incidence of this "valley fever" type of infection is obtained from the fact that 354 cases⁷ were reported between January 1936 and May 1937. Among the 354 cases there was only 1 death. However, in other endemic areas this self-limited, acute infection with accompanying erythema nodosum does not occur with such high incidence or regularity. An explanation for this was given by Jacobson,⁸ who expressed the belief that the resident population of the San Joaquin Valley acquires an active immunity as a result of frequent exposure to small doses of chlamydozoospores, which presumably heavily infect the soil of that region. These are phases of the disease which only time and study will solve. From the literature and from personal observation I feel that, as in tuberculosis, the initial infection constitutes a primary-like complex which usually heals, and that secondary chronic progressive disease follows in a certain percentage of cases.

Coccidioidal disease is protean in its clinical manifestations, and its mimicry of tuberculosis and blastomycosis is such that a diagnosis can be made with certainty only by finding the characteristic spherules in the tissues, pus or sputum and confirming this discovery by culture and guinea pig inoculation.

A good routine diagnostic method is to concentrate sputum, gastric contents, or other likely material, from a suspected patient and examine the sediment in a wet

preparation without staining for the typical *coccidioides* spherules. Part of the sediment is then cultured on Sabouraud's medium and part injected intraperitoneally and intratesticularly into guinea pigs. On culture, a white fluffy growth is obtained which is composed of mycelium and chlamydospores. In the inoculated guinea pigs, abscess formation and recovery of the diagnostic spherule is accomplished in ten to thirty days.

Clinical features of pulmonary infection are often those of a "cold" suggesting influenza and not infrequently pneumonia or tuberculosis. Cough and sputum, which may be blood stained, pleural pain, chills, fever, nocturnal sweats, loss of weight and strength, malaise, weakness and general debility are present in varying degrees. Tender, painful joints may be observed in early, acute infection. Blood eosinophilia and erythema nodosum, while not constant features of the cases I have seen, were observed and should be considered manifestations of coccidioid infection. An erythematous cutaneous rash, generalized or limited to the trunk, has been described by Faber and his associates⁹ and has been observed in several of my younger patients. The rash appears a few days after the onset of the acute

rate of 50 per cent. The percentages of patients with early acute infection who will die and of those who will go on to the chronic stage of the disease has not yet been determined.

A specific cutaneous reaction is obtained in infected patients. Coccidioidin, as prepared by Dr. Charles E. Smith of Stanford University School of Medicine, has been widely used. The technic is simple and similar to that used in tuberculin testing. One tenth cc. of a 1:1,000 solution is injected intradermally and the reaction determined in forty-eight hours. A positive reaction, like the tuberculin reaction, is accompanied with erythema and induration and sometimes vesiculation. If the 1:1,000 dilution test gives negative results, a 1:10 dilution is used. Syringes previously used for tuberculin testing must not be used for coccidioidin testing because false positive reactions are apt to occur. From observations and available data, it would appear that the reaction is specific, develops early in the course of the disease and persists indefinitely. In this community, several groups have been given cutaneous tests with interesting results. Out of 43 patients in the Southern Pacific Tuberculosis Sanatorium,¹² most

Fig. 1 (case 1).—Massive consolidation extending from the left hilus to the chest wall. The root of the right lung is dense, and there are bronchopneumonic foci scattered throughout the right lung. A portable x-ray apparatus was used.

infection and usually disappears in seven to ten days. Roentgenograms of the chest show hilar thickening and dense shadows scattered through the pulmonary fields. Frequently tuberculosis is diagnosed on first examination. Cavitation¹⁰ occurs which, with the surrounding infiltration, is indistinguishable from tuberculosis until analysis of the sputum reveals the true nature of the infection. Gastric washings are frequently necessary to obtain material for study. Smith¹¹ has observed a patient in whom coccidioid pleurisy with effusion developed and another patient who had coccidioid peritonitis. Both recovered.

Recovery from the acute phase of this infection occurs commonly in a few weeks to a few months time. Occasionally a patient may die during the acute infection; in other patients there is dissemination of the organism to other parts of the body, which eventuates in a chronic, progressive disease, with a case fatality

of whom were not residents of Arizona, 10 per cent reacted positively. Among 60 patients at the Pima County General Hospital who were citizens of Arizona, there were between 20 and 30 per cent positive reactors. Of 141 Pima Indian school children given cutaneous tests by Dr. J. D. Aronson, of the Henry Phipps Institute of Philadelphia, 90 per cent gave positive reactions. I think these results definitely establish the presence of a focus in the Tucson area. In the accompanying table¹³ are listed the results of coccidioidin cutaneous tests from various sections of the country.

Treatment of this disease in general has been extremely varied, and no definite specific results have been noted from any drug therapy. Antimony and potassium tartrate given intravenously and colloidal copper given intramuscularly have been used without consistently satisfactory results. Specific vaccine therapy is being used, but no definite conclusions can be made as to the sustained effect. Sulfanilamide and

sulfapyridine are now being tried on slow healing and destructive lesions. However, not enough patients have been submitted to this form of treatment to enable one to state that it should be used in preference to other forms of therapy. Because primary coccidioidal infection appears generally to be benign and self limited, it would seem that rest in bed until all signs of the infection are gone would be most important and usually sufficient. For the case that tends to progress to the chronic granulomatous stage, drugs and vaccine therapy should certainly be tried.

REPORT OF CASES

CASE 1.—H. S., a white man aged 67, living within the city limits of Tucson, was admitted to the hospital April 12, 1932 with signs and symptoms of bronchopneumonia. Ten days before this he had contracted a severe cold. On the third day after admission the patient died. Autopsy revealed multiple bronchopneumonic foci throughout both lungs, many with necrotic centers, and an abscess measuring 2.5 cm. in diameter was present in the midportion of the left lung. *C. immitis* was recovered from the abscess and some of the bronchopneumonic foci. No foci of infection with *C. immitis* could be found in any other part of the body. A roentgenogram of the chest

disease process in both lungs. Several large cavities could be seen in the right apex.

CASE 3.—P. T.,¹⁰ a white youth aged 15, was attending school in Tucson because of the difficulty of controlling head infections at home in Michigan. About Dec. 15, 1936 he caught a severe cold. He went home for the Christmas holidays and returned early in January feeling well except for a slight productive cough. There had been no significant rise in temperature. There was no loss of weight noted. On Jan. 16, 1937 (fig. 3), a roentgenogram was made of the chest which showed a 3 by 4 cm. cavity in the right infraclavicular region. The white blood cell count was 10,500 with 27 per cent eosinophils. Repeated analyses of the sputum failed to reveal any acid-fast bacilli but did reveal typical coccidioides spherules. The tuberculin test gave negative results. The coccidioidin test gave strongly positive results. Before the diagnosis had been definitely established it was felt that the condition was acute tuberculosis, and the right lung was immediately collapsed by artificial pneumothorax. This procedure was abandoned on obtaining definite proof by culture and guinea pig inoculation that this was an instance of coccidioidal infection of the lungs. In retrospect it would seem that the procedure was good treatment and should have been continued. Nevertheless, the large cavity healed rapidly and a roentgenogram of the chest taken Aug. 8, 1937 showed it to be closed. The patient

Fig. 4 (case 4). Dense, soft infiltrations scattered throughout both lungs, especially on the right. The hilar shadows are increased. A portable x-ray apparatus was used.

Fig. 5 (case 4).—Appearance one year later. Only a few scars remain at the site of the original lesions.

Fig. 6 (case 5).—A fine, diffuse infiltrative process about the small bronchi of both lungs together with minute parenchymal foci. The picture is that of a miliary process. A portable x-ray apparatus was used.

taken April 11 (fig. 1) showed a heavy, diffuse density extending from the left hilus to the lateral wall of the chest. The root of the right lung was dense, and there were scattered bronchopneumonic foci throughout the entire right lung. There was no history of erythema nodosum, nor was any increase in the eosinophils of the blood noted.

CASE 2.—C. C., a white man aged 46, a carpenter, had been a resident of Tucson since 1928. Since Oct. 1, 1936, when a roentgenogram of the chest showed a fibrotic process in the upper field of the right lung with honeycombing, the patient had been treated for pulmonary tuberculosis. No tubercle bacilli had ever been found in his sputum. After a "terrible cold" in November 1937 the patient had coughed and raised large amounts of purulent sputum, sometimes blood streaked. I first saw the patient in August 1938, at which time the sputum contained numerous coccidioides spherules. This discovery was confirmed by culture and guinea pig inoculation. A roentgenogram of the chest July 8, 1938 (fig. 2) showed a heavy, dense, fibrotic process with honeycombing, involving both lungs, especially the upper part of the right lung. The coccidioidin cutaneous test gave positive results. Eosinophilia was not noted. A history of erythema nodosum was not obtained. The patient had had diabetes mellitus since 1933. On Feb. 15, 1939 he died in diabetic coma. Autopsy revealed chronic coccidioidal granuloma of both lungs with scattered cavities and a coccidioidal abscess in the liver. A roentgenogram of the chest taken February 10, a few days before death, showed an increase in the

has continued in excellent health although the cavity has shown a tendency to reopen. Erythema nodosum did not occur. Interesting features were the absence of constitutional symptoms, the high eosinophilia and the early formation of a cavity with healing.

CASE 4.—T. G., a white youth aged 15, living on a ranch near Tucson, admitted to the Desert Sanatorium Feb. 9, 1938, complained of backache, headache and pain in the chest. His temperature was over 102 F. He coughed a little but could produce no sputum. A roentgenogram of the chest (fig. 4) showed heavy, fuzzy infiltrations through the midzone of both lungs. A generalized erythematous cutaneous rash appeared on the third day of illness and persisted for about a week. On February 24, nineteen days after the onset of the acute illness, the painful red nodules of erythema nodosum appeared on the arms and legs. Both tuberculin and coccidioidin cutaneous tests gave positive results. *C. immitis* was recovered from the gastric contents. The patient was kept in bed for a period of six months, after which he was permitted to resume his normal life. The pulmonic lesions gradually cleared, and a roentgenogram taken Jan. 16, 1939 (fig. 5) showed only a small residuum of scar at the site of the original lesions. The patient is entirely well at the present time.

CASE 5.—B. M.,¹⁴ a white woman aged 23, had been a resident of Tucson for three years. On Jan. 10, 1939 she was

14. Courtesy of Dr. R. K. Smith, Tucson.

delivered of a full term baby. She had not complained of any illness prior to this time. After delivery she had high fever, increasingly severe dyspnea and extreme weakness and died January 29. Her temperature was of the "picket fence" type and ranged between 98 and 105 F. daily. On January 18, eight days after delivery, a roentgenogram of the chest showed a fine, diffuse, infiltrative process about the small bronchi of both lungs together with minute parenchymal foci. Examinations of the sputum were negative for tubercle bacilli. On January 22 another roentgenogram showed an increase in the fine stippling throughout both lungs, especially in the lower lobes. The white blood cell count never exceeded 14,000, but the polymorphonuclear cells were consistently around 90 per cent. A roentgenogram (fig. 6) taken January 28 showed miliary seeding throughout both lungs. No erythema nodosum developed. The

* Four patients were in terminal stage.

patient died on January 29, nineteen days after the onset of the illness. Autopsy revealed multiple minute, grayish, abscess-like foci throughout both lungs in which abundant coccidioides spherules could be demonstrated. Coccidioides tubercles were also present in the spleen and liver. The case stands out because of its striking similarity to acute hematogenous miliary tuberculosis and because of the rapidly fatal course.

COMMENT

These 5 reports of coccidioidomycosis were selected from a series of 10 patients I have seen who incurred their disease in this community. With the exception of patient 1, all have been observed within the past three years, the period during which I have been actively interested in this disease. There can be no doubt that the incidence of infection with *C. immitis* is fairly high in this area; and why may not the same hold true for many areas that have the same climatic conditions? Also, when it is realized that 127 out of

141 Pima Indian school children and up to 30 per cent of the patients in the Pima County General Hospital reacted positively to the coccidioidin cutaneous test, further confirmation that the incidence of infection is fairly high is evident.

The cases selected for review represent all phases of pulmonary infection. Case 1 presented all the signs and symptoms of acute pneumonia. Case 2 was typical of the chronic, progressive phase of the disease known as coccidioidal granuloma. Case 3 represents the acute type of infection which progresses rapidly to cavitation and is indistinguishable from tuberculosis except in the laboratory. That coccidioidal cavities will heal is demonstrated in this case. Case 4 is typical of coccidioidomycosis seen so frequently in the San Joaquin Valley of California. The acute onset with fever, lesions with a roentgenographic appearance not unlike that of bronchopneumonia, and the accompanying erythema nodosum are classic for the "valley fever" type of coccidioidal infection described by Dickson.⁷ Case 5 represents a phase of the disease which I have not seen previously described. This case, with its rapidly fatal course, is no different from any given case of acute hematogenous miliary tuberculosis. The pregnancy may have played an important part in this case, as it so frequently does in tuberculosis.

In a recent paper, Cox and Smith¹⁵ reviewed 4 cases of arrested coccidioidal granuloma coming to autopsy in which factors other than the coccidioides were responsible for death. In all these cases the lesion uniformly consisted of relatively large central masses of partially calcified, caseous material with surrounding sharply outlined capsules of dense, hyalinized connective tissue. Coccidioides spherules were present in these healed lesions in every case. In 1 case cultures of an arrested lesion proved the presence of viable organisms fifteen years after known infection. This picture is not much different from that seen in healed tuberculous lesions.

Storts¹⁶ in his routine pediatric practice has observed a number of children with focal lesions in the lung which may well represent the primary complex of coccidioidal infection. These children are not ill, have positive coccidioidin and negative tuberculin cutaneous tests. The lesions may be located anywhere in the lung and tend to harden as time goes on. In 2 cases which have been followed since 1938 calcification is evident.

During the past year I have observed two dogs with spontaneous coccidioides infection. Their lesions were distributed chiefly in the lungs, liver and spleen. One cannot help speculating on the part these household pets may play in transmitting or disseminating infection.

There is yet much to learn about this disease, particularly the relationship between the acute, self-limited, primary infection and the later, secondary, chronic, highly fatal stage. I would urge physicians throughout the country to acquire an interest in coccidioidomycosis, which may be more prevalent than is realized and which has a not insignificant mortality rate.

CONCLUSION

Evidence is accumulating that foci for coccidioidal infection exist in areas outside California. Five cases of the disease occurred in Arizona and were apparently contracted in this locality. Of these 5, 3 were fatal, 2 during the acute stage of the infection and 1 in the chronic granulomatous stage.

OBSERVATIONS ON THE ETIOLOGY AND
TREATMENT OF MÉNIÈRE'S
SYNDROMEMILES ATKINSON, M.D., F.R.C.S. (ENG.)
NEW YORK

In the past fifteen years a great deal of thought and investigation has been directed toward the cause of Ménière's disease without any entirely satisfactory answer being forthcoming. Many theories have been propounded based on experimental and clinical studies, yet each, when put to the test of therapeutic response, has failed to give complete satisfaction even to its sponsors. The reason for this is, I believe, that always the search has been for one single cause which will suit all cases, whereas it may be that Ménière's disease is not a disease due to one cause but a syndrome which can be produced by at least two causes. I suggest that the characteristic syndrome is the result of a vasomotor disturbance which in one group of cases is allergic in origin and in the other is due to a vasospasm. This paper is an attempt to demonstrate the validity of this hypothesis.

THE MECHANISM

The disturbance, it is assumed, takes place in the inner ear, as Ménière predicated, for here, where cochlea and vestibule are in direct communication in the same closed endolymphatic system, is most readily explained that association of cochlear and vestibular dysfunction which is essential to a diagnosis of the condition. This assumption is today generally accepted, despite some cavilings, and has in the past two years received support from the report of pathologic changes in 3 cases,¹ which will be discussed later.

THE ALLERGIC GROUP

Allergic manifestations in the human body are the result of dilatation of capillaries and an increased permeability of their walls. And they are paroxysmal. Now cases of Ménière's syndrome due to a proved allergy—proved by the patient's response to treatment—have already been reported in the literature, and some of those cases in which patients have been reported cured by dietary regimens may well be examples of this group. Dohlman² recorded 4 cases, 2 due to a specific allergy (1 to milk and 1 to wheat) and 2 due to a "general" allergy, in all 4 of which the patient was relieved of his attacks as the result of treatment directed to the condition. Moreover, in experiments on guinea pigs he has shown³ that a highly constant symptom complex of characteristic vestibular type and one due to an anaphylactic reaction can be elicited by stimulation of the vestibular ganglion. He stated that the results cannot be applied directly to man, but "the fact that in guinea pigs these allergy-

produced symptom complexes originate in the vestibular ganglia does not in any way exclude the possibility that in man the labyrinth takes part in another manner. Variations in allergic sensitivity of organs exist in different species of animals."

Two of my patients afford direct confirmation of the view that allergy is the essential factor in some cases. An elimination diet demonstrated in the one a sensitivity to milk and eggs and in the other to milk and beef. The removal of these foods from the diet resulted in cessation of attacks; the addition of them subsequently was followed by a renewal of attacks. Both patients have been relieved over a period of many months by avoidance of these foods, without other treatment.

Histamine Skin Test.—Since the fact of an allergic disturbance may be regarded as established as a cause of Ménière's syndrome in some cases, it had to be determined how far it was a factor in all. But the discovery of a specific allergen, especially if it is a food-stuff, can be a tedious process, and specific cutaneous tests are admittedly unreliable. Therefore, since there is considerable evidence to show that the manifestations of allergy are possibly due to the release of histamine or of a histamine-like substance into the affected tissues, it was decided, after the suggestion of Dzsinič and Gallé,⁴ to use histamine intradermally as a general indicator and to see how far it was reliable. Thereafter a histamine intradermal test was performed on all patients with Ménière's disease and many others, 0.01 mg. being injected intradermally with a control of the same volume of physiologic solution of sodium chloride. By this means it was found that there was one group of patients with Ménière's disease who were histamine sensitive and another and larger group who were histamine insensitive. The criteria adopted for a positive reaction were a wide area of erythema $1\frac{1}{2}$ to 2 inches [3.8 to 5 cm.], a large wheal ($\frac{1}{2}$ to $\frac{3}{4}$ inch [1.3 to 1.9 cm.])⁵ and the presence of long trailing pseudopodia an inch or more in length which appear in three to five minutes, begin to fade only after twenty minutes and are still apparent at the end of thirty minutes. Small buds at the edge of the main wheal which fade in ten to twenty minutes are not assessed as positive. In a few doubtful cases, when something more than a bud and less than a true pseudopodium appeared, the intradermal test was repeated, 0.02 mg. being used. This always served satisfactorily to separate the sensitive from the insensitive, since those patients who were truly, even if weakly, sensitive showed a decided increase in reaction, while those truly insensitive did not.

Therapeutic Response.—The criteria laid down must be rigidly applied, or mistakes will occur, but when they are rigidly applied the histamine intradermal test has shown itself reliable. In my experience of some 200 tests made in a variety of conditions, no patient who was undoubtedly sensitive has failed to respond to histamine desensitization. Seven histamine-sensitive patients with Ménière's disease other than the 2 already mentioned (who, incidentally, were also histamine-sensitive) have been entirely relieved of their attacks over many months. On the other hand, doubtfully sensitive patients who in an early enthusiasm were read as sensitive and who it was later realized were insensitive, not only failed to respond but were in

From the Department of Surgery, the New York Hospital, and Cornell University Medical College.

Dr. Harold Wolff and Dr. Donal Sheehan gave helpful criticism; Dr. Arthur Palmer and others of my colleagues provided the means to carry out this investigation. Miss E. S. Clark, head nurse of the Ear, Nose and Throat Department helped in this work, and Abbott Laboratories, Hoffmann-La Roche, Inc., and Burroughs Wellcome and Co., Inc., provided liberal supplies of drugs.

5. The size of wheal and the extent of erythema vary greatly with the coloring of the patient's skin, being least in the swarthy and greatest in the fair.

several instances made worse. Moreover, 5 of the 7 patients had a history of generally accepted allergic manifestations in the past, and in all 5 these manifestations have ceased since histamine treatment.

Histamine Attacks.—One patient with Ménière's disease who had a history of "sick headaches" and of food allergy received an intradermal test dose of 0.01 mg. and had a considerable cutaneous reaction. Thirty-five minutes later she had a mild attack, unfortunately not observed. This might have been coincidence, as she was having frequent attacks, but she had none during the next week or following a second injection of the same dose at the end of that time. After another week double the dose, 0.02 mg., was administered intradermally, and again an attack followed, this time after one hour, and again it was not observed. The patient vomited and felt nauseated all day; the same dose repeated caused no distress; the same sequence took place when the dose was doubled. With a slower increase of the dose, reactions diminished and disappeared, and the patient has now not had an attack for eight months as compared with a former three a week.

In 1 other case it was possible to produce an attack by too rapid an increase of the dose, while in 2 more cases slight and transient dizziness was produced, though no actual attack.

These attacks, or near attacks, have been so closely associated with the injections that it is difficult to avoid the conclusion of cause and effect.

It would appear, then, that there is a group of patients with Ménière's disease who are unduly sensitive to histamine, whose sensitivity can be demonstrated by their cutaneous reaction, in whom attacks can be produced by injection of the drug and who can be relieved of their attacks by histamine desensitization. It is therefore concluded that in this group the characteristic syndrome is produced by a reaction in the labyrinth caused by histamine or a histamine-like substance. This reaction is presumably the same as or similar to that produced in the skin—local vascular dilatation and increased capillary permeability.

THE VASOCONSTRICTOR GROUP

The allergic group, however, comprises only a minority of the patients, at least of the patients having classic attacks of Ménière's disease with whom this paper is concerned.⁶ When the histamine-sensitive patients have been subtracted from the total, there is left a majority, in my series 19, who present a negative response to histamine and whose attacks, it is postulated, are due to vasospasm.

The argument for the vasoconstrictor hypothesis runs thus: Among patients with Ménière's syndrome is a group of elderly patients, in their sixties or over, who may reasonably be expected to have degenerative vascular disease and who can be treated, like other patients with degenerative vascular disorders, with some success with vitamin B₁. Thiamine hydrochloride is cholinergic in its action, and at least some of its therapeutic value is due to its vasodilator effect.

If, then, the attacks in this older group may be assumed to be due to a vascular spasm initiated by a local degenerative fault, it is not unreasonable to assume that the attacks in the younger group, attacks which present an almost identical clinical picture, may

also be due to vascular spasm. In this instance, however, they may be produced not, or not necessarily, by a degenerative plaque but by some other local vascular fault the nature of which is at present unknown. Lewis⁷ postulated such a mechanism in recognized vasospastic conditions such as Raynaud's disease, and a similar mechanism may well hold in Ménière's disease. How else explain those occasional knockout attacks, which occur in young as well as in old people, in which the patient is thrown to the ground without warning by some irresistible force, if not by a sudden vascular occlusion temporarily obliterating the function of one labyrinth? Moreover, vascular spasm in varying degree will explain satisfactorily the varying severity of attacks, some mild and fleeting, some severe and prolonged.

With this argument in mind, some clinical experiments were undertaken designed to prove or disprove the foregoing assumption. The resulting observations are not as complete as could be desired and depend for their value as much on the subjective sensations of the patient as on the objective findings of an observer. Such deficiencies are almost inevitable in the investigation of Ménière's disease, in which patient and observer are seldom together or able to come together at the time of an attack except under the special circumstances of a large clinic with a great wealth of material. Nevertheless, in spite of their deficiencies, these observations seem significant.

1. Amyl nitrite pearls were given to 4 patients to be used in the event of an attack. Two patients stated that they stopped four attacks by this means. The results in 1 case were inconclusive because of the fleeting character of the two attacks in which it was tried. The fourth case was instructive. The patient was an intelligent, objective woman aged 28 whose attacks varied greatly in severity. She had used the drug in two severe attacks. On the first occasion she inhaled vigorously with the pearl held close to the nose, so taking a large dose. Dizziness was increased, and she promptly vomited, whereas before the inhalation she had felt merely nauseated. Encouraged to try again, she did so in another severe attack, but having been warned to take a smaller dose and frightened by her previous experience she held the pearl this time some distance from her nose and so took a small, possibly very small, dose. She experienced rapid relief; within five minutes of inhalation a severe attack which she would from previous experience have expected to last half an hour or more had completely subsided. She volunteered the remark that she thought "it all depended on how you smelt it," a cogent observation.

This experiment seems to be identical in its implications with that recorded recently by Wolff and his collaborators⁸ in a case of preheadache scotoma in migraine. They succeeded in abolishing the scotoma with small doses of amyl nitrite sufficient to produce vasodilatation but insufficient to cause a fall in blood pressure. When they used larger doses so that a considerable fall in blood pressure occurred and consequently peripheral blood supply instead of being improved was further impaired, the scotoma increased to a transient amaurosis. The same explanation applies to the case just described.

6. A number of patients with paroxysmal vertigo without the cochlear manifestations—so-called pseudo-Ménière disease, unpleasant term—have proved to be histamine sensitive and have responded to appropriate treatment.

The association of paroxysmal vertigo with migraine was commented on by Ménière himself and has been noted by other observers since his time. Many patients in my series complained of both headaches and attacks of Ménière's disease, and in a certain number there was a definite relationship between the two, the headache following immediately on the dizziness. This was the fact in the case described. The conclusion appears inevitable that there is a proportion of cases in which an attack of Ménière's disease, like a scotoma, constitutes the primary and vasospastic part of a total vasomotor syndrome, of which migraine headache is the secondary and vasodilator part.⁹

2. Acetylcholine, 125 mg., was injected subcutaneously into 1 patient at the height of an attack. There was immediate and complete cessation of the vertigo, a fact vouched for by the physician-husband who gave the injection as well as by the patient. This is a crucial experiment which has not been repeated because unfortunately an opportunity has not been offered.^{9a}

3. By contrast, the patient whose experience with amyl nitrite pearls is described one day took 5 mg. of amphetamine sulfate by mouth, and thirty-five minutes later she was thrown to the ground without warning, suffering a severe attack. On four other occasions she has taken the same dose of 5 mg. and on a fifth 10 mg., but each time the dose was followed a few minutes later by an injection of nicotinic acid, a powerful vasodilator. On none of these has she experienced any ill effect.

4. Epinephrine (1 cc. of a 1:1,000 part solution) was injected subcutaneously in 5 patients in the hope of producing an attack. In all 5 there was a vestibular response within five minutes—nystagmus, pointing error and sway—against the deafer ear. That is to say, function of the vestibule on the affected side had been lowered. None of the patients had an attack, though 1 had a "stuffy" feeling in the ear. Two men took a further dose of 1 cc. ten minutes after the first. The vestibular signs were increased within five minutes, and one patient felt "a little dizzy" while the other felt "like before an attack."

A vasodilator (nicotinic acid) was thereupon administered intramuscularly, and in five minutes the labyrinth syndrome had disappeared, and there was a sensation of relief in the affected ear in the 2 patients who had complained.

A control experiment with epinephrine only was performed on another occasion on the only one of the 5 who was available. The labyrinth reaction again appeared and persisted for thirty-five minutes, with discomfort in the ear for several hours.

It may be objected that the action of epinephrine, however vasoconstrictor in its effect on the skin, is not necessarily so elsewhere, especially in the central nervous system, of which developmentally the inner ear forms a part. Nevertheless, the fact remains that signs which appeared following the administration of this substance disappeared rapidly after the exhibition of a vasodilator but remained for a considerable time when no vasodilator drug was administered.

5. Lack of opportunity has prevented the use of histamine during an acute attack in the way that Shelden and Horton¹⁰ described. They reported

dramatic successes in a series of 11 cases of acute involvement. It would appear from their report that they believe that the results obtained are dependent on a specific action of histamine. In the light of my observations it appears more probable that the results are due not to any specific action but simply to the vasodilator effect of the drug.

The foregoing observations, in conjunction with those of Shelden and Horton, would seem to lend considerable support to the theory that in the vasoconstrictor group the attack is caused by a temporary spasm of the vessels supplying the vestibular apparatus.

Therapeutic Response.—The final proof of a theory in such a case as this depends on the response to treatment. This, as will be seen later, is in general satisfactory. Briefly, of 19 patients treated with vasodilator drugs over a sufficient period to justify assessment of results 17 have been completely relieved or are steadily improving, while 2 who showed an initial improvement eventually had a relapse.

The Pathologic Evidence.—To complete the picture, this theory must be correlated with the histologic findings of Hallpike¹ in 3 cases which came to autopsy in each of which he found "a gross distention of the endolymphatic system together with degenerative changes in the sensory elements." The clinical information given is insufficient to place the cases mentioned for certain in their respective categories, but the first 2 are probably vasospastic, and the third suggests in many of its features an allergic basis for the disease. However, the inability to classify them correctly is unimportant, since the two groups may be expected to produce the same appearance post mortem.

The circulation of the endolymph represents a chapter in physiology which remains to be written. All that is known for certain is that the endolymph is absorbed in the sacculus endolymphaticus.¹¹ Experimental proof of its manner of production is lacking on account of technical difficulties which have still to be overcome. By analogy, however, with the aqueous humor in the eye and with the cerebrospinal fluid, both fluids produced in closed systems and so strictly comparable, it is not unreasonable to suppose that the endolymph is a dialysate produced by the stria vascularis, a capillary tuft situated in the cochlea close to the organ of Corti. If this is so, the quantity of endolymph will depend on variations in the blood flow in the capillaries forming the stria—the more dilated the capillaries the greater the quantity of endolymph, provided blood pressure does not fall, and vice versa.

The primary allergic or histamine mechanism of an attack is simple to explain. The allergic process is a familiar one—the production of local edema from dilatation of arterioles and increased permeability of the walls of the capillaries. An increased quantity of endolymph under such conditions corresponds to local cellular edema. As this excess is formed and pressure increases the whole cochlea will be damped down—hence the increasing deafness involving all tones, deafness which precedes the attack and is relieved by it. Hence also, by repeated insult, the eventual cochlear degeneration. This damping down will affect in the same way the vestibule, decrease its sensitivity and put it out of balance with its fellow on the other side, until eventually the discrepancy oversteps the possibilities of compensation and an attack of vertigo results.

Labyrinthine vertigo is only an expression of imbalance between the two sides.

In the primary vasoconstrictor group, though the mechanism of an attack is different the ultimate results in the labyrinth are much the same, and it is this similarity which causes the difficulty in distinguishing the two groups, both clinically and pathologically. Clinically the same syndrome of labyrinth imbalance may be expected whether the decreased sensitivity is caused by the damping effect of an excess of endolymph or by a temporarily insufficient blood supply from vascular spasm. Pathologically also the same appearance may be expected in the dead subject in the two groups—dilatation of the endolymphatic space. In the one case the excess of endolymph will be due to a primary dilatation of the capillaries of the stria; in the other it will be due to a secondary dilatation following the primary constriction, analogous to the secondary dilatation which follows the primary spasm in Raynaud's disease. Similarly the cochlear degeneration, which could be the result of recurrent anoxemia or of recurrent excesses of endolymph, is perhaps something of both. If this concept is correct, it provides also an explanation for the aftermath of unsteadiness and the increase of deafness which follow the attack in the vasoconstrictor group. In the two groups, therefore, the postmortem picture will be the same, though in the second it is a picture not of the actual pathologic process but only of its result.

COMMENT

The theory of a vasomotor basis for the phenomenon of attacks of Ménière's disease is not new. Such a basis was suggested originally by Portmann¹² and again later by Mygind and Dederding,¹³ whose work on water metabolism, supported by a mass of collateral clinical evidence, is the most complete exposition of the syndrome to date. These authors did not, however, envisage the dual mechanism which, if accepted, clears away many or all of the previous difficulties.

But to say merely that the clinical manifestations known as Ménière's syndrome can be produced by the mechanism of allergy on the one hand and of vasospasm on the other is to reduce the condition to one of apparent simplicity which in fact it is far from being. Both processes are incompletely understood. Leaving aside allergy, about which a good deal is known, the phenomenon of vasospasm presents problems of causation which have scarcely begun to be understood. It is well enough to say that attacks of Ménière's disease have been shown to be produced by vasospasm in many cases, but it still remains to be shown why that vasospasm occurs. That the sympathetic nervous system plays a part is certain, and there is much clinical evidence to show that, in the condition under discussion, that part is an important one. How important it is, and what its relation is to the factors of water metabolism and electrolyte balance which have engaged the attention of other workers¹⁴ is not yet clear. It may even be that focal infection, so ardently stressed of late by Wright,¹⁵ is in some cases a contributory

factor in the vasospasm, though I confess that I view the hypothesis in this as in other fields with great mistrust. That "post hoc" is "ergo propter" is more difficult to demonstrate in this, perhaps, than in any other field of therapy.

DIFFERENTIAL DIAGNOSIS

It is a truism to say that the efficient treatment of a disease depends on an understanding of the underlying pathologic process. Without that knowledge treatment, though it may be successful, must be empiric. The treatment of Ménière's syndrome in the past has been an outstanding example of such enforced empiricism. The evidence just put forward, however, points the way, it is believed, to a more rational therapy on the basis that the phenomena of Ménière's syndrome can be produced by the two distinct factors of allergy and vascular spasm. Each case must therefore be placed in its correct category before a logical line of therapy can be adopted.

THE CLINICAL CHARACTERISTICS OF THE TWO GROUPS

Members of the allergic group, as has been shown in the previous section, give a positive cutaneous reaction with histamine. More than that, they have, as I have shown elsewhere,¹⁶ a diminished sensitivity of the labyrinth on the affected side when sensitivity is changed and an audiogram characteristic of a hearing loss of conductive type and usually of minor degree. Members of the vasospastic group, on the other hand, give a negative cutaneous reaction to histamine. They have consistently increased vestibular sensitivity except in a few cases of long standing, when it is diminished, and the audiograms show a hearing loss of perceptive or mixed type and often of severe degree even in young patients. In addition to these mechanical aids to differentiation there are certain points of difference in the histories of the two groups which will often enable the careful inquirer to separate his cases.

1. The allergic group is a young group, the average age in my series (9 cases) being 30 years at the time of onset of the disease. Women predominate (8 to 1 in my series). The hearing loss, as has been said, is not great, nor is the tinnitus severe. The attack is commonly preceded by a warning. This is scarcely a definite aura, but patients often know some hours beforehand that an attack impends. Hearing gets worse, tinnitus increases, they suffer a severe headache which from being at first local and unilateral on the deafer side becomes general until suddenly there is a sensation of "something bursting" or "something happening" in the head and the attack is on. The acuteness of it passes in half an hour or so, the attack often being terminated by vomiting, and there is little or no aftermath of unsteadiness. After the attack, headache and hearing improve rapidly and tinnitus diminishes again to its former level. This is the syndrome described by Lermoyez as "the vertigo which makes one hear."

Here is a description in the words of a woman aged 30: "For twenty-four hours before, I feel irritable and cross and am very unpleasant to people. About half an hour before the attack starts I feel very tired and old. Then a few minutes before the attack there comes a sensation of something cold at the back of my head which spreads forwards over the top. At the same time I have a bursting feeling in my ears, my hearing

becomes much worse and the noises very loud. Suddenly something seems to burst in my head and everything is spinning round. When it is over I feel very exhausted and must sleep for two or three hours. Then I am quite well again and my hearing and noises return to the same as before."

2. The vasospastic group, in general, is an older group, the average age in my series of 19 patients being 42. But this group divides itself clinically, in its response to treatment, and possibly also etiologically, so far as the vasospasm is concerned, into three classes.

(a) First there is a small number of young patients, usually in the twenties at onset (1 in my series was only 15). These have severe and rapidly progressive symptoms as regards attacks, deafness and tinnitus, and they are often resistant to treatment. They are more often women than men (4 out of 6) and in this and other ways bear a resemblance to patients with Raynaud's disease. For instance, 3 of my patients are susceptible to low temperatures, and their attacks are more frequent in cold weather. Emotional disturbances sometimes cause an attack, as when in one instance a woman's child unexpectedly emitted an ear-piercing scream immediately behind her. And the lesion, or rather the deafness, is usually bilateral, though more severe on one side.

(b) Then there is a large class of the middle-aged, from 35 to 50 or so, who are amenable to medical treatment. Their attacks tend to come in batches—they may have two or three during a week or a month and then a long interval, even a year or more, of freedom, but the general course is toward deterioration, as regards the severity both of attacks and of deafness. These patients seem to belong in a classification with that large group of the middle-aged who suffer vascular disorders. Three of my patients had experienced attacks which were called coronary attacks, though without characteristic electrocardiographic changes, and the attacks of vertigo in this class frequently occur, like coronary attacks, while the patient is at rest or asleep. Some patients have been labeled as having hyperpiesis or essential hypertension; yet their blood pressure, though varying perhaps considerably from examination to examination, is seldom more than moderately raised—140 systolic or thereabouts. Several have been better when leading active rather than sedentary lives. The complaint of cramps in the limbs is not uncommon, and the illness of 2 of my patients has been diagnosed as thromboangiitis obliterans. Previous abdominal operations are common, especially on the gallbladder, yet the results are disappointing—the relation of the spastic appendix and gallbladder to Ménière's disease still apparently is not generally appreciated.

(c) Finally there is the class of the elderly, aged 60 and upward, with characteristic progressive senile deafness and mild tinnitus who often say that their attacks are gradually decreasing in severity and frequency, whence comes the statement, often heard though without foundation as far as my own experience goes, that when hearing is totally lost the attacks cease. This class also is usually amenable to medical treatment.

Contrasting the vasospastic group as a whole with the allergic one, it may be said that the deafness experienced by it is more severe and the tinnitus more troublesome. Vertigo, however, takes three forms, often, and especially in the first two varieties, in the same patient. There are momentary attacks, lasting a matter of seconds, sometimes very frequent and perhaps leading up

to a major attack; major and prostrating attacks, and rare "knockout" attacks in which the patient is cast incontinently to the ground. Each of these depends presumably on a varying degree and duration of vasospasm. There is no aura; the attack comes as a "bolt from the blue." And when the attack is over hearing is found to be lessened, tinnitus is worse and there is often an aftermath of unsteadiness which persists for a varying time, sometimes as long as three or four days. In short, whereas the attack in the allergic group makes things better, in the vasospastic group it definitely makes them worse.

The cause of the spasm is probably different in the three classes. The cause of the spasm in Raynaud's disease is almost certainly not the same as that in coronary spasm or in thromboangiitis obliterans, though in none of them is the actual basic cause yet known. Sympathetic nervous control undoubtedly plays a part, though not necessarily the whole part, in these conditions, and perhaps to a different extent in the young and in the middle-aged. In Ménière's syndrome, water metabolism and electrolyte balance¹⁷ are known to have their share of influence, and perhaps they have in others. And, if the analogy is just, so may the sympathetic nervous system have influence in Ménière's disease.

The disease of the third, elderly, group presumably owes its origin to a sclerotic plaque, a senile degenerative process, as the local fault which initiates the spasm. It is generally believed that a high blood pressure is an important contributory cause in the disease of these elderly patients. This is not the case. Indeed, some of them have an unduly low pressure and are helped by measures designed to raise it. The dizziness of the person with true hyperpiesis, the sufferer from generalized arteriosclerosis, is a mild but fairly constant dizziness increased by sudden changes of position, in contrast with the severe and incapacitating paroxysms of Ménière's disease.

TREATMENT

THE ALLERGIC GROUP

The ideal treatment is to discover and remove, or desensitize against, the specific allergen. In 2 cases in my series the discovery was made (in the one case the antigen was milk and eggs and in the other milk and veal), and both patients have been relieved of attacks over ten to twelve months respectively. I say "relieved" deliberately, because to speak of cure of Ménière's disease in any time under a term of years is, I believe, presumptuous, knowing, as everybody does, the long intervals of remission that may occur. The remainder (7 patients) have been treated by histamine desensitization according to the method suggested by Dzsinić and Gallé.⁴ The principle of this treatment is that, assuming that allergic symptoms are the result of hypersensitivity to histamine, desensitization of the subject to this substance will relieve him of further attacks. Starting with the same dose subcutaneously as in the intradermal test (0.01 mg.), patients are worked up in slowly increasing doses twice or at most three times weekly to the limit of tolerance, which has been as a maximum 1 mg. and sometimes less. They are then maintained at top dose once a week for a month. A second short course after a three months interval is advisable.

The results have been most satisfactory, so satisfactory, indeed, that I have come to regard the placing of a patient in the allergic group as being as much a

17. Mygind and Dederding.¹³ Furstenburg, Lashmet and Lathrop.¹⁴ Talbot and Brown.¹⁵

prognosis as a diagnosis. Treatment in all of the 7 cases has been successful as regards relief of vertigo. Attacks, sometimes very frequent attacks, have ceased in all cases. Moreover, on three occasions an attack produced by overdosage has been immediately stopped by the exhibition of epinephrine—strong proof of the allergic mechanism. Unfortunately the opportunity has never arisen of determining the action of epinephrine in the course of a spontaneous attack in a member of this group. It should act just as dramatically.^{17a}

The paroxysms of vertigo are not the only symptoms that are relieved. Headaches from which most patients (7 out of 9) suffer disappear completely or become infrequent and mild. One woman who used to have sneezing attacks, especially when cleaning her house, now sneezes scarcely at all. As striking as anything is the improvement in general condition. Patients feel better; their color improves; they put on weight (sometimes to their considerable distress in these "slim" days) and their mental outlook changes. Dzsinič and Gallé⁴ also commented on this feature, although they found little if any change in such laboratory findings as eosinophilia and lymphocytosis, the complement titer or cholesteremia. No confirmation of these laboratory observations has been attempted.

Deafness and tinnitus have not been so uniformly helped. Improvement in these symptoms depends largely on the length of time that they have been in existence. Thus of 3 patients who had no improvement in either symptom, 2 had complained for twenty years; the third had suffered many and severe attacks at intervals for three years. On the other hand, 3 patients whose symptoms had been in existence under a year had decided improvement in both, and one had complete cessation of tinnitus. In fact, the longer the duration of the insult, the more irreparable the damage.

THE VASOCONSTRICTOR GROUP

Various dilator drugs of the nitric group were tried in the search for a satisfactory vasodilator. Glyceryl trinitrate was the most effective of these, particularly in older patients, but it must be given in large doses, $\frac{1}{50}$ grain (0.0012 Gm.) three times a day or more. It is a drug of which I am unduly afraid. But even in adequate doses it is not an invariable success, even if used, as it must be, over long periods. Prostigmine methylsulfate, another vasodilator, was tried in 5 cases, partly because of its reported success in the treatment of chronic deafness. It achieved spectacular success in 1 patient, a man aged 48, but was entirely unsuccessful in the other 4. Even in the successful case, a mild one, there were other factors which might have influenced the result. Finally vitamin B, first the whole complex, later individual constituents, was tried and proved more satisfactory than any other substance, in particular the nicotinic acid fraction, which is a powerful dilator, at least of peripheral vessels. After a good deal of therapeutic trial and error it became possible to formulate certain general principles and to establish a routine.

The Nicotinic Acid-Thiamine Hydrochloride Treatment: Some General Principles.—1. Some patients react perfectly well to oral administration, but many do not, and the improvement in results when parenteral administration is substituted may be striking. I cannot agree with those observers who say that oral administration is as effective as parenteral, averse though I am to the needle as a routine.

2. Therefore it is advisable always to begin with parenteral administration unless the patient objects too strongly, in which case he may often be converted later.

3. In the young and middle-aged, nicotinic acid is the active substance responsible for results. It is only necessary to dilute it with thiamine hydrochloride and observe the deterioration in results to establish this. The importance of nicotinic acid in the vitamin B treatment of certain forms of deafness has been pointed out by Selfridge,¹⁸ and it applies equally to Ménière's syndrome.

4. In the elderly, on the other hand, the sedate action of thiamine hydrochloride is the more important. Old people do not tolerate well drastic dilatation.

5. In all cases patience and perseverance are incumbent on both patient and physician.

6. A high protein-high vitamin diet is important, as well as an active life suitable to the patient's age, and since Ménière's disease is a vasospastic condition smoking should be forbidden.

ROUTINE

1. *Nicotinic Acid.*—This, as has been said, is the important fraction of the vitamin B complex for the young and middle-aged patients, but it must be insisted that there is no rule of thumb for its administration. Dosage is essentially individual. Whereas one will accept with equanimity 100 mg. parenterally every day,

Three Mixtures of Nicotinic Acid and Thiamine Hydrochloride, Milligrams per Cubic Centimeter

	Mixture 1	Mixture 2	Mixture 3
Nicotinic acid	45	40	25
Thiamine hydrochloride....	5	10	25

another will tolerate only 20 mg.¹⁹ The principle is to push each patient to the limit of his tolerance, maintain him there as long as necessary (always a matter of months) and then gradually diminish the dose to a maintenance dose, which may be oral. The indications for reduction of the dose are excessive "flush" reaction, headache, nausea and lassitude from a fall in blood pressure.

In general, it may be said that the middle-aged class requires and tolerates the largest dose, 50 mg. and more parenterally daily; the young class has to be approached cautiously with 25 mg. daily, which can often be considerably increased if caution is observed, while the old group is usually intolerant of anything but small doses, 10 to 20 mg. It would seem as if the sensitive vasomotor mechanism of the young and the inelastic vessels of the old are intolerant of nicotinic acid in high dosage, while the middle-aged vasomotor system, of declining resilience, reacts well to an enforced increase of activity.

2. *Thiamine Hydrochloride.*—This vitamin is used in almost reverse fashion. The dose that is necessary becomes larger with the age of the patient, until in the old it should be used in plentiful amounts of 10 to 25 mg. daily, perhaps even to the exclusion of nicotinic acid. The enormous doses fashionable today are unnecessary and wasteful. After a time varying with each patient a change may be made to oral medication, but

18. Selfridge, Grant: Nicotinic Acid and the Eighth Nerve: A Preliminary Report, *Ann. Otol., Rhin. & Laryng.* 48:39 (March) 1939.

19. This idiosyncrasy has been found also in the treatment of pellagra with nicotinic acid. Cf. Spies, T. D.; Grant, J. M.; Stone, R. E., and McLester, J. B.: Recent Observations on the Treatment of Six Hundred Pellagrins with Special Emphasis on the Use of Nicotinic Acid in Prophylaxis, *South. M. J.* 31:1231 (Dec.) 1938.

17a. Since this paper was written an attack in a histamine-sensitive patient has been stopped by ergotamine tartrate.

for a year at least, and possibly for the rest of his life, the patient should continue with a maintenance dose of 3 mg. daily.

It has become routine to start with a mixture of two substances, varying the quantities according to the patient's need, but the three mixtures given in the accompanying table have a wide sphere of usefulness.

It would seem wise, under the present limitation of knowledge, to repeat from time to time short courses of injections lest relapse take place, but how often or over what period of time these should be continued has not at present been established. Probably here also there is no rule of thumb. It is even possible, if Ménière's disease is a condition of true deficiency, that substitution therapy will have to continue always.

Results: These, as has been said before, must be estimated cautiously, in view of the patient's tendency to relapse. Even viewed conservatively, however, the results I have obtained seem satisfactory. They are more convincing to witness than they may appear on paper, and with increasing experience they grow better. Of 19 patients in the vasoconstrictor group who have been under treatment sufficiently long (six months or more), 8 have been entirely relieved of attacks for such time, compared with their intervals before treatment, as to make one hopeful of a permanent result. Of the remaining 11, 9 have been improved. In all these, attacks have been greatly lessened in frequency and severity and are continuing to diminish; in some, attacks have ceased, but too recently (within less than six months) for it to be justifiable to class them as relieved. The remaining 2 both had a relapse after an initial improvement. One, a man aged 66, had a nerve section with satisfactory result; the other, a man aged 36, has been lost sight of.

If steady improvement merits the designation satisfactory, despite in some cases occasional attacks which are diminishing in frequency and severity, it can be said that 17 out of 19 patients have reacted satisfactorily to the treatment described. There have been two failures. Other patients who have been under treatment too short a time to be included here bear out my observations as to both diagnosis and treatment. Good results with treatment on similar lines have been reported recently by Harris and Moore, though they have not classified their cases.²⁰

The Action of Nicotinic Acid.—I am competent to discuss the action of nicotinic acid only so far as the results of my own clinical observations go.

There is no doubt about the vasodilator action of nicotinic acid or the fact that its action is on the smallest vessels or the capillaries. Flushing of the face is observed in a majority of patients within three minutes of an intramuscular injection and is often much more extensive, involving the neck, upper part of the trunk (back and front), the upper arms, sometimes even the hands, knees and feet. Even those who show no obvious flush have a sensation of warmth. It was said by Elvehjem²¹ that this flush reaction is due to the acidity and that if the p_H is adjusted it does not occur. I have been using an organic salt²² whose p_H is on the alkaline side between 8 and 9, and still the flush occurs.

Some patients flush severely, some mildly, some occasionally; some who flush at first gradually lose the reac-

tion. The explanation may be that flushing denotes a deficiency, but I have not been able to satisfy myself of any difference in the therapeutic efficiency of nicotinic acid on those who flush and on those who do not. It is not known, in fact, whether there is any specificity, apart from its use in the treatment of pellagra, in the action of nicotinic acid—whether, for instance, it is an essential factor in a normally functioning autonomic nervous system and so supplies a deficiency, as seems possible, or whether it works purely by virtue of its vasodilator action. Nor is it known as yet at what precise point in the vasomotor mechanism nicotinic acid has its action. These are matters under investigation.

Histamine and Nicotinic Acid.—A warning must be given against indiscriminate use of these substances. Histamine, or a closely allied substance, is believed to be the specific agent in producing the manifestations of allergy, and its use in histamine-sensitive patients in small desensitizing doses is therefore rational. But because of its vasodilator action histamine in larger doses is effective also in vasoconstrictor conditions, as in acute paroxysms of Ménière's disease of vasospastic type¹⁰ or certain forms of vasospastic headache,²³ and even at first in small doses it may produce improvement and hence encouragement. If persisted in with the wrong patient and in desensitizing doses, it can do much harm. I speak from the experience of having done precisely this and produced an instability in the patient's condition which it has taken a long time to overcome.

In the same way, nicotinic acid or any dilator drug given to one of the histamine-sensitive group causes increased attacks and general deterioration. This also I have done.

Only if histamine and nicotinic acid are employed with a full appreciation of their mode of action and a knowledge of the type of case in which they are to be used can satisfactory results be expected. Unless these conditions are fulfilled there will arise distress for the patient and disappointment for the physician.

Other Methods of Treatment.—In the vasoconstrictor group treatment has been confined in my series purposely to one method. This group has been treated by the means described and by that means alone in an attempt to prove or disprove the vasospastic theory. No limitation of fluids or alteration of sodium-potassium intake was attempted, methods which, alone, have proved disappointing in my hands. Nevertheless there is sufficient evidence to suggest that such disturbances play a part in the causation of Ménière's disease, perhaps to a different extent in the different classes, and that a complete system of therapy must take them into consideration. Their influence will need further investigation.

Eustachian stricture, too, is a frequent finding and should be looked for carefully. When present, it should be treated energetically on the same principles as a urethral stricture. Despite the skeptics, this treatment alone suffices for cure in a number of cases, presumably by restoring normal pressure conditions in the middle ear, and perhaps to some extent by virtue of its massage effect.

The infective theory I view, as I have said, with great skepticism. It may well be that a generalized low grade infection may cause an increased sensitivity of the vasomotor mechanism and so tip the balance to

vasospasm. Certainly a gross infection should be eradicated on general principles. But to add Ménière's syndrome to the list, already far too long, of conditions which can be relieved by the surgical removal of some more or less hypothetic focus of infection is in my opinion quite unjustifiable.

CHANGES IN SERUM PROTEIN AND HEMOCONCENTRATION IN MAN

FOLLOWING TRANSFUSION OF A SOLUTION
OF DRIED BLOOD PLASMA

SAMUEL B. HARPER, M.D.

Fellow in Surgery, Mayo Foundation

ARNOLD E. OSTERBERG, PH.D.

JAMES T. PRIESTLEY, M.D.

AND

THOMAS H. SELDON, M.D.

ROCHESTER, MINN.

Many authors have shown recently that blood plasma approaches the ideal perfusion medium to be used in combating hemoconcentration and restoring an effective blood volume in the treatment of peripheral circulatory failure occurring in traumatic shock, in severe burns and after hemorrhage.¹ The importance of proper methods for preserving plasma until needed for transfusion is obvious. The preservation of plasma by refrigeration or the addition of chemical preservatives has been attended with gratifying results.² However, there are certain advantages to be obtained by removing the water and storing the plasma as a dry residue. The dangers of contamination or loss during storage and transit are considerably less under such circumstances. There is evidence that the dried residue represents the most stable form.³ Furthermore, it is possible to prepare concentrated hypertonic plasma or more dilute solutions as the need may be.

Recently a simple method for the preparation of dried plasma and the result of its experimental use were reported from this laboratory.⁴ Accordingly, at this time the results of the clinical use will be presented.

METHODS

The plasma used in this study was obtained from freshly drawn group IV (O) blood and was dried to a flaky residue by the method previously described.⁴ This consists, briefly, in continuous simple distillation of fluid plasma while it is sprayed into a distilling flask maintained at a reduced pressure of approximately 15 mm. of mercury and at 45 C. It is possible to obtain

very rapid dehydration of the plasma at a minimal cost for equipment or operating expense.

Before removal of the plasma residue from the drying flask and after completion of the drying process about 20 Gm. of dry sterile dextrose is added to the residue of 1 liter of plasma. When the flask is shaken nearly all the plasma residue falls from the sides and becomes well mixed with the dextrose. The dry dextrose added after drying the plasma serves as a dispersion medium and greatly increases the rate of solubility of the product. Plasma solution sufficient for a transfusion can be prepared in a few minutes after the addition of sterile water.

Dried plasma prepared by this method has a residual water content of 3 to 8 per cent.⁵ Further drying occurs during storage at room temperature in open containers protected from contamination by a covering of several layers of gauze. After ten weeks' storage in this manner there has not been deterioration, as evidenced by changes in physical or chemical properties or by untoward effects following clinical use. Representative composition of the dried plasma is presented in table 1.

An arbitrary dose of plasma-dextrose mixture consisting of approximately 40 Gm. of plasma residue and

8 Gm. of dextrose is dissolved in 400 cc. of sterile distilled water for each transfusion. This solution is the equivalent of about 450 cc. of fresh plasma in protein content. The addition of 600 mg. of sodium sulfathiazole serves as a satisfactory preservative. Solutions of plasma used as long as twelve days after preparation are not attended by untoward effects. Samples of plasma known to be contaminated with a variety of organisms have been sterile on subsequent culture a few days after the addition of sodium sulfathiazole in the amounts indicated.

Studies directed at determining the effectiveness of a solution of dried plasma in increasing the plasma volume and protein concentration were performed on a series of fourteen patients who received a total of nineteen transfusions of the plasma solution. The indications for transfusion of plasma varied from postoperative vascular collapse to hypoproteinemia dependent on a number of causes. The hematocrit,⁶ the total serum protein and the albumin-globulin ratio⁷ were taken as criteria of the concentration of the cellular elements of the blood stream and of the plasma proteins

respectively. Blood samples for these determinations were drawn immediately before and ten minutes after the transfusion and again during the first few days following transfusion. In addition, frequent determinations of the blood pressure, pulse and respiration were performed. In a few cases urinary excretion of nitrogen and protein was studied.

RESULTS

The results of the blood studies are presented in table 2. The hematocrit level following transfusion is lower than the initial level in all cases, indicating dilution of the cellular elements of the blood and an increase in the volume of plasma. A comparison of the protein levels before and immediately after transfusion shows that a corresponding diminution of the

the changes in plasma volume which depended on the transfusion of plasma, since an accurate record of fluid intake by other means was not obtained. However, in those cases in which the patient did not receive other intravenous fluids following the transfusion the hematocrit remained below the level before transfusion for a period up to four days. At the same time the serum protein level showed a gradual, but slight, rise after transfusion.

It will be seen from the wide variation of degree and duration of the changes observed that the results are not to be explained by simple addition and dilution as in vitro. This is in accord with the findings of a number of authors who have studied the effects of serum and plasma transfusions.⁸ There are a number of determining factors. As has been pointed out, a

* After transfusion when last sample was obtained.

serum protein concentration does not occur. It would appear that the increase in plasma volume as interpreted from the lowering of the hematocrit depends on the addition of protein as well as fluid to the circulating plasma. Since in the plasma solution injected the concentration of protein was always slightly higher than in the plasma of the recipient, a rise in the serum protein level after transfusion can be understood. In those instances in which the concentration of serum protein is lowered following transfusion, the percentage drop is never as great as the percentage drop in the hematocrit. Thus there is actually a rise in the relative amount of protein and undoubtedly in the absolute amount of total circulating plasma protein.

Hematocrit and serum protein determinations taken from twelve hours to several days after plasma transfusion indicate that the initial changes are maintained for some time. From the values observed in this study it is not possible to determine the exact duration of

portion of the injected protein is lost from the blood stream and simultaneously water is drawn into the circulation from the tissues. The loss of protein as determined in this study may be more apparent than real. The increase in plasma volume following the injection of plasma may be partially compensated for by the addition of more cellular elements to the active circulation from regions in the body where circulation is slow. Thus McAllister⁹ found that plasma loss as

calculated from the hematocrit was nearly double the value obtained by plasma volume determinations when the dye method was used.

That a loss of protein does occur is apparent from the values for serum protein concentration taken several days after transfusion. In several of the cases reported here the 40 Gm. of plasma residue injected contained more than half as much protein as the amount of protein calculated to be circulating in the plasma. The slightness of the rise in concentration of serum protein can be accounted for only by the assumption that some protein must have left the blood stream.

The loss of protein is understood more easily by realizing that the proteins of the plasma are probably in a state of equilibrium with the tissue proteins.¹⁰ The changes in serum protein and hematocrit following the injection of plasma are not predictable and depend on many factors which are not well understood.

While the complete explanation of the changes in serum protein concentration and hematocrit following the transfusion of plasma is lacking, the practical significance of these changes is illustrated by case 3

The effectiveness of solution of dried plasma in elevating blood pressure in shock after failure of solutions of acacia and dextrose. White man, aged 63. Exploratory laparotomy, inoperable carcinomatosis.

(shown in the chart). The signs and symptoms of peripheral circulatory failure developed after exploratory laparotomy, at which time inoperable carcinomatosis was found. The intravenous administration of 275 cc. of 6 per cent solution of acacia and 700 cc. of 5 per cent solution of dextrose was not followed by any sustained elevation of the low blood pressure. Shortly after the intravenous administration of 400 cc. of solution of dried plasma was started there was a striking improvement in the patient's general condition and a prompt return of the blood pressure to the preoperative level. There was a rather significant lowering of the hematocrit following the transfusion coincident with an elevation of the lowered blood pressure to the preoperative level. An effective increase in the volume of circulating plasma following the transfusion of solution of dried plasma is probably the explanation for

this. It is interesting to note the failure of solution of either acacia or dextrose to produce any sustained elevation of the lowered blood pressure. Comparable findings were obtained in the other cases in which treatment was given for postoperative shock.

REACTIONS

In three instances untoward symptoms were noted following the transfusion of solutions of dried plasma. Two patients complained of slight backache during the administration of plasma at a rate of about 25 cc. a minute. Following slowing of the rate the remainder of the transfusion was administered without further complaints. In both of these cases fever developed, the temperature reaching a maximum of 102 F. three hours after the transfusion and returning to normal four hours later. It was thought that in these cases the rapid administration of plasma obtained from group IV (O) blood to recipients having II (A) blood may have been an important factor in producing the reaction. Strumia, Wagner and Monaghan¹¹ have recommended that a rate of 5 cc. a minute be observed.

One patient had extensive edema and ascites and was moribund at the time of transfusion. Pulmonary edema developed after the administration of 150 cc. of solution of dried plasma at a rate of 2 cc. a minute. Although this patient died fifteen hours later, it was felt that the development of progressive pulmonary edema represented the terminal extension of the ascites and edema to the pulmonary system rather than an acute process dependent on a sudden increase in the blood volume due to the small transfusion of plasma.

Since a number of patients were febrile at the time of plasma transfusion it was not possible to determine in all instances the degree of fever following transfusion of solutions of dried plasma. However, in those cases in which there was no fever at the time of transfusion there was a variation of only 0.5 degree F. in the twenty-four hour period following transfusion of 400 cc. of plasma solution.

SUMMARY

From the evidence presented it appears that spray distillation under reduced pressure of approximately 15 mm. of mercury at 45 C. is an effective method for preparing human plasma in a dry state. This method is simple, rapid and economical. The addition of dry dextrose as a dispersing medium greatly increases the rate of solubility of the plasma residue. The use of sodium sulfathiazole as a preservative agent is effective in preventing bacterial growth in the solution of dried plasma. Thus it is possible to prepare plasma solutions several days before they are needed for use and an available small bank of plasma solution may be obtained.

The dried plasma residue obtained by spray distillation does not show evidence of significant alteration or deterioration during either the drying process or storage for ten weeks exposed to air and at room temperature. Solutions of such plasma possess properties comparable to those of fresh plasma in respect to the ability to increase the plasma volume and the total circulating plasma protein and to reduce hemoconcentration. That such properties are important from the practical side was shown by successful treatment of a patient with postoperative shock.

ANTEPARTUM USE OF VITAMIN K IN THE PREVENTION OF PROTHROMBIN DEFICIENCY IN THE NEWBORN

GEORGE P. BOHLENDER, M.D.
WILLIAM M. ROSENBAUM, M.D.
AND
EARL C. SAGE, M.D.
OMAHA

In an effort to evaluate the efficacy of vitamin K in the prevention of transient prothrombin deficiency in newborn infants and in the possible prevention of intracranial hemorrhage and hemorrhagic disease of the newborn, we report a study of 50 infants whose mothers were treated with vitamin K prior to delivery. The product used was 4-amino-2-methyl-1-naphthol hydrochloride, a synthetic preparation having vitamin K activity, 1 mg. per cubic centimeter,¹ administered parenterally.

Dam and his associates² reported that in normal children avitaminosis K, usually moderate, develops in the first days after birth and disappears after a week. Nygaard³ stated that a normal prothrombin time is maintained during the first ten hours after delivery but that definite reduction of the prothrombin content becomes apparent during the second half of the first day. This low level is continued during the following five days. From the sixth day prothrombin returns to the level found at the time of birth. Studies on the prothrombin content of the blood of some of the newborn infants with hemorrhage disclosed that in the majority of cases the onset of hemorrhage coincides with the period of transitory hypoprothrombinemia. Warner, Brinkhous and Smith⁴ expressed the belief that the prothrombin level is low at the time of birth and that about the third or fourth day of life the level falls still more. They also expressed the belief that intracranial hemorrhage develops in some cases on the third or fourth day of life when the tendency to bleeding is greatest. Quick and Grossman⁵ studied the prothrombin concentration of the blood of newborn infants and concluded that at birth the level of prothrombin in the infant's blood is relatively high but often drops precipitously during the first days of life and then is restored spontaneously. The frequency with which the prothrombin level falls in normal infants makes it highly probable that all infants are in danger of hemorrhage during the first few days of life. These investigators expressed the belief that the cause of prothrombin deficiency is an inadequate storage of prothrombin or of vitamin K in the fetus. The condition is clearly due to a lack of vitamin K, since the prothrombin can be restored promptly to normal by giving the baby an oral preparation of this vitamin. A serious fall in concentration may thus be prevented. Shettles, Delfs and Hellman⁶ concluded from their

studies that the plasma prothrombin level of the newborn infant can be raised not only by feeding vitamin K preparation directly to the infant after birth but also by administering it to the mother prior to delivery. The prothrombin levels of newborn infants obtained by administration of the drug to mothers were often three times as high as those usually seen and also were higher than those levels which could be attained by administering vitamin K preparation to the infant after birth. Waddell and Guerry⁷ reported on the prothrombin and clotting times of the blood of 20 newborn infants; 10 were used as controls and 10 received vitamin K preparation by mouth. In the 10 infants receiving the vitamin K preparation there was a prompt reduction in the prothrombin and clotting times, these infants having more plasma prothrombin than those in the control group. The same investigators⁸ later reported 4 cases of subclinical hemorrhagic disease associated with high prothrombin time. In each instance vitamin K preparation administered by mouth promptly reduced the prothrombin time to a safe and normal level within a few hours.

MECHANISM OF THE COAGULATION OF BLOOD

The most logical concept of coagulation is the one proposed by Morawitz⁹ and now widely accepted. According to his theory, four agents are required for the clotting of blood: prothrombin, thromboplastin, calcium and fibrinogen. The first three interact to form an active enzyme (thrombin) which reacts with fibrinogen, changing it to an insoluble gel (fibrin), which constitutes the clot. The process can be expressed as occurring in two steps:

1. Prothrombin plus thromboplastin plus calcium equals thrombin.
2. Fibrinogen plus thrombin equals fibrin.

Quick and others¹⁰ developed a simple procedure for determining prothrombin in blood, dependent on the observation that the clotting time of oxalated plasma when the plasma is mixed with an excess of thromboplastin and an excess of calcium can be employed as a direct measure of the prothrombin content of plasma. In other words, with thromboplastin and calcium constant the rate of coagulation is dependent on the concentration of prothrombin and serves as a simple and direct means for determining this important clotting factor in blood.

PROCEDURE

All blood was obtained from veins, the superior longitudinal sinus in the infants and the antecubital vein in the mothers being used. In a small test tube 1.8 cc. of blood was mixed with 0.2 cc. of 0.1 mol sodium oxalate solution and centrifuged. Then 0.1 cc. of plasma was mixed with 0.1 cc. of thromboplastin, the tube being agitated in a water bath at a constant temperature of 37.5 C. Next was added 0.1 cc. of 0.025 mol calcium chloride solution. The time from the addition of the calcium to the formation of a clot was recorded with a stopwatch. The time in seconds consumed to form the clot was recorded as the prothrombin time. A thromboplastin preparation giving a normal

time of fifteen seconds with variations of two seconds either way was used.

Throughout this paper we shall speak in terms of prothrombin "time" rather than of prothrombin "level" or "concentration." It should be pointed out that a high

Chart 1.—Comparison of the average prothrombin times of 50 infants treated prophylactically with a vitamin K preparation before delivery and 50 control infants.

prothrombin time denotes a lowered prothrombin level and that a low prothrombin time indicates a high prothrombin level.

In this report 100 mothers and 100 infants were studied. Fifty of each were used as controls, and 50 were treated intravenously with 1 mg. of the vitamin K preparation, the patients being alternated as nearly as possible. The mother's prothrombin time was determined before the vitamin K preparation was given and again before and after delivery. Except in a few instances the infant's prothrombin time was taken from the cord blood at birth, and on the second, third, fourth, sixth and eighth days, from blood obtained from the superior longitudinal sinus. While we have obtained infants' blood by more than five hundred fontanel punctures without harm, the method has too many technical difficulties to recommend its routine use. The various cutaneous puncture tests have much to recommend them. The prothrombin readings were made by the Quick method.¹⁰ At least two readings were made on each specimen. The results were considered accurate when the readings on any one specimen of plasma checked within one and one-half seconds. The average of these readings is recorded in our tables.

RESULTS

There was a definite rise in the prothrombin time of infants whose mothers did not receive the vitamin K preparation before delivery. The average rise during the first four days was forty and sixty-two hundredths seconds. The greatest rise in any one case was two hundred and ninety-nine and seven-tenths seconds. Thirty-eight per cent of the infants had their highest prothrombin time on the third day, while 58 per cent had their highest time on the fourth day. After this rise there was usually a rapid drop to near normal levels on the sixth to the eighth day. In chart 1 the dotted line represents the curve of the prothrombin time of

the infants whose mothers did not receive the vitamin K preparation.

The solid line in chart 1 represents the average prothrombin times of the infants whose mothers received the vitamin K preparation before delivery. The average rise above the level at birth was one and eighty-eight hundredths seconds, the greatest rise in any one case nine seconds, and in many cases there was no rise at all. This graphically represents how definitely the prothrombin times were controlled by the antepartum use of the vitamin K preparation. To our knowledge, this is the first time that prothrombin deficiency in newborn infants has been prevented by the intravenous use of the vitamin K preparation administered to the mother before delivery.

With rare exceptions, newborn infants normally show this decided rise in prothrombin time during the first week of life. We encountered 5 infants (10 per cent) from the control series who did not show the usual rise in prothrombin time that was observed in the remainder of the control series. We have been unable to find an adequate explanation for these results.

We arbitrarily divided the treated mothers into two groups: 27 mothers received the vitamin K preparation two hours or less before the time of delivery, and 23 mothers received the vitamin two or more hours before delivery. This was done to learn whether the time of administration of the vitamin K preparation before delivery had any effect on the prothrombin time during the first week of the infant's life. Chart 2 shows that there was no appreciable difference in the prothrombin times in the two groups. In the first group 19 mothers received the vitamin less than thirty minutes before delivery, 2 of them receiving injections five minutes before and 3 between five and ten minutes before. The longest time between treatment and delivery was twenty-three hours and fifteen minutes. In no case did the infant fail to respond.

Chart 2.—Comparison of the average prothrombin times of 27 infants whose mothers were treated less than two hours before delivery and 23 infants whose mothers were treated more than two hours before delivery.

Six infants (12 per cent) in our control series had prothrombin times above ninety-five seconds. Of these only 1 had a normal cord prothrombin time. Another infant, not used in the series because of treatment with vitamin K, had an unusually high cord prothrombin time, and later hemorrhagic disease of the newborn

developed with a prothrombin time of five hundred and seventy-one and five-tenths seconds.

In the series of infants treated prophylactically 10 (20 per cent) had cord prothrombin times above twenty seconds. In 8 of these there was no subsequent rise, while 2 of them showed a slight rise.

The infant's prothrombin time may be markedly elevated and still the infant may not show signs of

hemorrhage. One of our control infants had a prothrombin time of three hundred and fourteen and seven-tenths seconds yet showed no sign of hemorrhage; but the time returned spontaneously to the level at birth.

Six infants, 5 of them not used in this series, were treated with the vitamin K preparation either because of bleeding or because of a high prothrombin time. In all but 1 the response was dramatic. The prothrombin time of 1 infant with hematemesis dropped from five hundred and seventy-one and five-tenths seconds to seventeen and four-tenths seconds in four and one-half hours. One of the 5 infants had lost a large amount of blood before vitamin K was given. This infant died about five hours after treatment with an even higher prothrombin time. All these patients received the same dose (1 mg.) of the vitamin K preparation intravenously.

The prothrombin times of the mother and of the infant at birth are shown in table 1. The maternal prothrombin time averaged two and seventeen-hundredths seconds less than that of the infants. These results agree with the observations of Quick and Grossman¹¹ and of Waddell and Guerry⁷ but appear to disagree with those of Kato and Poncher.¹² This discrepancy may perhaps be explained by difference in technic and time of obtaining blood.

The antepartum use of this vitamin K preparation had no toxic effects on the infants as far as the temperatures or weight curves were concerned. A single temperature reading of 100 F. (37.5 C.) or more was arbitrarily considered abnormal. On this basis, 18 per cent of the control infants had a temperature of 100 F. (37.5 C.) or more and 18 per cent of the treated infants had a similar rise in temperature. Both the control infants and the treated infants were cared for in the nursery under identical conditions.

Table 2 shows that in both the control group and the treated group of mothers the prothrombin times

were similar and showed no change of any consequence. All maternal prothrombin times were normal and showed slight response to the administration of the vitamin K preparation.

COMMENT

In this study we have presented evidence that the prothrombin time of the newborn infant can be lowered by the intravenous administration of vitamin K preparation to the mother before delivery. The average newborn infant has a higher prothrombin time than the mother, as the infant possesses a smaller fraction of prothrombin complement than the adult. Certain infants have a tendency to bleed under the stimulus of moderate trauma. Unusually high prothrombin times may well account for such unnatural tendencies to bleeding. Vitamin K preparation administered intravenously to the mother before delivery effectively prevents prothrombin deficiency in the newborn infant and probably serves to check such bleeding and render harmless a slow, oozing hemorrhage.

Our study also shows that irrespective of the time that the vitamin K preparation was administered to the mothers by the intravenous route, whether five minutes or twenty-four hours before delivery, the infants' cord prothrombin times were practically identical. The same may be said of the prothrombin times in the two groups of infants during the first eight days of life. This seems to indicate clearly that the placenta offers no barrier to the passage of the vitamin K preparation. It should be recalled that the molecule of this vitamin K preparation is relatively small and, according to Needham,¹³ small molecules pass through the placenta easily, larger molecules less easily and still larger molecules not at all.

Because vitamin K is so effective in small doses (1 cc. ampule) and is easily administered intravenously to the infant by way of the maternal blood stream and because it is apparently nontoxic, we believe that this vitamin should be used prophylactically in all labors, even though there is no opportunity to give the vitamin until late in labor.

It seems likely that a high prothrombin time (low prothrombin concentration) is an important factor in cases of neonatal cerebral hemorrhage. In these cases this vitamin K preparation offers a rational way of preventing bleeding. Because cord prothrombin times are normal or near normal, vitamin K preparation cannot be expected to have much effect on the hemorrhage occurring at the time of delivery but should definitely decrease the amount of hemorrhage that may occur eight or more hours after delivery during the period of prothrombin deficiency.

In 1920 Rodda¹⁴ reported that postmortem examinations revealed cerebral hemorrhages in more than 50 per cent of all infants who died intra partum or during the first few days of life. It was notable that these observations often were made after noninstrumental or even easy delivery. They were especially frequent after breech presentations and in premature births. Rodda pointed out that what had not been realized sufficiently in the past was the extent of hemorrhagic disease in the newborn represented by delayed coagulation time and prolonged bleeding time and that cerebral hemorrhage is not always caused by obstetric operations. In such

cases Rodda advocated the subcutaneous injection of whole blood to lessen the cerebral hemorrhages. This type of therapy has been used advantageously up to the present time, but it is our opinion that this vitamin K preparation is a more effective mode of treatment or prophylactic measure to employ.

When vitamin K preparation is used prophylactically it should be given to the mother as early in labor as possible, and if the labor is prolonged more than twenty-four hours it might well be repeated. If the patient presents herself late in labor, the vitamin K preparation may still be given advantageously, even as late as five minutes before delivery. This vitamin K preparation is especially indicated whenever the infant is likely to be premature, if the labor is prolonged or if operative delivery of any type is anticipated.

Used in treatment this vitamin K preparation should be given with the first sign of hemorrhage or with evidence of a decided drop in the prothrombin level. The prothrombin level, and not jaundice, is the indication of the bleeding tendency.¹⁵ If the loss of blood has been severe administration of vitamin K preparation should be supplemented with a transfusion. Apparently patients with more serious hemorrhages require more than vitamin K.

CONCLUSIONS

1. With rare exceptions newborn infants normally show a considerable rise in prothrombin time during the first week of life.

2. A vitamin K preparation (4-amino-2 methyl-1-naphthol hydrochloride) given intravenously to the mother before delivery effectively prevents prothrombin deficiency in the newborn and therefore may logically be expected to prevent hemorrhagic disease of newborn infants.

3. The time of administration of the vitamin K preparation makes no apparent difference in the results obtained, as vitamin K effectively controls the prothrombin level of newborn infants during the first week, regardless of the time of administration to the mother before delivery.

4. The infants' cord prothrombin time averages slightly more than two seconds higher than the maternal prothrombin time.

5. The vitamin K preparation has no gross toxic effects on the baby during the first week of life.

6. Labor has no effect on the mother's prothrombin time, even though this vitamin K preparation is not given.

7. Vitamin K probably has no effect on the hemorrhage occurring at the time of delivery but should definitely decrease the amount of hemorrhage that may occur eight hours or more after delivery.

8. There is evidence that this vitamin K preparation readily passes through the placenta.

9. Vitamin K preparation used in treatment effectively and rapidly reduces the prothrombin time.

10. Because it is so effective in small doses and is easily administered intravenously to the infant by way of the maternal blood stream, and because it is not toxic, this vitamin K preparation can be given routinely as a prophylactic measure. It should always be given (1) when the infant is likely to be premature, (2) if labor is prolonged and (3) if operative delivery of any type is anticipated.

AERO-OTITIS MEDIA IN COMPRESSED AIR WORKERS

TREATMENT WITH HELIUM-OXYGEN MIXTURES

WILLIAM H. REQUARTH, M.D.

CHICAGO

Armstrong and Heim¹ in 1937 described a disorder of the middle ear caused by changes in atmospheric pressure during flight and subscribed the name "aero-otitis media" to it. This clinical entity, which is the result of blockage of the eustachian tube under changing atmospheric pressure, gradually has assumed an important position in the list of occupational diseases among pilots and other flying personnel. It is not limited to aviation medicine, however, and, as previously pointed out,² the significance of aero-otitis media is even greater in industrial groups because of its high frequency in workers in compressed air. The fluctuation of atmospheric pressure is greater in work done in compressed air, and a significant number of patients progress to suppurative otitis media with permanent impairment of hearing. Tubal blockage or impaired ventilation of the middle ear by the eustachian tube is the primary factor involved. Lovelace, Mayo and Boothby³ expressed the belief that helium-oxygen mixtures might be useful in relieving this impairment. Helium, with a molecular weight of 4, is the lightest of all elements and has a rate of diffusion two and seven-tenths times that of nitrogen. They reasoned that in a mixture of helium and oxygen the helium would diffuse more rapidly through the eustachian tube. They subsequently employed the gas in a series of cases the results of which indicated that it definitely helped relieve tubal blockage.

This work stimulated me to investigate its efficacy in the aero-otitis media of workers in compressed air. The extensive tunneling operations under increased atmospheric pressure in the construction of the Chicago subway system afforded an excellent opportunity to study a large series of cases. My purpose in this paper is to review the syndrome of aero-otitis media among workers in compressed air and to outline my regimen of treatment of 400 men. The series has been divided into two groups of 200 consecutive workers each. In one helium was not used, and in the other helium-oxygen mixtures were employed as a method of treatment. The results in each group are tabulated and compared.

Aero-otitis media is an acute or chronic disease of the middle ear caused by occlusion of the eustachian tube in the presence of a changing atmospheric pressure. Pathologically it is characterized by deformity and hyperemia of the tympanic membrane and serous or sanguineous exudate in the middle ear and clinically by tinnitus, pain in the ear and impairment of hearing. Its most frequent complication is perforation of the

Mr. Albert E. McKee of the Oxygen Equipment and Service Company, 423 South Honore Street, Chicago, constructed the apparatus for administering helium-oxygen mixtures under pressure.

drum with subsequent suppuration and occasional permanent auditory impairment.

ANATOMY AND PATHOLOGIC PHYSIOLOGY

The middle ear is a closed cavity whose only means of ventilation is the eustachian tube. This structure is approximately 36 mm. in length; normally its lumen is obliterated by apposition of the walls of the tube. It may be opened by contraction of dilator muscles during yawning and swallowing. Patency of the tube assures equalization of any differences in pressure which may exist between the middle ear and the nasopharynx. The tympanic membrane being the only wall of the middle ear which is not fixed, any difference in pressure immediately is manifested by retraction or bulging of the membrane. This deformity, which may result after a change in pressure of as little as 3 to 5 mm. of mercury,¹ causes first a feeling of pressure in the ears, then impairment of hearing. As the discrepancy in pressure increases, severe pain is experienced, the ear drum is forced inward, and a relative negative pressure exists in the middle ear. With increase in the environmental pressure the relative negative pressure increases in the middle ear with subsequent swelling of the lining mucosa and outpouring of exudative fluid. A small vessel occasionally may rupture and fill the space with blood, which drains through the tube into the pharynx. It is not unusual for tunnel workers to endure, momen-

Fig. 1.—Apparatus designed for the administration of helium and oxygen mixtures under a constant positive pressure, consisting of a mask, breathing tube, spirometric breathing bag, calibrated type spill valve and weights for producing pressure in the system.

tarily, pressures of 12 to 15 pounds (5.4 to 6.8 Kg.) without clearing their ears. The pain is severe, but I have never seen a ruptured drum, although the middle ear under such circumstances invariably is filled with bloody fluid.

ETIOLOGY

The most important predisposing factor of blockage in my experience is an infection of the upper part of the respiratory tract. Of the workers observed, 96 per cent suffered with the common cold, sinusitis or pharyn-

Fig. 2.—Apparatus in use.

gitis. The tubal blockage subsided with the infection of the upper part of the respiratory tract. Chronically diseased tonsils, carious teeth, sinusitis and similar diseases of the nose, mouth and throat are important causative factors. Anatomically, the eustachian tube is especially vulnerable, as the mucous membrane of the pharynx lines the tube and even continues into the middle ear itself. Infections readily are carried into the tube; the walls become edematous and the lumen is closed. In like manner, infection of the adenoid tissue about the pharyngeal ostium, called Gerlach's tonsil, aids closure at this point. Other etiologic factors listed by Armstrong and Heim¹ include nasal obstructions, tumors and growths of the nose and nasopharynx, paralysis of the soft palate or superior pharyngeal muscles and scar tissue about the ostium of the tube after adenoidectomy. Costen⁴ and later Willhelmy⁵ demonstrated that any factor which shortens the vertical position of the lower jaw, such as absence of teeth, poorly fitting dental plates or considerable overbite, causes a stenosis of the tube due to relaxation of the surrounding soft tissue.

Workmen in compressed air are particularly predisposed to disorders of the upper part of the respiratory tract. This can be logically explained. Air under pressure has a higher temperature due directly to the mechanics of compression. The collecting chambers on

4. Costen, J. B.: A Syndrome of Ear and Sinus Symptoms Dependent upon Disturbed Function of the Temporomandibular Joint, *Ann. Otol., Rhin. & Laryng.* 43: 1-15 (March) 1934.

the surface, used for storage, frequently are exposed to sunlight, which further raises the temperature. Daily temperatures recorded in the headings of tunnels often reach 86 F. (30 C.). As the pressure is released, the air vaporizes and the temperature drops. The workman

TABLE 1.—Comparison of Time Lost from Work, Infection and Suppuration in Treated and Untreated Workers

	Cases	Upper Respiratory Infection Present	Lost Time from Work	Suppuration
Series 1: no helium.....	200	191 95.5%	90 45.0%	9 4.5%
Series 2: helium.....	200	191 95.5%	67 33.5%	3 1.5%

thus suddenly is transferred from a warm environment to the cold damp conditions of the lock.

SYMPTOMS

The onset of the ailment is associated with the initial increase in atmospheric pressure as the workman enters the lock. Symptoms range from slight impairment of hearing and feeling of pressure in the ear to decided auditory impairment, tinnitus and severe auricular pain. The patient often expectorates small quantities of bright red blood; occasionally there is hemorrhage from the external ear. Examination in the ordinary case of mild aero-otitis media reveals a retracted tympanic membrane which may have a typical dusky red hyperemia. A small amount of fluid may be seen in the middle ear. In cases of more severe otitis the middle ear is filled with serosanguineous fluid, the drum is a dark bluish red and there is a middle-ear type of deafness. The less severe disorders subside in twenty-four to forty-eight hours, the drum resumes its normal appearance and the hearing is unimpaired. Aero-otitis media associated with much fluid in the middle ear resolves slowly over a period of several days to several weeks. Hearing returns as the fluid resolves. In a significant number of patients the fluid becomes infected, perforation occurs and typical suppurative otitis media results. This is the only complication of aero-otitis media in tunnel workers and, as its sequel, may produce permanent auditory impairment.

TREATMENT

In the prophylactic treatment of aero-otitis media, preemployment physical examinations assume an important role. Persons predisposed to infections of the

TABLE 2.—Clinical Results in Workers Treated with Helium

	No Relief or Results Questionable	Moderate Relief	Complete Relief
Number of cases.....	52	38	110
Percentage of total.....	26	19	55

upper part of the respiratory tract should be eliminated by careful examination. As prophylaxis, the following regimen is recommended:

1. A general physical examination before employment, certain factors being emphasized:

(a) Careful questioning with respect to previous experience in compressed air and history of a recently discharging ear or sinusitis.

(b) A critical examination of the nose and throat for evidence of pharyngitis, sinusitis, nasal polyposis or extremely carious teeth accompanied by low grade gingivitis.

(c) Elimination of important predisposing factors, such as badly fitting dental plates, lack of molar teeth and other causes of improper dental occlusion which allow overclosure of the mandible.

(d) Careful inspection of the ear drums for scarring, infections and evidence of old perforations. It has been my experience that unhealed perforations which are not infected may be passed.

(e) An accurate measure of the hearing as a safeguard to the workman and to the employer. The use of the audiometer is recommended.⁶

2. The daily elimination of workers suffering with colds and sore throats, although ideal from the standpoint of prevention, is practical only in small scale construction operations.

3. Much can be accomplished by adequate instruction of employees regarding prevention. This should include a demonstration of the Valsalva inflation of the ear. Lock tenders should stop after every 2 to 3 pounds (0.9 to 1.3 Kg.) increase in pressure and ascertain whether all workers have opened their ears. Those who have failed to should be referred to the physician for treat-

TABLE 3.—Condition of Tympanic Membrane in Workers Treated with Helium

	Number Observed	Normal	Slightly Infected	Deeply Infected	Fluid or Perforation
Number of cases.....	239	76	109	25	26
Percentage of total.....		32.2	46.0	10.5	11.0

ment. This is important, as many men otherwise will remain in the lock and attempt to open their ears by vigorous inflation. It has been shown¹ that after a negative pressure of 90 mm. of mercury has developed in the middle ear it is impossible for the tube to open. An extravasation of fluid and blood, in the meantime, fills the middle ear.

Actively, treatment is directed toward equalization of the pressure in the middle ear by reestablishing patency of the eustachian tube. The nose is sprayed thoroughly with a 2 per cent solution of ephedrine sulfate in physiologic solution of sodium chloride preparatory to the administration of helium.

HELIUM

The gas is given in a mixture consisting of eighty parts of helium and twenty parts of oxygen. I originally employed the Boothby mask as advocated by Lovelace.³ This was satisfactory in most instances, but in more resistant aero-otitis media the use of the Politzer bag immediately after treatment often relieved the block. It occurred to me that if the gas were breathed under positive pressure a greater number of satisfactory results would be obtained. Consequently an apparatus, mounted in a case to facilitate transportation, was designed for the breathing of mixtures of helium and oxygen under a constant positive pressure (fig. 1). It consists essentially of a mask, a breathing tube, a spirometric breathing bag, a calibrated spill valve of the

6. Hayden, A. A.: Audiometers and Hearing Aids, J. A. M. A. 110: 723-725 (March 5) 1938.

gravity type and weights for producing pressure in the system. The positive pressure can be regulated from 6 mm. to 32 mm. of mercury. The average patient obtains relief in four minutes at a rate of flow of 8 liters a minute and a pressure of 12 mm. of mercury. Patients with more obstinate aero-otitis media may require ten minutes. My experience, however, indicates that longer treatment is useless. Treatments are begun immediately after the patient leaves the lock. Although helium would seem more effective if administered during the change in pressure, extensive experiments in the lock itself did not support this belief. The cost per treatment is approximately 30 cents.

Of the 400 tunnel workers with aero-otitis media whose cases I recorded 200 consecutive workers were treated in the conventional manner as controls and 200 with helium-oxygen mixtures. The records as regards time lost from work, suppurative otitis media and presence of infection of the upper part of the respiratory tract are presented in table 1. Table 2 shows the results obtained with helium as indicated by relief of tubal blockage. The condition of the tympanic membrane in this series is recorded in table 3. Drums which showed little change from normal were recorded as "slightly injected"; those with extensive injection and hyperemia were recorded as "deeply injected." Evidence of gross fluid or post-tympanic hemorrhage also was recorded.

COMMENT

Several interesting observations can be made from these data. The high percentage of infections of the upper part of the respiratory tract emphasizes the common cold as a causative factor. The fact that in 3 to 4.5 per cent of the cases no history or clinical evidence of infection was available does not necessarily mean that there was none; judging from the high percentage which did present this evidence, a subclinical infection probably did exist. Patients treated with helium lost fewer days from work. Most important from the industrial point of view is the decrease in suppurative otitis media from 4.5 per cent in series 1 to 1.5 per cent in series 2.

More than one half of the series were relieved completely, and 74 per cent were benefited by helium-oxygen mixtures. An analysis of the causes of failure in 26 per cent revealed that 23 per cent of the ear drums in this group showed perforation, gross fluid or extensive changes. In the latter group, patients classified as "deeply injected" probably had some exudative fluid in the ear not determined by ordinary examination. I believe that helium is of no value when the middle ear is filled with blood or fluid. The 74 per cent who were relieved correspond roughly with the 78.2 per cent who had either normal or slightly abnormal drums.

Comparison of these two series demonstrated the efficacy of helium-oxygen mixtures in the treatment of aero-otitis media. The efficacy of the gas is limited to patients in whom there is little or no change in the tympanic membrane and the middle ear contains little or no fluid. In the presence of hemorrhage or large amounts of fluid, no response is obtained.

SUMMARY AND CONCLUSIONS

1. A regimen of prophylactic and active treatment using helium-oxygen mixtures was developed for the syndrome of aero-otitis media in tunnel workers.

2. For obtaining a comparison of the results of treatment with and without the use of helium, the workers were divided into two series, each of which consisted of 200 patients.

3. In the helium series, only 33.5 per cent of the patients lost time from work and 1.5 per cent progressed to suppuration, as compared to 45 per cent who lost time and 4.5 per cent who had suppuration in the series of controls.

4. Helium-oxygen mixtures afforded complete relief of tubal blockage in 55 per cent and moderate relief in 19 per cent of the patients. The 26 per cent of failures corresponds roughly to the number of ear drums which showed evidence of perforation, gross fluid in the middle ear or extensive changes in the drum itself.

5. The efficacy of the gas is limited to patients with little or no change in the tympanic membrane and little or no fluid in the middle ear.

Clinical Notes, Suggestions and New Instruments

MASS TESTING OF COLOR VISION

ERICH SACHS, M.D., DETROIT

Routine examinations of the sense of color are becoming increasingly important both in connection with occupation in peaceful pursuits and in relation to the national defense. As often as not, a test of color vision must be made when a large number of examinees is present. Any reliable method of testing a sizable group at one time will confer an obvious boon and will naturally be applicable in situations in which a color vision test, though desirable, has not customarily been given because of lack of time or of sufficient examiners.

An exact diagnosis of a given deficiency in color vision can be made only with a Nagel anomaloscope in the hands of an expert. But for practical purposes it usually suffices to be able to say "deviation from normal trichromatic vision—unfit for special service." Such a diagnosis can be made simply and with a minimum of error with Stilling or Ishihara charts. Used according to directions, these will disclose any important deviation. Errors are likely to be made in the direction of safety, an occasional "normal" person being rejected as "abnormal."

Berens and Stein¹ recently described a method for group testing, employing Kodachrome lantern slides of standard charts (Ishihara, Stilling) projected on a beaded screen in a dim (not dark) room, enabling the observers to make pencil notes of the characters they can decipher. This ingenious method is likely to be widely adopted, but it contains certain pitfalls which need pointing out if serious failures are not to endanger its repute.

The aforementioned charts depend on the principle that if the brightness and saturation (coloredness) of two differently colored stimuli are equated, the stimuli will look alike to any one who cannot distinguish their colors (hues) as such. Since exact matches of saturation and brightness would be difficult and expensive to reproduce on paper and would have to be used under a particular and critical illumination, each chart simply presents a numeral composed of colored dots of various degrees of brightness and saturation at random, on a background of other, differently colored dots having the same range of brightness and saturation. There is thus no demarcation of the numeral from its background in any quality except hue.

1. Berens, Conrad, and Stein, Lester: Group Color Vision Tests, *J. A. M. A.* 113:1563-1564 (Oct. 21) 1939.

The appearance of any object depends, however, on the kind of illumination and on the adaptation of the observer. A red and a green indistinguishable under white light by a person with a deficiency in color perception will be made easily discriminable by him if the colors are illuminated by an off-white light which is reflected more from one of the objects than from the other. Then, too, any approach toward dark adaptation will create a difference between the "identical" red and green through the medium of the well known Purkinje phenomenon: the red will become relatively less bright and the green relatively brighter as dark adaptation supervenes.

The Ishihara and Stilling charts are intended to be used in daylight, at a distance of 30 inches and with thoroughly light-adapted subjects. Any artificial illumination introduces the danger that it may not be perfectly neutral (i. e., white), and if it is not intense the subjects may partially dark-adapt. It is clear that any mass test with projected charts should be made with an arc or blue mazda projection illuminant in a daylight-lit room and with a "daylight" screen. Otherwise, actually defective persons will be able to read numerals which, for them, should blend with the spotted background.

Even with this source of failure eliminated there remains another, related to the size of the projected images. An examiner will naturally be tempted to crowd as many subjects into the room as possible, the crowding resulting in great individual differences in distance from the screen and consequent differences in size of the retinal image. Berens and Stein have made the point that the visual acuity of the subjects need not be normal, since the screen images are so large; but if the group includes persons with uncorrected refractive errors this will be equivalent to having such persons hold the actual charts at a distance other than the prescribed 30 inches.

Enlarging the charts out of proportion to their angular size at 30 inches will do no harm if the subject is known in advance to be normal, but obviously he is not. The harm is potential with a certain large class of persons with defective color vision, who far outnumber those with hereditary color-blindness, i. e., the "anomalous trichromats." Many of these persons can identify color stimuli accurately if they are presented over a sufficient period of time or over a sufficiently large area. But they cannot tell the color of a short flash such as is given by a naval Ardois signal, and they must be closer (than the normal person) to a steady light, such as a railroad beacon, so that it may subtend a sufficient visual angle.

Persons with such deficiencies should certainly not be allowed to slip past military, naval and railroad examinations. But if projected Ishihara tests are enlarged too greatly, obviously many anomalous trichromats will pass them, later to become sources of grave danger to their fellow-men if allowed into critical services. It therefore needs to be urged that users of the Berens-Stein method avoid testing groups so large that any person has to be seated close to the screen or so large that the images have to be made enormous for the benefit of those in the back rows. It will probably be found impractical to expose the slides for short enough periods to detect anomalous trichromats through their temporal peculiarity—too many of the mentally sluggish normal examinees will complain that they are being hurried. There is all the more reason, therefore, for avoiding any artificial aid to anomalous trichromats in the form of a huge retinal image.

CONCLUSIONS

The Berens-Stein method of mass testing for deficiencies in color vision will yield the most dependable results if (a) the images of the charts are projected with a pure white light, (b) the room is illuminated by sunlight, and brightly enough to maintain light adaptation, with a "daylight" screen employed, (c) the group is small enough so that no person is too close to or distant from the screen and (d) the magnification of the screen images equals the quotient of the observer-screen distance divided by 30 inches.

Ophthalmic Research Laboratory, Wayne University College of Medicine.

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING CHAPTER, WHICH IS THE FIFTH OF A SERIES ON AMPUTATIONS AND ARTIFICIAL LIMBS TO APPEAR IN THIS COLUMN. WHEN COMPLETED, THE SERIES WILL BE PUBLISHED IN THE FORM OF A HANDBOOK ON AMPUTATIONS. THE COUNCIL WISHES TO EXPRESS ITS APPRECIATION FOR THE COOPERATION OF ITS GROUP OF CONSULTANTS ON ARTIFICIAL LIMBS. THE COUNCIL IS REPRESENTED BY DR. FRANK D. DICKSON, HARRY E. MOCK, FRANK R. OBER, S. PERRY ROGERS, PAUL STEELE AND PHILIP WILSON, AND THE ASSOCIATION OF LIMB MANUFACTURERS OF AMERICA IS REPRESENTED BY MESSRS. MCCARTHY HANGER SR., W. E. ISLE, JOSEPH A. SPIEVAK, DAVID E. STOLPE AND J. B. KORRADY.

HOWARD A. CARTER, Secretary.

CHAPTER VII. INTERRELATIONSHIPS OF THE ARTIFICIAL LIMB MANUFACTURER, THE SURGEON AND THE PATIENT

THE NEED FOR CLOSER COOPERATION

The successful rehabilitation of the patient should be uppermost in the minds of both the surgeon and the artificial limb manufacturer. Only by the closest cooperation between them can the best results be obtained. The surgeon should not feel that it is any reflection on his ability to confer and advise with the artificial limb manufacturer. The artificial limb manufacturer should willingly give of his time and experiences in such a conference. After all, both are specialists in their fields and the two are striving for the same best results. There should therefore be no overlapping of authority or any hesitancy on the part of either so to cooperate.

The surgeon should understand that the question of materials is relatively unimportant. The greater number of manufacturers use either willow or basswood in their limb construction. Some manufacturers, however, prefer metal or fiber, depending somewhat on the conditions around which each individual business has been built. Metal is exclusively used in the manufacture of the various types of joints employed in artificial limb construction. The principal requirement as far as materials are concerned is that they should be first class in every particular. The interest of the surgeon in this respect should be centered on knowing that only first class materials are being used by experienced manufacturers.

The surgeon need not have an intimate knowledge of the details of materials and construction of artificial limbs. He should be capable of some judgment on the various types of artificial feet and he should be familiar with the standard types of knee joints, hip joints and joint control mechanisms, but he should avoid fixed ideas on technical details which are primarily the concern of the limb manufacturer. He should know enough about methods of fitting appliances to realize the advantages of a personal fitting at the factory where the limb is being constructed rather than requiring the manufacturer to work from drawings and casts. Without himself qualifying as a leg maker he should appreciate that one or more such personal fittings are usually worth much in comfort and satisfaction to the patient.

The surgeon in his effort to rehabilitate his patient to the greatest possible extent should acquaint himself with the various artificial limb manufacturers doing business in his immediate territory. He should give careful consideration to the character of each company, to its financial integrity and to its reputation for dealing fairly with its customers. As the most important consideration of all he should ascertain the ability of its fitters to produce a socket which will fit comfortably

and to set up an appliance in proper balance and alignment. Such information can be obtained most readily by calling on the manufacturers and by interviewing patients and acquaintances wearing artificial limbs.

THE ETHICAL RELATIONSHIPS OF THE LIMB MANUFACTURERS

The Association of Limb Manufacturers of America has adopted a Code of Ethics which must be subscribed to by every member of that organization. Seven articles of that code deal with the manufacturer's relationships with the surgeon and the patient, as follows:

CODE OF ETHICS

ARTICLE 1.—It is forbidden to credit or agree to credit the payment of a deposit already made to another manufacturer on the price of a limb, or to cause a person who has already placed a bona fide order for an artificial limb with another manufacturer to cancel such order; provided that, if any manufacturer is unable or unwilling within ninety days to produce the limb ordered by the customer, such customer may place, and a member may receive, an order for a limb, notice being duly given to the first manufacturer of the intended action.

ARTICLE 2.—It is forbidden to make untruthful or derogatory statements about a competitor, his product, his character, his associates or his employees, or to make untruthful statements about his financial standing. It is forbidden to exhibit, or cause to be exhibited, samples or alleged samples of a competitor's products for derogatory purposes.

ARTICLE 3.—It is forbidden to make or publish or cause to be made or published, directly or indirectly, any false, misleading or deceptive statements or representation by way of verbal statements, depictions, advertising or otherwise, concerning the grade, material, construction, operation, use or durability of any products of the industry, or in any other material respect.

ARTICLE 4.—Demonstration of a member's products in a manner calculated to mislead or deceive the prospect is prohibited.

ARTICLE 5.—It is forbidden for a member of the industry securing orders through agents or other representatives furnished with samples, literature and guaranties by such members, subsequently, to refuse to carry out the terms, conditions and guaranties made by such agent or representative.

ARTICLE 6.—It is forbidden, directly or indirectly, to interfere with or entice an employee to leave the employ of any other member of this association or to refuse to help a member of this association to acquire and maintain the services of competent workmen.

ARTICLE 7.—It is forbidden to use membership in this association for the purpose of advancing one's own business interests to the injury or detriment of any other member, or to solicit orders by making promises impossible or uncertain of fulfillment.

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION
OF THE FOLLOWING REPORTS.

HOWARD A. CARTER, Secretary.

BRAM-MASSEUR NOT ACCEPTABLE

Manufacturer: Brammer Manufacturing Company, 1441-1501 Rockingham Road, Davenport, Iowa.

In a communication to the Council from the manufacturer of the Bram-Masseur it is stated that ". . . the Bram-Masseur is the *only true whirlpool bath water massage* for sale in the United States today. . . . It is, indeed, a true whirlpool bath of an efficiency in hitherto unattainable by any device on the market and uniquely in a class by itself."

The Council investigated the apparatus clinically and it was found that the Bram-Masseur has a small tank (14.5 by 12.5 by 7 inches) with a capacity of 3½ gallons of water. At the bottom of one end of the tank is a motor-driven disk with smooth elevations. In operation, this disk revolves rapidly and churns the water in a manner somewhat similar to that of a disk in a washing machine.

The tank is too small for the feet to be submerged in it unless they touch the revolving disk, and also too small for the forearm to be immersed up to the elbow. When the apparatus is in operation, the elevated areas of the revolving disk pound the foot or the hand in the water; this action is much too rigorous unless the member being treated is practically normal. The use of the device in the treatment of painful hands or feet would be out of the question if the vibrator was permitted to hit them.

In the advertising matter, statements are made to the effect that this apparatus obtains in ten minutes results at least comparable to manual massage for thirty minutes. There is no critical evidence to substantiate this statement. Included in the advertising is a long list of indications, in many of which it would be undesirable to use such an apparatus.

In the mimeographed sheet called "Salesman's Non-Technical Sales Talk on Uses of Bram Masseur," such statements are made as "Relieve certain types of headache and backache. . . . Women under emotional strain or overwork, fatigue, find immediate relief that lasts for an hour or more enabling them to get their bodily strength back, ease their nerves and aches, and actually 'puts them on their feet again.'" In the opinion of the Council, these statements have not been substantiated by critical evidence.

The Council voted not to include the Bram-Masseur in its list of accepted devices because (1) evidence of a critical nature has not been made available to substantiate its efficacy and (2) exaggerated and unwarranted statements are made in the advertising.

DR. SHRADER'S EAR PUMP NOT ACCEPTABLE

Manufacturer: T. B. Shrader Ear Pump, Syracuse and Lincoln, Neb.

Dr. Shrader's Ear Pump, advocated by the manufacturer for use by deafened persons, consists of a rubber cup approximately the shape of a half sphere which is intended to be placed over the ear. Pushing on the knob will cause the rubber cup to collapse, thus creating pressure within its interior and transmitting this pressure to the ear drum. The alternate placing of pressure will therefore move the ear drum back and forth slightly. The many inquiries concerning the device which have come to the office of the Council indicate that it is being actively promoted. In the opinion of the Council, it was considered advisable to investigate this device, report on it and make this information available to the profession.

This apparatus is advertised and sold by T. B. Shrader, Syracuse and Lincoln, Neb., who is apparently a chiropractor. Such claims as the following are made in the advertising: "Dr. Shrader's Ear Pump restored or improved hearing when other methods failed. Wonderful results obtained in treatment of head noises, ear ache, dry ears." Another statement reads "If you are afflicted with any of these common ear ailments, why continue to suffer when improvement could be made so readily and so simply?"

The device, which looks very much like the rubber end of the sort of plunger pump used to clean out plugged toilets and sinks, was investigated clinically by the Council, and it was found that "Dr. Shrader's Ear Pump" for the treatment of deafness may be a dangerous device when used by an inexperienced layman. The positive and negative pressure which the device is capable of exerting is sufficient in certain conditions, such as an atrophic tympani, to cause a rupture of that membrane.

Pneumomassage of the middle ear by alternate compression and rarefaction of the air in the external canal has long been practiced by otologists. In otosclerosis this procedure is considered to be futile, as it is in nerve deafness. In the opinion of most otologists it is of doubtful value in chronic adhesive, nonsuppurative types of otitis media. Although a competent otologist may at times employ pneumomassage, an inexperienced layman may do serious damage with a device as crude and uncontrollable as the "Dr. Shrader's Ear Pump."

The Council on Physical Therapy voted to declare Dr. Shrader's Ear Pump unacceptable for inclusion on its list of accepted devices.

DURATRON VACUUM TUBE HEARING AID NOT ACCEPTABLE

Manufacturer: C. L. Hofmann Corporation, 436 Boulevard of the Allies, Pittsburgh.

The Duratron Vacuum Tube Hearing Aid has been given consideration by the Council and the investigation revealed that:

The instrument consists of the following parts:

(a) Microphone and amplifier unit B. T. No. 330, enclosed in stamped metal case, 3 by 2 by 1 inches, weighing 94 Gm., fitted with volume and tone control, knurled heads on top of case.

(b) A and B batteries enclosed in a thin cardboard case, 4½ by 2½ by 1 inch, weighing 221 Gm. The A battery is a single 1½ volt cell, current drain 65 milliamperes. The B battery is 30 volts with a current drain of about 0.45 milliamperes.

(c) Crystal receiver ¾ by 1 inch diameter; weighing, with molded earpiece, 7 Gm.

Internal Noise.—The internal noise is not objectionable when the volume control is less than three fourths of full on and the tone control is about one half full on. For higher settings of the controls the instrument is electrically unstable and subject to feedback squeals.

Amplification.—The instrument gives no measurable amplification at 256 and 128 cycles. Measurement of the amplification at higher frequencies gave the following values:

	Amplification				cycles
	512	1,024	2,048	4,000	
Intensity approximately 45 decibels above normal threshold, volume ½, tone ½.....	7	20	23	2	db.
The same, volume ½, tone ¾....	10	22	23	4	db.
Intensity at normal threshold, volume ½, tone ¾.....	18	29	32	25	db.
The same, volume ½, tone ¾....	21	30	35	25	db.

Mechanical Features.—The durability of the sliding connectors may well be questioned, and the instrument might require frequent servicings on this account. There are no markings to indicate the proper connections, and index markings on the controls are lacking.

Advertising Statements.—The only advertising submitted was a small pamphlet of directions, in which the manufacturer makes claims for the "World's Smallest Vacuum Tube Hearing Aid" and sound amplification and "reproducing with absolute fidelity" and "without distortion." The latter statement is doubted, as shown by the fact that the instrument gives no amplification at the lower frequencies. This small booklet is said to be the "Exact size and shape of the New 'Duratron'" and is unacceptable to the Council since it contains many objectionable statements, among which are the following: ". . . tune in clear, natural hearing with DURATRON—the world's smallest vacuum tube hearing aid—and tune out forever harsh, irritating carbon distortion and noise." "DURATRON contains no carbon noise, just clear, natural hearing and true understandability of words, of music; yes, of everything—never before possible with any carbon instrument to this degree." "The pure, natural and life-like reproduction of all sounds gives you a natural, rested and relaxed feeling even after hearing with DURATRON all day. Now, you, too, can enjoy all the wonderful pleasures of hearing and understanding clearly the voices of those about you." It is realized by the Council that the instrument does not use a carbon granule transmitter; nevertheless, the statements are unacceptable because the instrument is still noisy.

The Council on Physical Therapy voted not to include the Duratron Vacuum Tube Hearing Aid on its list of accepted devices because of its objectionable mechanical features and unwarranted advertising claims.

The foregoing report was sent to the C. L. Hofmann Corporation on Aug. 26, 1940. In its reply the firm expressed surprise that the response curves set forth in the Council's report on the instrument were so different from those obtained by the manufacturer before the aid was submitted for consideration by the Council. It was suggested by the firm that the instrument may have been subjected to rough treatment in

transit and damaged; the Council was requested to return the instrument to determine if this had occurred. The Secretary did so, and stated that the report would be held in abeyance for sixty days.

September 3 the firm responded stating that it was interested in submitting a new hearing aid for test and asked for the Council requirements for acceptance of hearing aids. On September 13 acknowledgment of the receipt of the instrument was made by the firm. According to the manufacturer, the crystal receiver had changed in its characteristics and also the crystal microphone element had changed in response so that it was entirely different from that which was standard for the Duratron. The firm asked once more that the report be held in abeyance and renewed its request for requirements. The manufacturer stated "We will be glad to send you a unit for examination and test." On September 18 the Secretary furnished the firm a reprint of the requirements for acceptance of hearing aids (THE JOURNAL, May 11, 1940, p. 1881) with an explanatory note. These explanations in detail may be found in the article by Dr. Paul Sabine in THE JOURNAL, Nov. 9, 1940, page 1633. The reasons the Council did not accept the instrument were also restated in the letter.

In a reply October 2 the firm reiterated that the unit examined by the Council was not comparable to the usual Duratron and "Certainly had been changed in transit or elsewhere before being returned to us." The letter went on to state that the advertising examined by the Council had been used two years before in promoting the first model Duratron and that the other portion of the advertising was used on another model Duratron. According to the firm the only piece that applied to the Model V. T. (the type investigated) was the instruction book and that did not contain claims unacceptable to the Council. The manufacturer pointed out that the statement regarding the Duratron being the "smallest vacuum tube hearing aid" was exact at the time it was written and that the other objections found by the Council were not pertinent or material to the particular instrument under consideration.

In the Council's reply the firm was informed that the advertising examined by the Council was the material which had been submitted by the manufacturer and in accordance with the rules of the Council. Hence the Council assumed that the advertising was for the model Duratron undergoing investigation.

The firm replied that the matter had been placed in the hands of its attorneys, that the Council has no right to publish a report on the Duratron, saying ". . . we believe that this precedent can be set in regard to willful publication of reports or statements which are not entirely accurate" and that "the entire matter should be given some true spotlight publicity not only in regard to 'Duratron' but in regard to the acceptance of the various other aids which you have accepted." The manufacturer did not submit another instrument for consideration, although ample opportunity was given.

The function of the Council on Physical Therapy is to advise the medical profession and the public concerning the status of the apparatus it is importuned to use and to recommend. As pointed out to the manufacturer in correspondence, the Council has no desire to injure a firm's business. On the other hand the Council is never deterred from its duty to the medical profession by a threat of lawsuit.

An agent for the corporation in Denver has advertised in the Denver Post that the Duratron Hearing Aid is "Accepted by the American Medical Association." The manufacturer explained, when asked about it, that the agent did not have permission to use the acceptance statement.

The Council has given assurance to the C. L. Hofmann Corporation that a resubmitted instrument will be given careful consideration without prejudice.

Since the firm (1) has not submitted a new instrument, (2) has given no assurance that the advertising matter will be revised, (3) has an agent who announced the aid as accepted by the American Medical Association, the Council and its Consultants on Audiometers and Hearing Aids have voted to reaffirm the previous decision declaring the Duratron Hearing Aid not acceptable for inclusion in the Council's list of accepted apparatus.

SILENTAIRE NOT ACCEPTABLE

Manufacturer: Berger Manufacturing Company, 228 North La Salle Street, Chicago.

The Silentaire is a window filter housed in a metal cabinet. Louvers extend across the entire removable front of the cabinet, which is fastened with a set screw and are adjustable to direct the flow of air. Mounted in the chassis are two sirocco blowers and the motor; they are easily removed for repairs. Along the base of the unit, under the motor mounting, is a slot into which slides the filter cell. By adjusting the position of the filter cell, it is possible to have an entire recirculation of the inside air, to admit all outside air or to have a mixture of the two. The adjustments are made with a knob under the filter unit.

The filter cell incorporated in the unit submitted for the Council's consideration is manufactured by the Research Products Company of Milwaukee and is known as the Walton Filter Cell. It consists of a honeycomb series of small paper tubules arranged in layers. Each layer is directed at an angle approximating a right angle to the next layer, in a herringbone effect. The filter cell measures approximately 29 by 10 by 1 inches and is impregnated with a viscous oil.

In the Council's investigation the unit was mounted in a frame between a closed chamber and a room. Greased slides were placed before the outlet louvers of the unit, and then 0.1 Gm. of ragweed pollen which was mixed with 2 Gm. of dust varying in size was admitted to the chamber. The unit was started and the slides were examined for pollen grains and dusts which may have passed through the filtering mediums. Slides removed at intervals during the first hour showed many pollen granules, many clumped and some adhering to dust particles. The unit was then permitted to run for two days, and the pollen mixture was again admitted to the chamber. Although there were fewer pollen grains on the slides at this second observation, there were nevertheless many times more than found in filters which are considered efficient for pollen removal.

This type of filter has a lower efficiency for removal of pollen from the air when fresh and new, the efficiency increasing as the filter loads up; but this is most undesirable when it is to be used in filtering the air for persons who are sensitive to pollen.

The firm submitted six pieces of advertising in the form of one folder, a pamphlet and four one-page dodgers. Some objectionable statements found in the advertising are: "Silentaire Provides Low-Cost Air Conditioning. . . . Silentaire provides the essential health features of air conditioning at a cost within reach of practically everyone. In fact, Silentaire affords all of the advantages of air conditioning except refrigeration and extreme humidity control—and refrigeration may be added to the room at any time." The Council points out that the Silentaire is a window ventilator and in no sense of the word an air conditioner. An air conditioning unit, as defined by the Air Conditioning Manufacturers of America, provides many benefits not provided by the Silentaire.

In view of the results of the Council's tests, the following statement found in the folder is erroneous: "Tests have shown that the filter is 97½% efficient in removing pollen and bacteria—a boon for sufferers from sinus trouble, hay fever and certain types of asthma." Although the Council's tests involved only the elimination of pollen, it is improbable that the filter would be effective in the removal of bacteria, since it was ineffective in the removal of pollen.

One of the dodgers is entitled "Hay Fever Relief for Millions of Sufferers," and this statement is unsubstantiated by the investigator's report.

Much is made of what the pamphlet calls "The evils of the open window," and this unsubstantiated statement is made: "Science and experience have proved indisputably that the open window is a dangerous menace to physical and mental well being."

The Council voted not to accept the Silentaire for inclusion on its list of accepted devices because it is ineffective in the removal of pollen and because of the objectionable advertising.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

OFFICE OF THE COUNCIL.

SULFATHIAZOLE (See THE JOURNAL, Jan. 25, 1941, p. 308).

Sulfathiazole-Sharp & Dohme.—A brand of sulfathiazole-N. N. R.

Manufactured by Sharp & Dohme, Inc., Philadelphia. No U. S. patent or trademark.

Tablets Sulfathiazole-Sharp & Dohme, 0.5 Gm. (7.7 grains).

NICOTINIC ACID (See New and Nonofficial Remedies, 1940, p. 524).

The following additional dosage forms have been accepted:

Tablets Nicotinic Acid, 20 mg.

Prepared by the National Drug Co., Philadelphia.

Tablets Nicotinic Acid, 50 mg.

Prepared by the National Drug Co., Philadelphia.

Tablets Nicotinic Acid, 100 mg.

Prepared by the National Drug Co., Philadelphia.

The following products have been accepted:

NICOTINIC ACID-WYETH.—A brand of nicotinic acid-U. S. P. Manufactured by John Wyeth & Brother, Inc., Philadelphia.

Ampoules Solution Nicotinic Acid, 10 mg., 10 cc.: Each cubic centimeter contains 1 mg. of nicotinic acid in sterile physiological solution of sodium chloride.

Ampoules Solution Nicotinic Acid, 100 mg., 50 cc.: Each cubic centimeter contains 2 mg. of nicotinic acid in sterile physiological solution of sodium chloride.

Tablets Nicotinic Acid, 25 mg.

Tablets Triturates Nicotinic Acid, 50 mg.

BISMUTH SUBSALICYLATE (See New and Nonofficial Remedies 1940, p. 150).

The following product has been accepted:

Bismuth Subsalicylate in Oil with Chlorobutanol 3%.—Each cubic centimeter contains bismuth subsalicylate-U. S. P. equivalent to 0.05 to 0.06 Gm. of bismuth suspended in peanut oil. Three per cent chlorobutanol is added as a preservative and for its local anesthetic properties. Marketed in 2 cc. ampules and bottles of 20 cc., 60 cc. and 100 cc.

Prepared by Endo Products, Inc., Richmond Hill, N. Y.

SODIUM MORRHUATE (See New and Nonofficial Remedies, 1940, p. 486).

The following products have been accepted:

Ampules Sodium Morrhuate 5% and Benzyl Alcohol 2%, 2 cc.: Each cubic centimeter contains 0.05 Gm. sodium morrhuate and 0.02 Gm. benzyl alcohol in aqueous solution.

Prepared by the Lakeside Laboratories, Inc., Milwaukee.

Ampules Sodium Morrhuate 5% and Benzyl Alcohol 2%, 5 cc.: Each cubic centimeter contains 0.05 Gm. sodium morrhuate and 0.02 Gm. benzyl alcohol in aqueous solution.

Prepared by the Lakeside Laboratories, Inc., Milwaukee.

Vial Sodium Morrhuate 5% and Benzyl Alcohol 2%, 30 cc.: Each cubic centimeter contains 0.05 Gm. sodium morrhuate and 0.02 Gm. benzyl alcohol in aqueous solution.

Prepared by the Lakeside Laboratories, Inc., Milwaukee.

CARBROMAL (See New and Nonofficial Remedies, 1940, p. 167).

The following dosage form has been accepted:

Carbromal Tablets, 5 grains.

Prepared by John Wyeth & Brother, Inc., Philadelphia.

NICOTINIC ACID AMIDE (See New and Nonofficial Remedies, 1940, p. 526).

The following dosage form has been accepted:

Tablets Nicotinic Acid Amide, 50 mg.

Prepared by John Wyeth & Brother, Inc., Philadelphia.

PHENOLSULFONPHTHALEIN (See New and Nonofficial Remedies, 1940, p. 223).

The following dosage form has been accepted:

Ampuls Phenolsulfonphthalein-Breon: One cc. of solution contains 6 mg. of phenolsulfonphthalein in the form of its sodium salt, in physiological solution of sodium chloride.

Prepared by George A. Breon & Co., Inc., Kansas City, Mo.

SATURDAY, APRIL 19, 1941

MENTAL HEALTH IN WAR TIME

If a normal, healthy impulse is forcibly repressed, according to Sir Walter Langdon-Brown,¹ it comes to the surface again in an abnormal form. If an evolutionary demand meets opposition from a nation which is convinced that its culture is the only one really worth having, the consequences to civilization prove serious. World War II is in essence therefore, he believes, the result of an attempt to stem the tide of an evolutionary process tending toward greater internationalism. Both constructive and destructive impulses are present in the human mind, and at times the destructive element predominates in society. The destructive impulse, Langdon-Brown believes, is rationalized by the claim that the old state of affairs was so bad that it had to be destroyed before anything better could take its place. There are those in our own country who even now are advocates of this philosophy. Since the ordinary person wants nothing more than to be left in peace, it has been, Langdon-Brown points out, a common device of absolute rulers to distract attention from internal difficulties by telling the people that some other nation is trying to deprive them of their heritage. The side effects of these psychologic conflicts are interesting: nations at war look instinctively for a leader; in times of national anxiety there is a regression to certain primitive mental traits, which is well illustrated in Germany by the ritual of driving nails into the gigantic wooden image of Hindenburg. A more common tendency is the making of myths—an escape from reality into fantasy. Rumors become rife and tend to exaggeration beyond all basis of fact. Curiously enough, spreading bad news appeals to vanity. Where facts are few, rumors are many. Both the demand for leadership and the reliance on myth and rumor arise from the same cause, and, as gregarious animals, we are all suggestible and never more so than when in danger. Mr. Wilfred Trotter pointed out that the physical dependence of the infant

develops later into suggestibility, which is psychic dependence—a necessary prerequisite of group life and activity. The dependence of infantile life thus develops into the interdependence of social and communal life. The individual, therefore, cannot be considered as a separate unit but only in relation to his social and communal surroundings.

The greatest enemy of mental health, Langdon-Brown states, is fear. The genesis of fear is the survival and sometimes the perversion of a defensive mechanism of great antiquity and real value: alertness in the presence of danger by which the whole organism is keyed for action. The mechanism is activated through the sympathetic nervous system, which prepares the body for fight or flight. If action is inhibited, however, the same mechanism produces fright. Then, as Crile has put it, the individual becomes like a motor car with the clutch thrown out: gasoline is consumed and the whole car may tremble from the violent action of the engine, but the car does not move. Thus scientifically the best corrective of fear is action.

A distressing form of fear is the fear of being frightened. This is clearly due to a conflict between two powerful instincts—the instinct of self preservation and the herd instinct. The best antidote is action as a member of a community, especially if under suitable leadership. The essentially disadvantageous position of the civilian in war time as compared with the soldier is thus clarified. The former has neither had the disciplinary training nor has he, as a rule, the advantages of community action.

The general experience in Britain so far bears out the report of a conference of medical men convened before the active stage of war began. They stated that an exaggerated estimate had been formed of the liability of war to produce nervous breakdowns. This has received substantiation since the intensified air raids on Britain have been in progress, for few nervous breakdowns have occurred in spite of the suffering and material loss. A writer in the *British Medical Journal* has explained this fact in an interesting way:

With the constant threat to the existence of the entire community constituted by repeated and indiscriminate bombing, a superb scapegoat is at hand. . . . The facility with which one can now project one's fear and anxieties is likely to be the most important one in preventing such breakdowns. The herding together of individuals in shelters in the face of common danger and the leveling-out process in society which is consequent upon universal hardship have no doubt been essentially responsible. Further, the opportunity for dramatization afforded by narrow escapes, etc., is a decided factor.

The danger underlying the herd feeling is panic, for groups are suggestible in a wrong as well as a right direction. Therefore, Langdon-Brown says, any one who goes about suggesting that an epidemic of nervous breakdowns is likely, for which there is really no ground, is doing what he can to produce panic. In addition to cooperative action as a means of preserving mental health in war time, Langdon-Brown considers that

1. Langdon-Brown, Walter: *Mental Health*, *Nature* 147: 193 (Feb. 13) 1941.

physical fitness undoubtedly helps. Sufficient sleep is also important, as are cheerful surroundings. For these reasons, shelter-life is apt to have an evil effect in the war of nerves. The blackout, unless countered by light within, also serves to contribute to the depression of nerves.

PHYSICAL DEFECTS OF DRAFTED MEN

Britten and Perrott¹ of the United States Public Health Service have summarized statistical data bearing on the physical defects observed in men examined during the draft of 1917-1918. The information is of particular interest at this time in connection with a suggested program of physical rehabilitation of registrants disqualified for general military service.² Furthermore, it affords some indication of the number of men who will be classified as unavailable for duty with the armed forces during the present period of selective service owing to physical impairment.

The information contained in the report is based largely on a study of a particular group of drafted men, the so-called second million, who were examined at camp after May 1, 1918. In addition, local board data, limited largely to reexaminations made under an order promulgated by the President on Nov. 8, 1917, were also considered. On this basis 21.3 per cent of drafted men were rejected, 9.9 per cent were placed in limited service groups and 52.1 per cent were found to have defects. Thus, about one third (31.2 per cent) were classified as not available for general military service. If this percentage should hold true at present, about one million, two hundred thousand men will have to be examined to meet the quota of eight hundred thousand men expected early this summer.

Of especial value are data on the prevalence of defects observed in those who were rejected or accepted for only limited service. Among the more important conditions were defective vision with a rate of 40.8 per thousand drafted men, crippled or paralyzed members 38.7, flat feet 32.4, underweight 29.6, vascular diseases of the heart 27.8, tuberculosis (all forms) 24.3, defective and deficient teeth 24.2, hernia 21.0 and mental deficiency 12.0. Numerous other defects, including blindness in one or both eyes, venereal diseases, defective hearing, otitis media, curvature of the spine, varicose veins and varicocele, goiter, hypertrophic tonsillitis, lost upper extremities, lost lower extremities, enlarged inguinal rings and tachycardia to mention only the more prominent, were also commonly observed, but in all cases the rate was considerably lower than that given for the first mentioned defects. Many of the diagnosis groups represent defects of which a large percentage may be remediable. As pointed out by Britten and Perrott,

the most frequently occurring of these conditions are defective vision, underweight, tuberculosis, defective and deficient teeth, hernia and venereal diseases.

ZINC AND TISSUE ENZYMES

Health depends largely on the maintenance of the enzyme systems within the cells of the body. Accordingly, substances in foods which serve as structural units of certain of these enzymes have a peculiar importance in the animal economy. A number of the vitamins function as essential components of enzyme systems concerned with processes of oxidation. Thus thiamine in the form of a pyrophosphoric acid ester is the enzyme cocarboxylase, important in the oxidation of pyruvic acid, an intermediate in carbohydrate metabolism. In a somewhat similar manner riboflavin is present in the yellow oxidation ferment of Warburg, and nicotinic acid functions as coenzyme in still another enzyme system. Now it appears from a recent detailed report by Keilin and Mann¹ that zinc, one of the trace elements in nutrition, is a constant ingredient of purified preparations of carbonic anhydrase.

Carbonic anhydrase has been known since 1933, when Meldrum and Roughton described its presence in the red blood corpuscles. Relatively high concentrations also have been found in the gastric mucosa, where the enzyme may be involved in the formation of the hydrochloric acid of the gastric juice. Carbonic anhydrase serves to catalyze both the breakdown and the synthesis of carbonic acid into carbon dioxide and water. It enables blood flowing through the tissues or the lungs to take on or give up carbon dioxide in a remarkably efficient manner. The demonstration of the presence of zinc in the molecule is of special interest, not only because of the importance of this enzyme in the dynamics of carbon dioxide transport by the blood, but also because this is the first instance of the existence of a biologic compound containing zinc which is important to higher mammals.

According to the calculations of the British investigators, 1 liter of blood contains about 1 Gm. of carbonic anhydrase. In the blood of the normal adult there would be a total of about 18 mg. of zinc in this form. Purified preparations of the enzyme made by different methods uniformly contained zinc to the extent of about one third of 1 per cent. This figure happens to be identical with the value for the amount of iron contained in hemoglobin. But how the zinc is combined with the protein part of the enzyme molecule, and what may be the nature of the prosthetic group, if present, are questions that still remain to be answered.

The observation that carbonic anhydrase contains zinc has been verified and extended by Hove, Elvehjem and Hart² at the University of Wisconsin. These investi-

gators were unable, however, to observe any significant decrease in the concentration of this enzyme in the blood of rats which had been reared on diets deficient in zinc. The dietary requirements for zinc are undoubtedly small, and the basal rations used, although carefully purified, were not entirely devoid of zinc. Previously it had been shown that animals reared on diets carefully freed from nearly all traces of zinc do not grow normally, have a lower zinc content of the body and have poor digestive ability associated with a decrease in the concentrations of pancreatic trypsin and amylase and of intestinal phosphatase. Thus zinc may function in a number of ways in the body. These observations afford an explanation of the indispensable nature of this element in the diet. While there would seem to be little likelihood of a lack of this essential substance in the diet of human beings, the present contributions to a knowledge of the physiology of zinc offer one more illustration of the dependence of man on the "little things" in foods.

Current Comment

FATIGUE

The development of fatigue involves changes in many elements of the neuromuscular apparatus. The role of the central nervous system in muscular fatigue is significant, especially in persons engaged in static work. Simonson and Enzer¹ have recently utilized the fusion frequency technic for the quantitative measurement of fatigue of the nervous system. Subjects are placed before a light, in front of which is a rotating shutter giving rise to flickers of light. The fusion frequency of flicker is stated to be the rate of the light flashes which is just necessary to give to the subject the effect of continuous illumination. Nineteen subjects were tested fifty-three times for their fusion frequency at the beginning and end of the day's work. At the end of the day the ability to discriminate flicker was lessened. While the number of experiments was relatively small, the results were uniform. Such factors as a cold or insufficient sleep appeared to be equivalent to fatigue from work, according to the test for fusion frequency. In addition, Simonson, Kearns and Enzer² reported that the improved sense of well-being of eunuchs and castrate men following androgen therapy was reflected in the increased fusion frequency of flicker. This apparently indicates that the resistance of the central nervous system to fatigue in these patients was increased. This experimental work is promising with regard to the possibility of evaluating the effect of stimulants or of various agents used to relieve tiredness and for measuring the efficiency of workers under various conditions. The possibility of utilizing such experiments in connection with preparations for defense makes this contribution most timely.

SEXUAL CURIOSITY OF CHILDREN

In a recent examination of the degree and nature of sexual curiosity of small children, Conn¹ pointed out that there is no such thing as not giving sexual instruction. Parents, he says, have worried too much about giving children the proper answers and not enough about becoming the proper persons. His report is based on a statistical evaluation of sexual questions contributed by 200 children representing different social strata. The actual questions quoted reveal the completely normal growth of sexual curiosity of children paralleling that which they exhibit for other aspects of the world around them. Not all parents can hope to attempt the disassociated objectively scientific attitude of the trained physician or conquer embarrassment, apprehension and inarticulateness, nor is such an attitude necessary for them. However, Conn's experience indicates that much parental enlightenment would come from taking the time to ask a child "Why do you want to know that?" or "What is your opinion about that?" The degree of sexual interest and the level of understanding at the particular age of the child would be much better appreciated, he believes, and questions better answered by this type of parental investigation. Only the child himself can give information regarding what he actually wants to know. The child is not as fragile a creature as some seem to believe, and collections of words count for much less than training for effective living.

PREVENTION OF CANCER IN PHYSICIANS

Almost one out of every ten deaths among physicians is due to cancer, according to tables prepared from a list of the deaths among physicians in the United States and Canada from 1935 to 1939 inclusive:

	Deaths from All Causes	Deaths from Cancer	Percentage of All Deaths Attributed to Cancer
1939	3,879	357	9.2
1938	3,768	334	8.9
1937	3,398	311	9.2
1936	3,581	306	8.5
1935	3,491	282	8.1

Since notoriously many physicians do not follow their own advice in having personal periodic physical examinations, many of these deaths from cancer might have been prevented by early diagnosis and treatment. In accordance with the belief that the periodic physical examinations of organized groups of apparently healthy persons may prove helpful in detecting early curable cancer, the American Society for the Control of Cancer proposes such a program for physicians through the local county medical societies which would make possible a complete physical examination once a year by qualified experts in the state. Such specialists, the society believes, could be selected by state cancer committees. One month during the year could be set aside for the examinations. A supplementary advantage would be that physicians would be practicing what they preach. As a result, a powerful influence would be exerted on furthering the educational program of prevention of cancer by periodic examination.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

THE PREHABILITATION OF REGISTRANTS—A PLAN FOR RENDERING REGISTRANTS FIT FOR EXAMINATION AND SERVICE

MEDICAL ADVISORY COUNCIL OF SELECTIVE SERVICE OFFERS HERE A SIMPLE PLAN WHEREBY REGISTRANTS THEMSELVES MAY INSURE THEIR OWN FITNESS AND THEREBY QUALIFY THEMSELVES FOR MILITARY SERVICE

We are now in the midst of a national emergency. War threatens us constantly. For purposes of defense, an army is in the making. The Selective Service system has been charged with the procurement of men for this army. The need is great—some 16,500,000 men between the ages of 21 and 36 years have been registered. As their order numbers are reached, such men must appear before their local boards for examination and classification; that is, for selection, deferment or rejection. In the event that the registrant is considered suitable by the local civilian boards, he is sent up to the Army Induction Station and taken into the ranks to become a soldier, provided he is acceptable and satisfies the physical, mental and moral requirements of the Army.

Only men who can meet high standards are acceptable to the Army. Only those are selected who are judged capable of standing up under a year's strenuous military training, subsequently serving efficiently for ten years in the Reserve Corps of the Army. Of such men, the Army will require 800,000 this year, and 900,000 in each of the succeeding four years. These men should be of the type that can not only serve best the needs of the country as soldiers in the present emergency, but, of the kind who may actually be benefited by military training and contacts; and who may exercise constructive patriotic leadership, such as will inspire national confidence.

From the foregoing it is evident that the country is attempting to select as soldiers only the very cream of its young manhood. Each and every individual is "hand-picked," critically inspected and carefully tested before he is admitted to the Army. Only the fit are selected as soldiers. It is obvious, therefore, under these conditions, that selection should be regarded as a stamp of efficiency, a signal honor and a distinct privilege.

To date the number of deferments and rejections has been large, so great indeed that considerable concern is evident in Selective Service, in the Army and in the country as a whole. It is estimated that less than 15 per cent of the 16,500,000 registrants are being classed as available for general military service. This situation obviously calls for analysis and for the adoption of remedial measures.

It is estimated that approximately 5,000,000 have been classified and that more than 600,000 have been physically examined. Selective Service local boards at the present time are classing 20 per cent of those physi-

cally examined in class IV-F, as being totally disqualified for military service, 12 per cent in class I-B, as being fit for limited military service only, and 68 per cent in class I-A, as being qualified for general military service. Of the 68 per cent classed as being qualified for general military service and sent to the Army Induction Station, about 13 per cent are being rejected because of physical, mental, moral, administrative and other reasons. This means that about 60 per cent of all registrants physically examined by the local boards are accepted into the Army.

The situation is at present a matter of national concern. Many questions are being asked and various solutions of the problem offered. The crucial questions are these: Why is so large a percentage of the youth of the country being rejected? Are these men really unfit physically or mentally? What is the nature of the unfitness? What can be done to remedy the situation?

A PLAN FOR PREHABILITATION

Criticism has been abundant and bitter and is on the increase. It has fallen on Selective Service and especially on the induction boards and on the whole system of medical examinations as now in operation. Whether the criticism is justified or not is aside from the question. Obviously, some remedies are needed and something must be done to diminish the number of rejections, something to rehabilitate registrants suffering from remediable defects and, in addition, something to improve the physical condition of the youth and of the people of the country as a whole.

With this in view, the Medical Advisory Council to Selective Service offers this plan for prehabilitation of registrants. The project plans to prehabilitate registrants and to have them recognize and remove their remediable defects prior to presenting themselves to their local board of Selective Service or the induction board of the Army. The plan is simple, easily understood, can be readily carried out, and should result in a marked diminution in the percentage of rejections and a proportionate increase in the number of men inducted into the Army of those physically examined.

The plan provides that (1) registrants familiarize themselves with the physical standards required, (2) registrants apply to their local physicians and dentists if they fall short of the stipulated standards, (3) family physicians and dentists correct defects if they are

remediable, and (4) registrants carry certificates of prehabilitation to local and induction boards at the time they present themselves for examination.

The purposes of this plan are (1) to afford the registrant participation in his own prehabilitation, (2) to select more suitable men and increase the number of inductions, (3) to improve national morale by decreasing the number of rejections, (4) to cultivate in the registrants the spirit of self reliance, initiative and patriotism, and (5) to effect prehabilitation through maintaining the normal relationship of the patient to his family doctor and dentist.

The mechanism for effectively carrying out the plan is now largely set up and available. The sole additional requisites are (1) an appropriate committee in each state representing all the participants, and (2) sufficient funds to support the educational program involved. Since, according to the plan, it will function through the medical and dental professions of the country, the support of these two professions is definitely assured.

The program of education involves the dissemination of information to the 16,500,000 registrants concerned and to all the members of the medical and dental professions. This can be done by preparing and distributing special pamphlets, epitomizing the physical requirements, and publicizing all pertinent information by the press (lay and professional), by the radio, by the pulpit, and by means of moving pictures. This program will need the support of educational, health, military and religious organizations throughout the entire country. The approach to prehabilitation must be made on a national basis.

So far as the registrant is concerned, he need only familiarize himself with the medical and dental requirements and present himself for advice and treatment to his local doctor or dentist, in the event that he feels that he falls short of the designated requirements. The family doctor, being familiar with the registrant's family background, his past illnesses and his personal attributes, is the man *par excellence* to determine the nature and the significance of the defects and to advise best as to what, if anything, should be done.

Likewise the family doctor and dentist are in the best position to remedy the existing defects, if they are readily remediable. If, however, of a more serious nature, the doctor—being thoroughly familiar with the registrant's physical, mental, moral and financial status, and also with the professional personnel and with the hospital and institutional facilities of the locale—can best direct the registrant to the proper medical service, be it a free or pay, medical or dental clinic. In other words, the family doctor and dentist can remedy existing defects themselves, if easy of remedy, or can direct the registrant to the best local source for the particular professional service to be found in the immediate locality.

Presentation of a certificate of prehabilitation by the registrant to the local and induction boards will indicate his desire to serve his country in its time of need. After this plan has been put into effect, those who appear before these various boards and are found suffering from remedial defects will reveal thereby their personal failure to do their part in the national preparedness program. The possession of a certificate of prehabilitation on the other hand will tend to indicate character and the possession of desirable qualities—intelligence, forethought, initiative, fitness, and a desire to serve—all of which must go into the making of a good soldier. Such a certificate will connote *esprit de corps*, morale, and the will to succeed. Above all else, an Army needs morale, that intangible something which leads to ultimate achievement—such morale as has always characterized the armies of the United States.

It is hoped that this plan of prehabilitation will make a deep appeal to and have the support of the registrants themselves, their families and the nation. It should serve to diminish the number of rejections, with all the attendant humiliation and inconvenience involved. It should give him a plus instead of a negative mark. It should stamp many registrants with the mark of success instead of with the sign of failure. Above all, it should bring into the Army more and better soldiers: men who have helped to prepare themselves and are eager and willing to defend their homes, their country, and democracy.

SENIOR MEDICAL STUDENTS TO BE ENROLLED IN RESERVE CORPS

All senior medical students graduating from fully accredited medical schools in the United States this spring will be afforded the opportunity of being appointed first lieutenants in the Medical Corps Reserve of the Army. The students who did not pursue formal instruction in the Reserve Officers' Training Corps will be eligible for appointment in the Medical Corps Reserve on a par with those students who did have the advantage of such instruction.

These appointments will be made by the War Department on the recommendation of the dean of each approved medical school and on his certification that the applicant will be granted the degree of doctor of medicine on a specified date. At those schools which require a hospital internship for such degree, appointment will be made on certified evidence of the prospective successful completion of the prescribed four year course of medical instruction. Commissions and letters of appointment will be delivered on graduation. The newly commissioned Medical Reserve officer should then present his letter of appointment to his local Selective Service board for reclassification.

No Medical Reserve officer is considered eligible for extended active duty until he shall have completed at least one year of postgraduate hospital internship. Therefore, members of this year's graduating class who are appointed in the Medical Corps Reserve, either through medical units of the R. O. T. C. or under the aforementioned procedure, will not be available for active duty until July 1942. Deferment of such duty beyond that time will depend on the current requirement for medical officers.

In view of the anticipated annual demand for approximately four thousand Reserve medical officers to replace those who have completed twelve months training and service, it is doubtful that such deferments will be possible.

The War Department approved appointment of senior medical students on February 18, and appropriate instructions were directed to the commanding general of each corps area. The deans of the several approved medical schools will receive complete instructions, together with appropriate application blanks, in the near future from the commanding general of the corps area in which the institution is located.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY

SECOND CORPS AREA

The following medical corps reserve officers have been ordered to extended active duty by the Commanding General of the Second Corps Area, which comprises the states of New York, New Jersey and Delaware:

BAER, Irving, 1st Lieut., Bayonne, N. J., Fort Tilden, N. Y.
DICKINSON, Meredith M., 1st Lieut., New York, Fort Bragg, N. C.
DOUST, Alfred W., 1st Lieut., Syracuse, N. Y., Pine Camp, N. Y.
HUDSON, Floyd I., 1st Lieut., Rehoboth Beach, Del., Fort Adams, R. I.
KALMAN, Manuel, 1st Lieut., New York, Fort Monmouth, N. J.
KUMOW, Nicholas I., 1st Lieut., Johnson City, N. Y., Pine Camp, N. Y.
LACEY, Warren W., 1st Lieut., Brooklyn, Fort Monmouth, N. J.
LANDES, Alexander V., 1st Lieut., New York, Fort Hamilton, N. Y.
LEIKIND, Elias R., 1st Lieut., Brooklyn, Fort Monmouth, N. J.

SIXTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Sixth Corps Area, which comprises the states of Wisconsin, Illinois and Michigan:

BERLIEN, Ivan C., 1st Lieut., Detroit, U. S. Army Induction Station, Detroit.
BERRY, Leonidas H., 1st Lieut., Chicago, Station Hospital, Camp Livingston, La.
BURACK, Samuel, 1st Lieut., Kankakee, Ill., U. S. Army Induction Station, Chicago.
CAMPBELL, Everett W., 1st Lieut., Chicago, Station Hospital, Camp Livingston, La.
CRESS, Henry N., 1st Lieut., Chicago, Station Hospital, Camp Livingston, La.
DEURLOO, Henry W., 1st Lieut., Romeo, Mich., Station Hospital, Fort Sam Houston, Texas.
HENDERSON, Allison B., 1st Lieut., Detroit, Station Hospital, Fort Bragg, N. C.
HOWARD, Wayne Cox, 1st Lieut., Chicago, Station Hospital, Fort Bragg, N. C.
JEFFERSON, Ronald N., 1st Lieut., Chicago, Station Hospital, Camp Livingston, La.
JOSSELYN, Livingston E., 1st Lieut., Highland Park, Ill., Station Hospital, Fort Sheridan, Ill.

SEVENTH CORPS AREA

The following medical reserve corps officers have been ordered to extended active duty by the Commanding General, Seventh Corps Area, which comprises the states of North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Kansas, Missouri, Arkansas and Wyoming:

ANDERSON, Robert Caroden, 1st Lieut., Topeka, Kan., Induction Station, Fort Des Moines, Iowa.
BATTERTON, Robert Van, Captain, Rawlins, Wyo., Station Complement, Fort Riley, Kan.
BENNETT, Byron Alexander, Major, Little Rock, Ark., 43d Engineers, Camp J. T. Robinson, Ark.
BENNETT, Geoffrey Watts, 1st Lieut., Oskaloosa, Iowa, Induction Station, Fort Des Moines, Iowa.
BERMAN, William, 1st Lieut., St. Louis, Station Complement, Fort Des Moines, Iowa.
CLINE, Harold Hadley, 1st Lieut., Piedmont, Mo., Station Hospital, Camp J. T. Robinson, Ark.
CLINTON, Lloyd Brandon, Captain, Carthage, Mo., Induction Station, Fort Leavenworth, Kan.
COEN, Robert Archibald, 1st Lieut., Ingleside, Neb., Induction Station, Fort Omaha, Neb.
COUGHLAN, Charles Harold, Captain, Fort Dodge, Iowa, Induction Station, Jefferson Barracks, Mo.
DAY, Romney Naxwell, 1st Lieut., St. Joseph, Mo., Station Complement, Camp J. T. Robinson, Ark.
DECKER, Rudolph Frederick, Captain, Byron, Neb., Induction Station, Fort Leavenworth, Kan.
DEWEY, Charles Homer, Captain, Wellington, Kan., 43d Engineers, Camp J. T. Robinson, Ark.
ERICKSON, Clifford Orvis, 1st Lieut., Rochester, Minn., Induction Station, Fort Snelling, Minn.
FLICKINGER, Roger Richard, 1st Lieut., Mason City, Iowa, Station Hospital, Jefferson Barracks, Mo.
GARDNER, Harold Oscar, 1st Lieut., Waterloo, Iowa, Induction Station, Jefferson Barracks, Mo.
GROSSMAN, Marvin, 1st Lieut., Salem, Mo., 43d Engineers, Camp J. T. Robinson, Ark.
HALL, Frederic Wilhelm, 1st Lieut., Winfield, Kan., Induction Station, Fort Des Moines, Iowa.
HAWKINSON, Raymond Paul, Captain, Robbinsdale, Minn., Induction Station, Fort Leavenworth, Kan.
HERMAN, Morris, 1st Lieut., St. Louis, 35th Division, Camp J. T. Robinson, Ark.
HUBER, Melvin Joseph, Captain, St. Louis, Induction Station, Jefferson Barracks, Mo.

MANSKER, Joseph S., 1st Lieut., New York, Pine Camp, N. Y.
PREEFER, Raymond R., 1st Lieut., Brooklyn, Fort Jackson, S. C.
RICCIARDELLI, Emanuel F., 1st Lieut., Jersey City, N. J., Carlisle Barracks, Pa.
ROSENZWEIG, Henry, 1st Lieut., Brooklyn, Induction Station, Albany, N. Y.
SCHWARTZ, Albert M., 1st Lieut., New York, Fort Benning, Ga.
SERLIN, Nathan J., 1st Lieut., Brooklyn, Fort Benning, Ga.
SHULACK, Norman R., 1st Lieut., Brooklyn, Fort Benning, Ga.
SMOLEV, Heyman, Captain, Buffalo, Fort Benning, Ga.
SOBIN, Julius, Major, Newark, N. J., Fort Tilden, N. Y.
STRAHAN, Edward B., 1st Lieut., Buffalo, Pine Camp, N. Y.
THUMIN, Mark, 1st Lieut., Long Beach, L. I., N. Y., Fort Jackson, S. C.
WOHL, Charles S., 1st Lieut., Brooklyn, Fort Benning, Ga.

KINZER, Richard E., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
KLIGERMAN, Sidney, 1st Lieut., Chicago, Station Hospital, Fort Sheridan, Ill.
MATTHEWS, Henry B., 1st Lieut., Chicago, Station Hospital, Camp Livingston, La.
MILLER, Charles H., Jr., Captain, Vienna, Ill., Station Hospital, Fort Sam Houston, Texas.
MILLER, Herbert P., Lieut. Col., Rock Island, Ill., Station Hospital, Fort Sheridan, Ill.
PEARSON, Emmet F., Captain, Springfield, Ill., Station Hospital, Fort Sheridan, Ill.
ROBINSON, Harold A., 1st Lieut., Detroit, Station Hospital, Scott Field, Ill.
ROSENBLUM, Alfred H., 1st Lieut., Chicago, Station Hospital, Fort Custer, Mich.
SALBERG, Arthur K., 1st Lieut., Chicago, U. S. Army Induction Station, Chicago.
THOMAS, Alfred E., Jr., 1st Lieut., Detroit, Station Hospital, Fort Bragg, N. C.
WAFFLE, Robert L., 1st Lieut., Fond Du Lac, Wis., Station Hospital, Fort Sheridan, Ill.
WASHINGTON, John C., 1st Lieut., Evanston, Ill., Station Hospital, Fort Bragg, N. C.
WHITE, Noland W., 1st Lieut., Centralia, Ill., Station Hospital, Scott Field, Ill.
ZOLT, Nathan, 1st Lieut., Chicago, Station Hospital, Fort Sheridan, Ill.

HYATT, Charles Nelson, Jr., 1st Lieut., Humeston, Iowa, 6th Division, Fort Francis E. Warren, Wyo.
JENKINS, Paul Alexander, 1st Lieut., Lebanon, Mo., 41st Division, Camp Murray, Wash.
KURTH, Clarence Joseph, 1st Lieut., Council Bluffs, Iowa, Station Hospital, Fort Leonard Wood, Mo.
LISTER, Kenneth Evan, 1st Lieut., Chariton, Iowa, Induction Station, Fort Snelling, Minn.
LOFTIS, William Osler, 1st Lieut., Pocatontas, Ark., Induction Station, Camp J. T. Robinson, Ark.
LOWRY, Charles Frederick, 1st Lieut., Kansas City, Mo., Station Complement, Fort Leonard Wood, Mo.
MAYNARD, Ross Ewing, 1st Lieut., Pine Bluff, Ark., Induction Station, Fort Omaha, Neb.
MCLELLAN, Allan, Major, Casper, Wyo., Station Complement, Fort Francis E. Warren, Wyo.
O'DOWD, James Austin, Captain, St. Louis, Station Hospital, Fort Riley, Kan.
PATTON, Doyle LeRoy, 1st Lieut., El Dorado, Ark., 7th Division, Fort Ord, Calif.
PEEK, Levin Henderson, 1st Lieut., Lake City, Iowa, Induction Station, Jefferson Barracks, Mo.
POST, Cyril Andrew, 1st Lieut., St. Louis, 43d Engineers, Camp J. T. Robinson, Ark.
RICH, Edward Wallace Lee, 1st Lieut., Grand Island, Neb., Station Hospital, Fort Snelling, Minn.
ST. JOHN, Dewey, Captain, St. Louis, Induction Station, Fort Des Moines, Iowa.
SICELUFF, Joseph Grice, 1st Lieut., Springfield, Mo., Station Hospital, Fort Leonard Wood, Mo.
STEFFENS, Lincoln Felch, Captain, Dubuque, Iowa, Induction Station, Fort Snelling, Minn.
STEFFEY, Fred Lee, 1st Lieut., Keokuk, Iowa, Induction Station, Fort Snelling, Minn.
STOTTS, Charles Stephen, 1st Lieut., Fredonia, Kan., Station Complement, Camp J. T. Robinson, Ark.
SUTTON, Bruce Ralph, 1st Lieut., Minden, Neb., 48th Surgical Hospital, Fort Francis E. Warren, Wyo.
VAN BESIEEN, George Joseph, 1st Lieut., Decorah, Iowa, Induction Station, Fort Omaha, Neb.
VINJE, Ralph X., 1st Lieut., Beulah, N. D., Station Hospital, Fort Riley, Kan.
VIRANT, John Aloysius, 1st Lieut., St. Louis, Station Hospital, Jefferson Barracks, Mo.

Orders Revoked

DOUGLAS, Thomas Harrelson, Jr., 1st Lieut., Osceola, Mo., Fort Knox, Ky.
MILSTER, Clyde Rogers, 1st Lieut., St. Louis, Fort Leonard Wood, Mo.

TRAINING AREA FOR PUBLIC HEALTH PERSONNEL

The public health facilities around military and industrial plants in Maryland will become a training area for United States Public Health Service personnel, Surgeon General Parran has announced.

Local health organizations in certain Maryland counties will be supplemented with physicians, sanitation engineers and public health nurses from the Public Health Service. Laboratory equipment, drugs, biologic products, office supplies, clerks, stenographers, autos and trucks also will be provided. Dr. L. B. Byington of the U. S. Public Health Service, who has been appointed deputy state health officer, will serve as liaison agent between the Maryland State Health Department and the federal health service. Numerous other states which have defense areas will receive public health reinforcements. These provisions are part of an augmented public health program authorized by Congress in connection with national defense.

Linked with the augmented Maryland defense health program is a training course for new personnel of the Public Health Service beginning April 7 at the National Institute of Health, Bethesda, Md. Senior Surg. Mark V. Ziegler has been assigned director of this orientation course. The Surgeon General has appointed the following advisory council to assist in guiding the course:

Dr. Milton J. Rosenau, University of North Carolina.
Dr. Harry S. Mustard, Columbia University.
Dr. John Sundwall, University of Michigan.
Dr. W. L. Leathers, Vanderbilt University.
Dr. Gaylord Anderson, University of Minnesota.
Dr. Cecil K. Drinker, Harvard University.
Abel Wolman, Dr. Eng., Johns Hopkins University.
Ira V. Hiseock, C.P.H., Yale University.
Lieut. Col. Arthur P. Hitchens, University of Pennsylvania.
Miss Katharine Tucker, University of Pennsylvania.

Physicians, engineers, nurses and laboratory technicians selected from civil service lists will be given intensive six weeks courses in public health administration, communicable disease control, local public health problems, laboratory technics, food and milk sanitation, industrial hygiene and venereal disease control. The first four weeks will be devoted to instruction at the institute. The final two weeks will be spent in the field. The Maryland public health staff will assist in this part of the instruction. When the six weeks course is completed, trainees will serve throughout the nation with state and local health departments hard pressed by problems created by industrial and military establishments.

Successive six weeks courses will be given at the National Institute of Health until the personnel provided for under the emergency health and sanitation program have been recruited and trained.

HEALTH OF TRAINEES BETTER THAN IN 1917

Analysis of nine thousand, seven hundred and fourteen rejection reports from about one thousand induction boards throughout the nine corps areas shows that, although three times as many men have been turned down for defective teeth in the current army induction as in that of 1917, the health of the average trainee is better in most other categories.

Rejections because of defects of the lungs, heart, muscles, bones and feet showed the largest decreases. Statistics on a group of 52,918 rejections in 1917 showed that 10.9 per cent of those were due to ailments of the lungs, compared with 3.8 per cent of the 1941 group. Heart defects accounted for 13.7 per cent of the 1917 rejections, 6.5 of those in 1941. "Musculo-skeletal" defects amounted to 10.3 per cent of the 1917 group and only 4.4 per cent in the sample just studied. Defects of the feet were nearly twice as frequent in the 1917 induction as in 1941, 6.4 per cent as compared with 3.4.

Rejections for ear defects nearly doubled, as shown by a percentage of 9 for 1941 as compared with 4.6 in the World War recruits. There was a slight increase in venereal disease, but this was attributed to better methods of testing. Rejections for miscellaneous ailments also increased.

The report analyzed the rejections by geographic areas. Ear defects exceeded the average in the Second, Seventh and Ninth corps area. Lung ailments were higher in the Second and

Third and low in the Fourth corps area. Rejections for heart trouble were higher in the Second and Seventh corps areas. The number of hernias was higher in the Fifth, Sixth and Seventh corps areas. Venereal causes were high in the Fourth and Eighth corps areas. A low percentage of rejections in the Fourth Corps Area was attributed to mental and nervous conditions, while one sixth of the rejections in the Eighth Corps Area were for this cause. Foot defects were low in all areas except the Ninth.

TEAMS OF PSYCHIATRIC ADVISERS

The dissemination by psychiatric advisers of information to all physicians associated with the Selective Service System is expected to insure the wisest selection of men for the Army. Col. Leonard G. Rowntree, chief of the medical division, Selective Service System, speaking before the Psychiatric Institute in New York, pointed out that teams of psychiatrists are working throughout the country to acquaint physicians interested in the recruitment of military manpower with the essential mental requirements of the armed forces.

The record of the first World War mobilization shows "innumerable broken men and shattered lives." In view of this experience, Colonel Rowntree said, the Selective Service System had initiated a program designed to insure the induction of soldiers of the highest mental qualifications.

The program includes the use of teams of psychiatric advisers to inform Selective Service local board physicians on the best methods of eliminating the unfit. Colonel Rowntree said: "It was decided to send out teams of specialists to spread the necessary information throughout the country. These teams have traveled to various centers to meet the local psychiatrists and doctors of the local and induction boards for the purpose of disseminating vital information bearing on the selection of men for the Army. It is hoped that the whole profession of medicine, and psychiatrists in particular, will bend additional effort in every locality to the wisest selection of those men for the Army who can serve to best advantage to themselves, their families and their country."

HOSPITAL STAFF CONTRIBUTES SHARE OF INCOME TO MEMBERS ON ACTIVE MILITARY DUTY

Members of the staff of Mount Sinai Hospital, New York, have developed a plan to aid members who have been called into active military service. Under this plan all members of the staff remaining in civilian practice will contribute a percentage of their net income from practice to a common fund to be used to help the families of members called to military duty. Payments from this common fund will be paid monthly without regard to military rank to the absent member or to his family or designated agent and will be prorated on the basis of the number of years since the doctor's graduation from medical school. The payments will be continued for six months after honorable discharge, and in the event of death or total disability while in military service payments will be continued for two years after the death or the onset of total disability. Payments will begin May 1 with contributions into the common fund of a percentage of the net medical income for 1940, payable in monthly instalments, thus permitting the accumulation of a reserve in excess of the immediate requirements. The fund will be administered by three trustees of the hospital appointed by the president of the hospital, who will be assisted by the president of the medical board and the chairman of the Association of the Junior Medical Staff. The operating costs of administering the fund will be defrayed by trustees of the hospital so that all contributions will be used for the benefit of the participating physicians. To help the families of those in military service further, the hospital staff has agreed that the members on active military duty will receive a percentage of the fees paid by their patients in their absence to other members of the medical staff of the hospital, and these payments will continue for two years after the death or total disability of a staff member. The first member of the attending staff of Mount Sinai Hospital to be called into active military service is Dr. Edgar M. Bick, associate orthopedist.

ORGANIZATION SECTION

REPORTS OF OFFICERS

NOTE.—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc., and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion.—Ed.

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Secretary is respectfully submitted:

MEMBERSHIP

On March 1, 1940 the official membership list of the Association carried the names of 115,381 members. There were 116,266 members recorded on April 1, 1940 and on April 1, 1941 the number of enrolled members was 118,441, the largest number of members that has ever been reported to the House of Delegates.

An accompanying table shows, with respect to each state, the number of counties, the number of component county medical societies, the number of counties in which no societies are now organized, the number of physicians as shown by the Sixteenth Edition of the American Medical Directory, the number of members as reported by each constituent state and territorial medical association on April 1, 1940 and on April 1, 1941 and the number of Fellows in each state and territory.

During the year 1940 the deaths of 1,818 members were recorded.

FELLOWSHIP

On March 1, 1940, 71,168 Fellows were enrolled on the Fellowship roster as reported to the House of Delegates at the New York session, and on April 1, 1940 there were 71,350 Fellows. On April 1, 1941 the Fellowship roster carried 72,504 names, representing an increase over the same date in the previous year of 1,154. This is the largest number of Fellows ever recorded. During the year the deaths of 862 Fellows were reported to the Secretary's office.

ANNUAL CONFERENCE OF SECRETARIES OF CONSTITUENT STATE MEDICAL ASSOCIATIONS

The regular Annual Conference of Secretaries of Constituent State Medical Associations was not held in 1940 for the reason that it was necessary to have a conference of the state chairmen of the Committee on Medical Preparedness. At this conference all the states, with one exception, were represented by the duly appointed state chairmen or by alternates, and a number of secretaries and other officers of constituent state medical associations were in attendance.

FIELD WORK

In response to invitations received from constituent associations and component county or district societies and from other organizations endorsed by these associations or societies, the President, the President-Elect, members of various official bodies of the Association and members of its administrative personnel have appeared before a large number of audiences in all parts of the United States for the discussion of the work of the Association and other matters of important interest to all physicians. Officers and members of official bodies and members of the administrative personnel have also appeared before a large number of lay audiences. The number of such invitations received has increased to such an extent that it is practically impossible to provide speakers for all occasions. It seems to be apparent

that the interest of physicians and laymen in the work of the organized medical profession in the United States is constantly increasing.

In addition to the many requests for speakers that are received from medical organizations and lay groups, there has developed

a growing demand for the participation of official representatives of the Association in conferences with representatives of other organizations and of official agencies of various kinds. An effort has been made to comply with such requests of this nature as seem to be of interest to medicine and in those instances in which it has been felt that the Association could render helpful service to the officers and members of other groups.

EXTRAORDINARY ACTIVITIES OF THE SECRETARY'S OFFICE

In addition to the usual official duties with which the Secretary of the Association has heretofore been concerned, much of his time during the past year has had to be devoted to other and unusual duties. As Secretary of the Committee on Medical Preparedness of the American Medical Association, a large amount of the Secretary's time has been engaged with the activities of that committee.

The Secretary was required to be in Washington, D. C., constantly over a period of seven weeks in attendance on the trial of the case of the *United States v. The American Medical Association et al.*, and at times it has been impossible to give prompt attention to communications received or to comply promptly with official requests. It has been a matter for keen regret that all such requests and demands could not be promptly and efficiently met, and the indulgence of those concerned is respectfully requested.

In closing this necessarily brief report to the House of Delegates, it is the desire of the Secretary to convey an expression of gratitude to all the officers of the Association, to the members of the House of Delegates, to the officers of the constituent associations and component societies and to individual Fellows and members of the Association, all of whom have been both gracious and generous in offering aid and encouragement and in extending many kindly courtesies to the office of the Secretary.

Respectfully submitted,

OLIN WEST, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association:

The Board of Trustees respectfully submits to the House of Delegates of the American Medical Association the following report covering many of the activities of the Association as conducted through its various councils, bureaus and departments during the past year.

The reports of the councils which are standing committees of the House of Delegates are submitted by those councils.

Meetings of the Board of Trustees were held in February, June, September and November in 1940, and meetings of the Executive Committee of the Board were held each month except during April, July, October and December. At meetings of the Executive Committee and the Board of Trustees, representatives of other organizations and groups, particularly representatives of the American Society of Clinical Pathologists, of the American Chemical Society Committee on Chemical Service to Medicine and of the American Pharmaceutical Association, have appeared for the purpose of discussing matters of mutual interest, and it is believed that these conferences have contributed to a better understanding of some important problems and have resulted in the establishment of more cordial and helpful relations between the parties concerned. Meetings of the Board of Trustees are attended by the President, the President-Elect, the Treasurer of the Association and the Speaker of the House of Delegates, and the Vice President of the Association has attended meetings of the Board when it has been possible for him to do so.

Many matters have received careful official consideration by the Board of Trustees that are not referred to in this report. In some instances such matters have been satisfactorily disposed of, while other matters that have been brought to the attention of the Board are still under consideration or have not required official action.

Dr. Austin A. Hayden

Dr. Austin Albert Hayden, Treasurer of the American Medical Association from 1922 to 1933 and, since 1933, Secretary of the Board of Trustees, died in Chicago shortly after the annual session of 1940, on July 10, of coronary thrombosis and chronic interstitial nephritis. Thus ended a distinguished career in ophthalmology, otolaryngology and medical statesmanship. In his professional life Dr. Hayden was active in the work of many medical organizations. He was a fellow of the American College of Surgeons, a member of the American Otological Society and a former president of the Chicago Laryngological and Otological Society and of the Chicago Medical Society. He was also a member of the Chicago Ophthalmological Society, the American Academy of Ophthalmology and Otolaryngology, the American Laryngological, Rhinological and Otological Society, a former president of the American Association of Railway Surgeons and a member of the Institute of Medicine and the Society of Medical History of Chicago. Dr. Hayden was devoted to his work for organized medicine. During the annual session in New York he worked many hours both day and night in his official capacities, not only on the Board of Trustees and in the House of Delegates, but also in charge of entertainment. He was known to all his friends, and particularly to his associates on the Board of Trustees, for his intense activity, his constant courtesy, his genial friendship and his leadership.

Dr. Paul Nicholas Leech

It is with great regret and with a sense of extreme loss to the Association and to the cause of scientific medicine that the Board of Trustees reports the death of Paul Nicholas Leech, Ph.D., which occurred suddenly on Jan. 14, 1941. At the time of his death, Dr. Leech was Director of the Division of Foods, Drugs and Physical Therapy, Secretary of the Council on Pharmacy and Chemistry and Director of the Chemical Laboratory. His service to the Association extended over a period of twenty-eight years. Dr. Leech was a faithful and efficient member of the administrative personnel of the American Medical Association and made perhaps as great a contribution to the development of rational therapy as has been made by any other individual. That the value of his services was most gratefully appreciated by practically all of those who knew of the nature of his work and of his great contributions to the cause he so long served was clearly shown by the receipt of a large number of messages of condolence from all parts of the United States.

Income and Expenditures

Gross income from all sources for the year ended Dec. 31, 1940 amounted to \$1,876,353.80, an increase of \$77,586.98 over that of the previous year. Total expense for the year 1940 was \$1,688,585.50, an increase of \$4,617.45 over expense incurred in 1939.

Income received from Fellowship dues and subscriptions totaled \$776,202.44 in 1940 as compared with \$751,882.02 in 1939. Receipts from the sale of advertising space amounted to \$969,581.25, representing an increase of \$60,790.67 over the preceding year. Other items of income, including tax refunds and receipts from the sale of reprints and books, amounted to \$49,998.20 in 1940.

Interest received on investments in 1940 amounted to \$80,571.91, as compared with \$84,938.91 in the previous year, or a decrease of \$4,367. This reduction emphasizes the difficulty of investing the funds of the Association profitably and safely. Bonds matured, sold or called during the year totaled \$276,959.38. Others were purchased at a cost of \$245,593.75. The face value of defaulted bonds owned by the Association on Dec. 31, 1940 is the same as a year ago, none of the defaulted issues having been sold and there having been no further defaults. The face value of defaulted bonds amounts to \$48,400 and the accumulated unpaid interest on them \$5,530.10.

The cost of paper used in the publication of THE JOURNAL in 1940 was \$230,775.35, representing an increase of approximately \$1,400 over the amount expended in the previous year.

The sum of \$3,091.61, representing a contribution of the Association toward the expense of group hospital insurance carried

for the benefit of employees, who share the premiums, was expended during the year. The group hospital insurance policies held by the Association's employees have been in force since March 5, 1940, and the reaction of the employees seems very favorable.

Expenditures incident to the operation of the various councils, bureaus and departments of the Association in 1940 amounted to \$482,510.35 as compared with \$484,052.06 in 1939 and \$458,499.27 in 1938. Although expense incurred by the Bureau of Exhibits was reduced in 1940 by the sum of \$25,531.91 as the result of the discontinuance of Association exhibits at world's fairs, this reduction was offset by expenditures on account of the work of the Committee on Medical Preparedness, which amounted to \$27,238.97.

The publication in 1940 of the QUARTERLY CUMULATIVE INDEX MEDICUS and of the special journals resulted in a net loss of \$71,091.02, more than half of which was represented by the cost of publication of the QUARTERLY CUMULATIVE INDEX MEDICUS. Three of the special journals, the AMERICAN JOURNAL OF DISEASES OF CHILDREN, the ARCHIVES OF OTOLARYNGOLOGY and the ARCHIVES OF OPHTHALMOLOGY, produced income larger than the cost of publication in 1940. HYGIEIA reduced its loss from \$7,669.85 in 1939 to \$2,132.38 in 1940.

A biennial comparison of results from the publication of the American Medical Directory indicates a loss on the Sixteenth Edition, completed on May 31, 1940, of \$8,939.26, as compared with \$8,488.90 on the Fifteenth Edition, published in 1938.

Expenditures for legal services and investigations during 1940 amounted to \$112,345.16, a sum slightly less than that expended for the same purpose in the preceding year.

The building and equipment of the Association have been well maintained. Building expense of \$37,333.56 shows a decline of \$5,337.62 from the previous year. Depreciations in plant and in equipment chargeable to Journal Operating Expense totaled \$36,785.30 in 1940 as compared with \$31,461.19 in 1939. Late in 1940, in order to effect economies in certain printing operations, the Association contracted for the immediate installation of two new two-color presses, each of which will cost approximately \$21,000.

The number of persons in the employ of the Association at the time of preparation of this report was six hundred and thirty-six. There appears to be a trend toward higher wages in the office group as well as in the organized group of employees.

Net income for the year ended Dec. 31, 1940, as shown in the report of the Auditor, amounted to \$187,768.30, including interest of \$80,571.91 from investments.

The Report of the Treasurer and the Report of the Auditor are submitted as a part of the official report of the Board of Trustees.

Summary

Gross income from all sources for the year 1940 was \$1,876,353.80. Income received from Fellowship dues and subscriptions was \$776,202.44, exceeding income from the same source in 1939 by the sum of \$24,320.42. Income from the sale of advertising space amounted to \$969,581.25, an increase over 1939 of \$60,790.67. Interest received on investments amounted to \$80,571.91, which was \$4,367 less than in 1939. Bonds matured, sold or called during the year amounted to \$276,959.38, and bonds were purchased at cost in the sum of \$245,593.75. The face value of defaulted bonds amounts to \$48,400, the same as in 1939; the accumulated unpaid interest is now \$5,530.10. The cost of paper used in the publication of The Journal was approximately \$1,500 greater in 1940 than in 1939. Expenditures on account of the various councils, bureaus and departments of the Association, including the newly established Committee on Medical Preparedness, were \$482,510.35 as compared with \$484,052.06 in 1939. Miscellaneous expenses, including fees for legal services and investigations and losses involved in sundry publications, amounted to \$194,507.82. The number of persons employed by the Association at the time of preparation of this report was six hundred and thirty-six. Net income for the year as shown in the Report of the Auditor was \$187,768.30, of which \$80,571.91 represented interest on investments.

The Journal of the American Medical Association

THE JOURNAL has continued to occupy the high place which it holds in medical journalism and is now universally recognized as a leader in its field. During the year modifications were made in the cover of the periodical and there was also some rearrangement of the contents. These changes were necessitated by exigencies relating to more efficient use of the presses. The increase in circulation made necessary some advancement in the

time of going to press. Nevertheless, the changes have resulted in what is widely accepted as a total improvement in the presentation of the material. The changes have also permitted the use of color on the cover.

A most significant development in THE JOURNAL during the past year has been the addition of a section devoted to medical preparedness. Here are published announcements coming from the Army, the Navy and the United States Public Health Service as well as orders to physicians who are taken into the service of the Army and Navy. The publication of this section of THE JOURNAL has served to produce cooperation and coordination among those interested in medical preparedness.

A special series of articles devoted to glandular physiology and therapy and to the therapy of the Cook County Hospital, and a special series of contributions from the general scientific meetings at the annual session have been exceedingly valuable in presenting modern medical technic to great numbers of physicians.

The expansion of the Association with the creation of new councils, committees and bureaus has placed a special responsibility on THE JOURNAL for the issuance of reports. Thus there are now special issues devoted to hospitals, to medical education, to licensure, to industrial health and to the proceedings of the official bodies of the Association. There are also extended reports from the Council on Pharmacy and Chemistry, the Council on Physical Therapy, the Council on Foods and Nutrition, the Committee on American Health Resorts and the Committee to Study Air Conditioning.

The European war has interfered seriously with the receipt of letters from foreign countries. THE JOURNAL continues to receive letters at fairly regular intervals from London. An occasional contribution is received from France. Letters from Vienna, Budapest, Bucharest, Moscow and Oslo have been almost entirely discontinued. An attempt is now being made to secure more frequent contributions from Buenos Aires, Rio

during recent months to utilize to greater advantage the periodicals from Japan.

The net paid weekly average circulation of THE JOURNAL in 1940 was 98,002.

The first of the accompanying tables indicates the number of Fellows and subscribers on the mailing list of THE JOURNAL in each state and territory on Jan. 1, 1941. This table also shows the number of Fellows and subscribers in other countries, the number of copies of THE JOURNAL sent to advertisers and subscription agents and the number sent as exchange or complimentary copies. Table 2 shows the number of physicians in each state as indicated by the Sixteenth Edition of the American Medical Directory, the number of physicians in each state who receive THE JOURNAL and the approximate percentage of such physicians.

Summary

The Journal has continued to occupy its recognized high place as a leader in the field of medical journalism. Changes in the composition of The Journal made during 1940 have resulted in what has been widely accepted as a total improvement.

A section devoted to medical preparedness was added to The Journal in 1940 and has been of great service in furthering cooperation and coordination among those interested in medical preparedness.

The presentation of modern medical technic by means of special series of articles devoted to various subjects has been exceedingly valuable to great numbers of physicians. Special issues of The Journal during the year have been devoted to hospitals, medical education, licensure, industrial health and reports of official bodies of the Association, and extended reports of councils and committees of the Association have been published.

The European war has interfered seriously with the receipt of foreign letters and periodicals, and an attempt is now being made to secure more frequent contributions from South American centers and to utilize to greater advantage periodicals received from Japan.

The net paid weekly average circulation of The Journal in 1940 was 98,002.

Press Relations

During 1940 there was developed among the various mediums of public information, under the supervision of the Editor of THE JOURNAL, a wider acceptance of the American Medical Association as a source of information regarding all phases of medicine than ever before in the history of the Association. In 1940 more than seventy-eight thousand newspaper stories based on articles in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and in HYGIEA appeared in the daily press of the United States. This total does not include feature stories and editorials in daily newspapers pertaining to information published by the Association, the number of which is constantly increasing. These newspaper stories are furnished the press through the AMERICAN MEDICAL ASSOCIATION NEWS, a weekly publication containing abstracts of articles appearing in the various periodicals of the Association. The mailing list of this publication includes three hundred and twenty-five daily newspapers, seventy-seven news services, radio stations and miscellaneous publications, forty local and state health departments, fifty-one nongovernmental health and tuberculosis associations, eighty-two county and local medical societies, eighty-seven national medical organizations, twenty-eight science writers, sixty pharmaceutical associations and manufacturing companies, forty-five industrial organizations and seventeen educational institutions. In addition, eighty-six copies are sent weekly to various constituent state and territorial medical associations, some of which receive several extra copies for distribution to the smaller newspapers in their states. All names on the mailing list of the AMERICAN MEDICAL ASSOCIATION NEWS have been placed there by request. No charge is made for the publication. Of particular importance in 1940 was the increased use of information from the Association, particularly from the AMERICAN MEDICAL ASSOCIATION NEWS, by radio stations in news broadcasts. The number of stations using information furnished by the Association is constantly increasing.

Copies to physicians in the United States Army, Navy and Public Health Service are not included.

de Janeiro and other South American centers of medical information.

The war has also interfered with the receipt of foreign periodicals, many of which have been discontinued. Practically no medical literature is received from France. The German publications come irregularly and are of an entirely different order from that which prevailed previously. Some British publications have discontinued their appearance and all others are smaller in size and in scientific content. An arrangement has been made

The efficiency of the press arrangements for the annual sessions of the Association, which are carried on under the direct supervision of the Editor of THE JOURNAL, and the increasing recognition of the importance of the Association's activities were ably demonstrated at its Ninety-First Annual Session in New York. Despite the declaration of war on Great Britain by Italy on the first morning of the session, the major daily newspapers in New York City carried a total of 274¾ inches or approximately 22,000 words regarding the Association in editions of that day. During the five days of the session, despite the space demands of news from Europe, the eight major New York City newspapers devoted a total of 1,573½ inches of space to the session, which equalled more than 125,000 words. An almost equal number of words was telegraphed by wire services or special staff writers to other newspapers throughout the country during those five days.

The number of inquiries regarding all phases of medicine received by the Association from newspapers in 1940 exceeded two thousand, as compared with approximately one thousand four hundred inquiries received in 1939. These ranged from interviews by reporters at the headquarters office to telegrams and local and long distance telephone calls.

The increasing confidence of the various mediums of public information in the Association is reflected in the number of such agencies that are depending on the Association for guidance on the medical stories used.

Other activities also have expanded, particularly with respect to articles and information furnished industrial house organs and medical supplements published by local newspapers under the sponsorship of local medical societies. The number of such newspaper supplements aided by this department increased from fifteen in 1939 to twenty-one in 1940. The department has been of increasing assistance to state and county medical societies in their press relations programs. The press facilities for such special meetings sponsored by the Association as the Annual Congress on Medical Education and Licensure and the Annual Congress on Industrial Health also are handled by this department, which also furnishes the material for the Medical News page appearing in HYGEIA each month.

In addition to the regular channels of public information established and maintained by the department, an increasing number of special releases regarding the various phases of medical preparedness which clear through the Association are being made to the press and to radio stations.

Special Journals

The special journals published by the Association have been continued with the high scientific and editorial standards established for them. The number of pages in the periodicals was increased, as shown in an accompanying table, in order to handle the volume of material accepted for publication by the editorial boards.

A special issue of the ARCHIVES OF SURGERY was published in August in honor of Dr. Dean Lewis, of the ARCHIVES OF PATHOLOGY in July in honor of Dr. S. B. Wolbach, and of the ARCHIVES OF OPHTHALMOLOGY in July in honor of Dr. Frederick H. Verhoeff. The editorial board of the ARCHIVES OF SURGERY arranged for special symposiums on peripheral vascular disease, intervertebral disks, compound fractures, preoperative and post-operative care and the esophagus, which have attracted considerable interest. These account, in part at least, for the increase of three hundred and forty-four in the number of subscribers to that periodical. The ARCHIVES OF INTERNAL MEDICINE made the largest gain in number of subscribers for the year, the result, no doubt, of the continuation of the publication of specially prepared reviews of the literature in various fields of internal medicine.

Requests are still being received for cumulated indexes of some of the special journals; thus far a sufficient number has not been received for any index to warrant its publication.

Only two changes were made in the membership of the editorial boards: Dr. John Whitehorn of St. Louis was elected to succeed Dr. H. Douglas Singer, deceased, on the editorial board of the ARCHIVES OF NEUROLOGY AND PSYCHIATRY, and Dr. David G. Cogan of Boston to succeed Dr. J. H. Waite, resigned,

on the editorial board of the ARCHIVES OF PATHOLOGY. Dr. J. Mackenzie Brown of Los Angeles was elected as an additional member of the editorial board of the ARCHIVES OF OTOLARYNGOLOGY and Dr. Tracy J. Putnam, chief editor of the ARCHIVES OF NEUROLOGY AND PSYCHIATRY.

The Board of Trustees takes pleasure in reporting to the House of Delegates that each of the eight special journals pub-

Number of Pages in Special Journals for 1940 and 1939

Archives of Ophthalmology.....	3,598	3,753	155

lished by the Association showed an increase in circulation in 1940, varying from forty-five for the ARCHIVES OF PATHOLOGY to four hundred and thirty-one for the ARCHIVES OF INTERNAL MEDICINE. The circulation of these periodicals in 1939 and 1940 is presented in the appended table.

Summary

The special journals published by the Association have continued to follow the high scientific and editorial standards previously established.

Special issues of the Archives of Surgery, the Archives of Pathology and the Archives of Ophthalmology were published during the year, and the number of pages in these and others of the special periodicals was considerably increased. There was a gratifying increase in 1940 in the number of subscribers to each of the special journals.

War Medicine

In cooperation with the Division of Medical Sciences of the National Research Council, the American Medical Association began publication in January 1941 of a new periodical called WAR MEDICINE. Its editorial board is the Committee on Information of the National Research Council, of which Dr. Morris Fishbein is chairman. There are cooperating editorial associates from the United States Army and Navy Medical Corps and from the United States Public Health Service.

The Board of Trustees authorized publication of this periodical as a bimonthly, but there are indications that it may be desirable after the first year to make it a monthly publication.

Through WAR MEDICINE there are made available the official reports of the various committees of the Division of Medical Sciences of the National Research Council, also official circulars of the United States Army and Navy. The periodical is also reflecting the advances in the coordination of efforts for improved nutrition and has had official reports and contributions on this subject.

Its abstracts have constituted an especially useful contribution, and there are also being published a series of collective reviews on subjects of training in military medicine. The publication has had most favorable comment from leaders in British and Canadian military medical affairs. This periodical represents a notable contribution by the American Medical Association to national defense.

Library

The Library of the American Medical Association maintains a package library service, a periodical lending service and an employees' lending library, records all books received and reviewed for *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*, provides a general reference service, prepares and edits the index for *THE JOURNAL* and prepares material for the *QUARTERLY CUMULATIVE INDEX MEDICUS*.

In 1940, 3,052 package libraries were distributed in response to requests received from all the states and the District of Columbia. The subjects most frequently requested concerned sulfanilamide, tuberculosis, vitamins, anesthesia, mental diseases, syphilis, arthritis, hypertension, diabetes mellitus and aviation medicine. One hundred and seventeen government hospitals and agencies were supplied through the package library service.

Periodicals lent in 1940 numbered 13,265, the highest figure reported since the periodical lending service was established. The library service was used to a greater extent by physicians of Illinois, New York, Pennsylvania, Ohio and Tennessee than by those of other states. Approximately 5,500 miscellaneous reference questions were answered by the Library. Although most of the library reference work is conducted by mail, 1,048 visitors called at the Library for service during 1940.

The second edition of "Subject Headings and Cross References to the Quarterly Cumulative Index Medicus" was published in 1940. The first edition appeared in 1931. This publication was compiled primarily as a guide for the indexing staff of the *QUARTERLY CUMULATIVE INDEX MEDICUS*. Requests for copies were soon forthcoming from other libraries, and this interest prompted the publication of a second edition. While there is a limited demand for this publication, nearly one third of the total number printed was disposed of in a relatively short time. This book is used as an aid to librarians in the classification of medical periodical material for reprint collections or as a guide to the indexing of medical periodicals.

The Employees' Library makes books available to employees of the American Medical Association who pay an annual fee of 50 cents for the service. The circulation of books during the year was 5,028, and the employee subscribers numbered 122. The magazine circulation totaled 2,560.

THE EFFECTS OF WAR ON SCIENTIFIC PUBLICATIONS

The *QUARTERLY CUMULATIVE INDEX MEDICUS* was affected somewhat in 1940 by the war. The January to June 1940 issue, volume 27, contained 15,750 articles from periodicals published in various foreign languages. No count is kept of articles published in English. In volume 28, July to December 1940, there was a noticeable decrease in the number of articles included from the foreign language periodicals. Only 10,864 articles were indexed in this volume, a decrease of 4,886 articles. This situation is due primarily to the nonreceipt of many foreign periodicals, chiefly French and Italian, and to the decrease in size of foreign periodicals, due no doubt to shortage of paper. As noted in *THE JOURNAL*, Aug. 24, 1940, there was a period of several months when no journals were received from Germany. In late September, however, the receipt of German periodicals again became quite regular. During 1940, forty-six periodicals were dropped because of suspended publication, and sixty-eight periodicals were added to the "List of Periodicals Included in the Quarterly Cumulative Index Medicus." In the past year one hundred and seven exchanges were canceled, sixty-five because of war conditions and forty-two because of other circumstances, such as suspension of publication, nonreceipt and irregular receipt.

Summary

The Library of the American Medical Association maintains a package library service, a periodical lending service and an employees' lending library, records all

books received and reviewed for *The Journal*, provides a general reference service, prepares and edits the index for *The Journal* and prepares material for the *Quarterly Cumulative Index Medicus*.

In 1940, 3,052 package libraries were distributed in response to requests coming from every state, 13,265 periodicals were lent, approximately 5,500 miscellaneous reference questions were answered, 1,048 visitors to the Library requesting service were accommodated and 5,028 books were circulated from the employees' lending library. A second edition of the booklet "Subject Headings and Cross References to the Quarterly Cumulative Index Medicus," prepared in the Library, was published.

The war in Europe affected somewhat the *Quarterly Cumulative Index Medicus*, which is prepared for publication in the Library. Many foreign periodicals, chiefly French and Italian, have not been received, the size of foreign journals has been reduced and, for a period of several months during the year, no journals were received from Germany, so that there was a notable decrease in the number of articles indexed from foreign periodicals.

Hygeia

The circulation of *HYGEIA* has been maintained constantly, and from an editorial point of view this publication continues to hold the high place that it has had in recent years. Many of its articles are selected for republication in such periodicals as the *Reader's Digest*. Many hundreds of thousands of reprints have been made from the pages of *HYGEIA* in publications circulated by manufacturing, industrial, railroad and similar organizations. It is used in many schools as a reference work and as a guide for students.

The series of picture presentations particularly related to national defense have attracted nationwide attention and have also been utilized by the military service. Special attention has been paid to nutrition, and a section of the periodical is regularly devoted to reports of the Council on Foods and Nutrition of the American Medical Association. The correspondence with readers of *HYGEIA* who are in search of suggestions for the prevention of disease and of a guide to the securing of proper treatment is a further indication of its immense usefulness.

Reprints from this publication are widely circulated by the Bureau of Health Education of the American Medical Association. Moreover, *HYGEIA* serves to promote a wider audience for radio programs prepared by this bureau.

Advertising in *HYGEIA* has shown a gratifying increase in the year covered by this report.

The average monthly net paid circulation was practically the same in 1940 as in 1939.

The loss on this publication in 1940 was less than that sustained in 1939 by the sum of \$5,537.47. Total income was larger than in the preceding year by the sum of \$18,393.23.

Summary

From an editorial point of view *Hygeia* continues to hold its usual high place, and its circulation has been well maintained. Many *Hygeia* articles have been selected for republication in such periodicals as the *Reader's Digest*, and the magazine is used in many schools as a reference work and guide for students. During the year a series of picture presentations related to national defense attracted nationwide attention. Reports of the Council on Foods and Nutrition of the American Medical Association appear regularly in *Hygeia*. Reprints from this publication are widely circulated by the Bureau of Health Education.

The average monthly net paid circulation of *Hygeia* during 1940 was practically the same as in 1939. There was a gratifying increase in the amount of advertising in *Hygeia* in 1940, and the loss sustained through its publication was \$5,537.47 less than in 1939. The total income in 1940 was larger than in the preceding year by the sum of \$18,393.23.

American Medical Directory

The Sixteenth Edition of the American Medical Directory was completed on May 31, 1940. The new Directory contains 195,104 names, as compared with 188,916 in the previous edition, and there are 126 more pages.

The publication costs of the Sixteenth Edition amounted to \$173,869.99, approximately \$8,000 more than the cost of publication of the 1938 Directory. The net loss on the current edition amounted to \$8,939.26, as compared to the loss of \$8,488.90 incurred in the publication of the Fifteenth Edition.

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau, which is operated for the benefit of official organs of constituent state medical associations, represented thirty-four such publications in 1940. Although the *New York State Journal of Medicine* withdrew from the Bureau on Dec. 31, 1939, after a year's membership, the number of journals represented remained the same as in the previous year since the newly established *North Carolina Medical Journal* became a participant in January 1940.

Commissions earned by the Bureau in 1940 amounted to \$40,007.79, of which \$20,000 was remitted at the end of the year to the state medical journals represented. These remittances are made in proportion to the total amount of advertising secured for each of the journals. The operating costs of the Cooperative Medical Advertising Bureau in 1940 amounted to \$18,425.58, while cash discounts allowed in excess of cash discounts received amounted to \$1,582.21.

Mailing and Order Department

During 1940 the total number of pieces of first and third class mail handled through the Mailing Department, exclusive of publications of the Association sent to subscribers, was 2,243,021, and more than 3,800,000 envelopes of various sorts were required for all mailing purposes.

The Order Department during the year covered by this report handled 74,866 separate orders, which involved the distribution of nearly 400,000 units and the handling of 6,647 bags of mail.

Division of Drugs, Foods and Physical Therapy

Paul Nicholas Leech, Ph.D., Director of the Division of Foods, Drugs and Physical Therapy, died suddenly Jan. 14, 1941. In 1913 Dr. Leech joined the staff of the American Medical Association as a chemist and in 1923 became director of the Chemical Laboratory, working under Prof. W. A. Puckner, who was the Secretary of the Council on Pharmacy and Chemistry. Following the death of Professor Puckner in 1932 Dr. Leech became Secretary of the Council on Pharmacy and Chemistry, and when the Board of Trustees created the Division of Foods, Drugs and Physical Therapy he was appointed Director. For more than a quarter of a century Dr. Leech rendered devoted service in the cause of scientific medicine and earned for himself a nationwide reputation for integrity, scientific judgment and unswerving devotion to the highest ideals.

The Division of Drugs, Foods and Physical Therapy coordinates the work of the Council on Pharmacy and Chemistry, the Council on Foods and Nutrition and the Council on Physical Therapy, each Council functioning independently but receiving the mutual benefit of the coordination.

COUNCIL ON PHARMACY AND CHEMISTRY

During 1940 the demands made on the Council on Pharmacy and Chemistry have severely taxed its facilities. The Council, by giving prompt consideration to the evidence in support of new chemotherapeutic agents that have been produced, has attempted to cooperate to the fullest possible extent with the United States Food and Drug Administration, which is charged with rendering decisions under the Food, Drug and Cosmetics Act. Among important reports prepared by the Council were those dealing with the therapeutic value of sulfathiazole and sulfamethylthiazole, two derivatives of sulfanilamide. Other

informative reports have dealt with vitamins, hormones and surveys of drug therapy. These reports provide a consensus of expert medical opinion, and thus the decisions of the Council have been designed to aid physicians, manufacturers and government officials in consideration of the value of therapeutic agents. The value of the compilation and publication of expert medical opinion, a feature common to the work of all three councils of the Division of Drugs, Foods and Physical Therapy, warrants continued and expanded support of these councils by the medical profession.

REPORTS OF THE COUNCIL

The reports of the Council on Pharmacy and Chemistry reflect the varied activities of the Council on questions of timely therapeutic importance. The chemotherapy of syphilis has received impetus in a new direction by the introduction of the massive dose intravenous drip method. While this procedure appears to offer great possibilities in the treatment of early syphilis, some toxic reactions have been reported and the Council considers that further experimental studies of this form of therapy are needed and should be undertaken by those who have adequate facilities for conducting such investigations. In a preliminary report on acetylglycysarcosine, the Council pointed out that an efficient, painless arsenical for intramuscular use in the treatment of syphilis is of recognized value, but, again, further work needs to be done to define the usefulness of this preparation.

An interesting development in therapy is evidenced by the work on snake venoms. In a report on solutions of cobra venom the Council has noted that this preparation is capable of relieving pain, especially in cancer, but often fails completely and seldom can replace morphine entirely for any considerable time. Special care may be necessary in the administration of this preparation to patients with psychic disturbances or diseases of the liver or kidneys. The Council has also adopted a conservative view regarding the claims for solutions of moccasin venom and has expressed willingness to consider new evidence of its value in the treatment of hemorrhagic conditions when such evidence becomes available.

Within limitations, therapy with chorionic gonadotropin is of definite value, but in the opinion of the Council the efficacy of this preparation in the treatment of uterine bleeding and of male hypogonadism remains to be demonstrated.

Another report calls attention to dangers in the use of desoxycorticosterone in the treatment of Addison's disease, while still another reviews the reports of experiments on the use of lipocain, a pancreatic hormone concerned in the normal transport and utilization of fat.

At the request of the Board of Trustees, the Council has obtained further data on the promiscuous use of barbiturates. Dr. W. E. Hamburger has collated data on barbiturate poisoning in patients admitted to a number of hospitals during the decade 1928 to 1937. It has been found that, out of approximately 1,250,000 patients admitted to the hospitals reporting, there have been recorded 643 cases of acute barbiturate poisoning. Addiction to barbiturates is considered to be common, and the promiscuous use of these preparations is clearly responsible for many accidental intoxications that have produced fatal results.

Among other reports published by the Council in 1940 are discussions of progress in the use of histaminase in allergic manifestations, the possible value of phenothiazine as a parasiticide and antibacterial agent, the present status of the injection treatment of hernia and the limitations and advantages of organic mercurial compounds as bactericidal agents. The Council considers it desirable to control bromide therapy by analysis of the blood to determine that the bromide concentration does not rise above a safe therapeutic concentration of from 125 to 150 mg. to each 100 cc. of blood. The hazards of uncontrolled use of bromides by the general public is apparent. There are also reports on the use of guanidine hydrochloride in the treatment of myasthenia gravis and of calcium mandelate, which has been introduced as a form of mandelic acid therapy for the treatment of urinary infections. In discussions of the use of oxygen and carbon dioxide mixtures, the Council has directed attention to the need for caution in the treatment of dyspneic patients with tracheal obstruction. Dr. Paul R. Cannon reviewed for the Council the problem of lipid pneumonia which may occur

whenever exogenous lipids enter the pulmonary tissues and remain there long enough to cause irritation. Special attention has been given in the report to the methods of prevention.

A much quoted article has been the report on the treatment of habitual abortion with vitamin E. The evidence on the value of vitamin E preparations is conflicting, but some of the published results are sufficiently encouraging to justify further clinical experiment, provided preparations of vitamin E of known activity are used and provided adequate diagnosis and clinical control can be established.

As a result of consultations with representatives of other organizations, the Council has decided on the names pyridoxine and pyridoxine hydrochloride as designations for products formerly known as vitamin B₆ and vitamin B₆ hydrochloride. Late in the year there was held a meeting of the Cooperative Committee on Vitamins attended by members of the Council on Pharmacy and Chemistry, of the Council on Foods and Nutrition and several invited guests. As a result of these deliberations, it is anticipated that there will be extensive revision of the allowable claims for vitamins, which will be published in New and Nonofficial Remedies.

PUBLICATIONS OF THE COUNCIL

New and Nonofficial Remedies: This book, which is revised each year, contains the official list of products submitted and accepted for inclusion. More than five thousand copies were sold during 1940, and an equal number of copies in paper bound form have been distributed without cost to the members of the senior class of each recognized medical school. Extensive revisions are contemplated for the 1941 edition, particularly in the sections dealing with serums and vaccines and vitamin preparations.

Epitome of the U. S. Pharmacopeia and National Formulary: The revision of this volume, made necessary by the issuance of the second supplement of the U. S. Pharmacopeia XI, has been completed. The total sales of this book for the year number more than three thousand five hundred.

Useful Drugs: Because of a shortage in the number of available copies of this important publication of the Council, more than six thousand five hundred copies of which were distributed during the year, a new edition had to be prepared, approximately three thousand copies of which were sent out on request during the month of October.

Glandular Physiology and Therapy: A new series of articles on the endocrines is being published in THE JOURNAL, and the compilation of these articles in book form will probably be completed during 1941. It is apparent that advances in the endocrine field have occurred so rapidly that it is difficult even for those thoroughly familiar with the subject to keep up with these advances. This new series should be useful as a much needed review of recent developments.

A. M. A. Interns' Manual: This publication, prepared through the cooperation of the Council on Pharmacy and Chemistry and other councils and departments of the Association, has been well received but is now in need of revision. It is expected that a new edition of the book will be completed by June 1941, its editing, as well as that of several other special publications of the Council, being largely in the hands of Dr. Paul C. Barton, Director of the Bureau of Investigation, with the collaboration and supervision of members of the Council.

CHANGES IN MEMBERSHIP

During the year Dr. Ernest E. Irons, a member of the Council on Pharmacy and Chemistry for eighteen years, resigned because of his appointment as a member of the Board of Trustees, and Dr. Soma Weiss of Boston was elected to fill the unexpired term of Dr. Irons.

Summary

During the year the Council on Pharmacy and Chemistry has continued to give consideration to questions of timely therapeutic importance. Reports have been published on various questions dealing with chemotherapeutic agents, vitamins and hormones. Among the important reports issued by the Council have been discussions of the massive dose intravenous drip method in the treat-

ment of syphilis, a review of the status of therapy with snake venoms, and the evaluation of products such as chorionic gonadotropin, desoxycorticosterone and vitamin E. Informative reviews have been published on the promiscuous use of barbiturates and bromides, the use of histaminase in allergic conditions, the problem of lipid pneumonia and the therapeutic value of oxygen-carbon dioxide mixtures.

The Council has undertaken extensive revisions of its official publication, New and Nonofficial Remedies, in order to take care of newer developments in therapy. New editions of the Epitome of the U. S. Pharmacopeia and National Formulary and of Useful Drugs were prepared and published.

Under the sponsorship of the Council, a new series of articles on the endocrines was planned and publication in The Journal has begun. When completed, it is planned to publish this series in book form as a new edition of Glandular Physiology and Therapy.

COUNCIL ON FOODS AND NUTRITION

Because of increased emphasis on the educational aspects of its activities and by authorization of the Board of Trustees, the name of the Council on Foods was changed in 1940 to the Council on Foods and Nutrition. The medical profession, the manufacturers of food products and the public are looking to the Council more and more for expressions of authoritative opinion on new developments in the fields of food and nutrition. There now is under way a plan of revising the scope of the work of the Council so that particular attention may be directed to foods intended especially for infants, for the sick and for special dietary purposes. Special attention also needs to be given to those food products which have been manufactured in ways intended to enhance their nutritive properties.

FORTIFICATION OF FOODS

The national defense program has given impetus to the development of nutritionally improved foods, and the policies enunciated by the Council on previous occasions have done much to guide this development along proper channels.

Members of the Council on Foods and Nutrition have been active participants in the work of the Subcommittee on Medical Nutrition of the National Research Council and also of a nutrition committee under the auspices of the Federal Security Agency. An important question given consideration by each of these committees as well as by the Council pertains to the improvement of white flour. A detailed report on the nutritional enrichment of flour and other cereal products is being prepared for publication so that the medical profession may be kept informed of developments in this important field.

COOPERATIVE COMMITTEE ON VITAMINS

Members of the Council on Foods and Nutrition and of the Council on Pharmacy and Chemistry as well as distinguished invited guests attended a meeting of the Cooperative Committee on Vitamins, at which problems in this field were discussed. The Cooperative Committee decided that there is insufficient evidence to warrant approval of a proposal to add carotene to milk, and that, because milk with 400 U. S. P. units of vitamin D to the quart, when ingested in the customary amounts fed to infants, will provide sufficient vitamin D to prevent rickets and to promote optimal growth and tooth development, milk with greater amounts of vitamin D would not be acceptable.

The Council considers it desirable to encourage more research on the vitamin content of foods. Recent investigations have called attention to the liberal quantities of certain members of the vitamin B complex in meat, notably thiamine, riboflavin and nicotinic acid. Other investigations have shown peanuts to be a significant source of vitamin B₁.

REPORTS AND PUBLICATIONS OF THE COUNCIL

Among the reports of general interest sponsored by the Council during the year is an informative article, prepared by the late Dr. Mary Swartz Rose, on the effect of quick freezing on the nutritive value of foods. The Council finds from its review

that the vitamins and other nutritive essentials of foods are well preserved by this process although there may be considerable loss of thiamine in the blanching of certain vegetables preparatory to freezing the products.

The study of the significance of lead in foods has been continued, and a report emphasizing the value of calcium in the diet in preventing the storage of lead in the body has been published. On the basis of available evidence, the Council has not considered it advisable to change the tolerance for toxic spray residues on accepted products.

The book *Accepted Foods and Their Nutritional Significance* is the official publication of the Council on Foods and Nutrition. It not only contains descriptions of accepted products but also provides an account of Council decisions on many general topics in nutrition. More than two thousand six hundred copies of this book have been distributed.

Each month during the year there has been published in *HYGEIA* an article on foods and nutrition prepared in the office of the Council and based on Council opinion.

DECISIONS OF THE COUNCIL

The Council has voted to accept salt containing 0.01 per cent iodide—approximately one-half the previous amount—provided suitable evidence is made available that the iodide content is stabilized at this level and provided also that manufacturers are using improved methods for the uniform distribution of iodide throughout the salt.

Other questions given consideration by the Council have dealt with the informative labeling of chopped foods intended for the feeding of infants and young children and with what constitutes suitable desserts for children.

COUNCIL CONSULTANTS

The following persons were among those called on as consultants during the year, and their services are gratefully acknowledged: Drs. Adam S. Christman, Kate Daum, Arild E. Hansen and Genevieve Stearns and Miss Mary A. Foley. At the meeting of the Cooperative Committee on vitamins, the following distinguished guests were present: Drs. C. A. Elvehjem, Paul E. Howe, C. G. King, T. G. Klumpp, William H. Sebrell Jr. and Albert Snell. All of the gentlemen contributed to the discussions.

Summary

During the year the name of the Council on Foods was changed by authority of the Board of Trustees to "Council on Foods and Nutrition" in recognition of the direction which the work of the Council is taking. While attention is being directed to broad nutritional problems, the Council continues to give consideration to individual food products. The scope of the Council's work gradually is being revised to permit emphasis on items which present special problems, such as foods intended for the feeding of infants, products for feeding the sick and preparations for special dietary purposes.

Members of the Council have rendered helpful service to governmental and other agencies concerned with problems of nutrition, an important development being the nutritional improvement of white flour and ordinary bread whereby these foods will provide more of the important vitamins and minerals found in wheat grain. It is worthy of note that this program is in essential harmony with the basic principles of the Council regarding the fortification of foods.

Vitamins have continued to receive particular consideration by the Council, especially questions relating to vitamin D milk. The opinion was reached that vitamin D milk need not contain more than 400 U. S. P. units of vitamin D to the quart, because this amount is satisfactory for all known nutritional requirements and because there is little evidence that more vitamin D is of benefit. The Council considers it desirable to encourage more research on the vitamin content of foods, especially of those that are readily obtainable for persons of limited income.

Among the problems given consideration by the Council have been the effect of quick freezing on the nutritive value of foods, suitable tolerances for toxic spray residues on certain foods and the proper amount of iodine in iodized salt.

A number of reports of the Council have been published in *The Journal*, and each month an article on foods or nutrition has been published in *Hygeia*.

COUNCIL ON PHYSICAL THERAPY

The Council on Physical Therapy has continued its investigations of physical therapy apparatus and methods and its issuance of reports based on such investigations. It has endeavored to promote the use of sound physical therapeutic measures and to encourage research in the field of physical therapy. The Council has also attempted to gather and to disseminate information that will be helpful to physicians in determining the therapeutic value of devices and methods represented for use in physical therapy.

Important activities of the Council during the last year included the consideration of various types of physical therapy apparatus, the promotion of education and the active participation with other agencies in aiding medical preparedness. Members of the Council are serving on the Subcommittee on Physical Therapy of the National Research Council in connection with the development of the national defense program.

RADIO INTERFERENCE

For several years the Council has been concerned with the problem of interference with radio reception resulting from the use of diathermy apparatus. Several solutions such as the screening of treatment rooms and frequency allocation have been suggested. It now appears that frequency allocation will be the most satisfactory plan. At a recent conference held by the Federal Communications Commission at which the medical profession was represented by members of the Council, a spokesman for manufacturers of electromedical equipment asked that sixty channels in all be allocated on which to operate diathermy equipment. The Commission felt that this request required the setting aside of too many valuable channels of communication and urged that apparatus be manufactured which would operate on one channel without extensive deviation. The Council voiced its disapproval of any requirements which may lead to excessive increase in the cost of electromedical equipment and hence in the cost of diathermy treatments. No final agreement was reached, and future conferences will be held to study the problem.

INVESTIGATION OF APPARATUS

In the consideration of apparatus it has been necessary in many instances to reinvestigate and reconsider submitted appliances before publishing final reports. Reports on sixty-eight pieces of apparatus were published in *THE JOURNAL* during 1940.

The booklet "Apparatus Accepted," in which are described briefly the devices on the Council's accepted list, was revised during the year. This booklet is widely distributed, and the increased demand for it indicates that many physicians find it a valuable aid in the selection of apparatus.

EDUCATION IN PHYSICAL THERAPY

The group of consultants on education who aid the Council's Committee on Education in acquainting the medical profession as to the benefits obtained from sound physical therapeutic methods has been enlarged and now consists of twelve members. This subcommittee of the Council has carried on an active program of education by means of lectures, exhibits, addresses before medical audiences and the writing of informative articles. The Council notes with gratification the increased number of courses in physical therapy being given in medical schools and the growing efficiency of physical therapy departments now operating in many hospitals. The Council is ready at all times to aid in the establishment of suitable courses of instruction in physical therapy as a regular part of the curriculum.

REPORTS PUBLISHED

Among important articles published during 1940 under the auspices of the Council were "Acceptance of Sunlamps," "Shoes and Feet," "Tentative Minimum Requirements for Acceptable Electric Hearing Aids," "Council Inspection of Roentgen Ray Apparatus," "Physical Therapy in Arthritis with Special Reference to Home Treatment," "Progress Report of the Consultants on Audiometers and Hearing Aids," "Acceptance of Hearing Aids," "Dangers Incident to the Indiscriminate Use of Radium Compounds or Radon," three chapters of the Handbook on Amputations entitled "Physiologic and Psychologic Principles in Amputations," "General Principles Governing All Amputations" and "Sites of Election for Amputation," and two articles prepared by the Committee on Contraceptives of the Council entitled "Rubber Sheaths" and "Clinical Contraceptive Results in a Small Series of Patients."

Motion pictures prepared under the auspices of the Council and illustrating the use of sound physical therapy methods were shown on one hundred and eighty-three occasions, and seventeen scientific exhibits were installed and demonstrated at various scientific meetings. Council members and consultants delivered approximately ninety-five addresses on physical therapy, published thirty-six papers and three books, and participated in the teaching of twenty-six courses in physical therapy.

RESEARCH

Through its Committee on Research, the Council awarded eleven grants in aid of research. The grants were extended for use in the investigation of problems as follows:

1. To determine the therapeutic effects of prolonged periods of fever in early (primary and secondary) syphilis.
2. To secure a continuous record of the total daily amount of ultraviolet radiation of wave lengths 3,200 angstroms and shorter, under all weather conditions, as a function of the season and the geographic latitude.
3. To determine the influence of tissue temperature on the duration of viability of tissues in structures deprived of circulation in the living animal.
4. To study blood flow, especially of the abdominal viscera, as affected by external heat and cold, massage and other agents, and to develop an improved method of blood flow measurement based on a resistance thermometer principle.
5. To determine the effect of short wave heating on the healing of fractures.
6. To aid in a study of the biologic and medical effects of ultra short waves ranging between 1 to 15 cm.
7. To study the comparative value of direct heat versus reflex heat applied to the ischemic foot or leg.
8. To study the physiologic effects of short wave diathermy to be shown by gastroscopic investigations of cases of atrophic gastritis in tuberculosis, and by thermoelectric determinations of stomach temperatures before and after short wave diathermy applications.
9. To build a lamp with which to study the physiologic effects of the borderline rays of the visible and infra-red region and their eventual therapeutic usefulness.
10. To evaluate the forms of electric currents marketed by various manufacturers for muscle stimulation.
11. To study the effect of the radiant energy generated by high pressure quartz mercury lamps and low pressure mercury arc lamps on healing of noninfected wounds.

AUDIOMETERS AND HEARING AIDS

In its investigation of audiometers and hearing aids, the Council has had the advantage of active and intensive cooperation on the part of a group of highly qualified consultants who have devoted a great deal of time and effort to the study of these instruments. A report of progress, published in THE JOURNAL during the past year, indicates the following attainments:

1. Minimum requirements for acceptable audiometers have been formulated, adopted and published.
2. Audiometers for diagnostic use have been investigated and accepted.
3. Requirements for acceptable hearing aids have been formulated, adopted and published.
4. Hearing aids have been investigated and accepted or rejected, and this information has been made available to the profession and the public.
5. A survey of methods for determining the percentage of disability due to deafness has been undertaken.

ARTIFICIAL LIMBS

Through the diligent efforts of the consultants on artificial limbs, a group composed of surgeons and of representatives of the Association of Limb Manufacturers of America, Inc., the Handbook on Amputations is well on the way to completion. Three chapters of the book have already appeared in THE

JOURNAL, and the remaining chapters are now being reviewed by the Council. When these articles have been published they will be reprinted in book form.

ELECTROCARDIOGRAPHS

The preparation of a tentative list of requirements for electrocardiographs has engaged the attention of the Council and its consultants on electrocardiographs. Although the requirements are highly technical and must be given a great deal of consideration, rapid progress toward adoption is being made.

ROENTGEN RAY APPARATUS

The study of roentgen ray problems has progressed, and articles on "Council Inspection of Roentgen Ray Apparatus" and "X-Ray Protection" have been published in THE JOURNAL. A plan is being developed for the consideration of portable apparatus in cooperation, perhaps, with the National Bureau of Standards.

Summary

The Council on Physical Therapy has investigated and issued reports on physical therapy apparatus and methods, has encouraged research and has carried on an effective program of education. Members of the Council are serving on the Subcommittee on Physical Therapy of the National Research Council in connection with the development of the national defense program.

Representatives of the Council have participated in a conference called by the Federal Communications Commission to study the problem of interference with radio reception resulting from the use of diathermy apparatus. The Council disapproved of requirements which may lead to excessive increase in the cost of electromedical equipment and will participate in future conferences to study the problem.

Reports on sixty-eight devices were published in THE JOURNAL during 1940, among which were reports on diathermy apparatus, fever therapy equipment, hearing aids, infra-red generators, respirators, ultraviolet radiation equipment and others. A new edition of the booklet "Apparatus Accepted" was issued.

Eleven grants in aid of research were awarded, and reports on five of the research problems have been made to the Council.

Three chapters of the Handbook on Amputations have been published in THE JOURNAL, and the book is nearing completion.

A tentative list of requirements for electrocardiographs is being prepared, and the investigation of roentgen ray problems has progressed.

The Council's program of education included lectures, exhibits, addresses and the writing of thirteen informative articles by Council members and the consultants on education. The operation of efficient physical therapy departments in hospitals and the increasing number of courses in physical therapy given in medical schools are gratifying to the Council.

THE CHEMICAL LABORATORY

The Chemical Laboratory has been concerned largely with the examination of new products submitted to the Council on Pharmacy and Chemistry and of nostrums of interest to the Bureau of Investigation. In addition to the reexamination of already accepted products and of new dosage forms of old products, there have been developed tests and standards for new drugs. Considerable attention has been devoted to sulfathiazole and other derivatives of sulfanilamide.

Investigations have been completed by which new standards have been prepared for atabrine dihydrochloride, drisdol, nikethamide, sulfathiazole, zinc insulin crystals, gastric mucin, sodium r-lactate, sodium citrate solution, a number of calcium salts and other preparations.

The microchemical laboratory has been refurbished, and new electrolytic equipment has been added to provide for the extension of its activities.

Members of the laboratory staff have appeared before several scientific societies during the year.

Council on Industrial Health

INDUSTRIAL MEDICINE AND NATIONAL DEFENSE

The past year has been characterized by a greater realization, both in and out of the medical profession, of the important contributions which industrial medicine, surgery and hygiene can make to the national defense. The Council on Industrial Health promptly developed a preparedness program in the expectation of being as helpful as possible to the Committee on Medical Preparedness of the American Medical Association and the Division of Industrial Hygiene of the National Institute of Health. In the development of plans for increased and improved preventive and curative medical service to employed persons it was considered imperative that all possible sources of assistance within the profession be investigated. The details of the Council's program, therefore, included the following proposals:

1. To identify all physicians now engaged in any form of industrial medical service. This activity, later incorporated into the program of the Committee on Medical Preparedness, has progressed rapidly. According to the latest information, nine thousand, five hundred and fifty-seven physicians have indicated special interest in or limitation of practice to industrial medical work.

2. To obtain from each physician so engaged a statement of special qualifications for industrial work and the nature of medical facilities under his supervision. Information of this character is now on file concerning some three thousand, four hundred and sixteen physicians.

3. To acquire and publish information on the location and control of dangerous industrial health exposures.

4. To improve and augment the organization of cooperating committees on industrial health in the state and county medical societies to the end that—

- (a) Agencies can readily be formed in industrial areas with knowledge and authority to determine where industrial medical service is needed and to arrange that the service be supplied.

- (b) Proper coordination may exist between all independent agencies having an interest in industrial health, notably physicians in general and special practice, nurses, hygienists and other technical experts.

- (c) Proper correlation may exist of all activities bearing on the problem of industrial physical examination.

5. To assist in the development of intensive training courses in industrial health methods.

6. To insist that an assignment in industrial practice be regarded as equal in importance and dignity to a medical assignment with the combat forces.

Subsequently the Council undertook to discover all available consulting facilities in industrial hygiene and toxicology to which private practitioners and industrialists might turn in case of need. This work has proved to be of considerable interest and, although still incomplete, has suggested the necessity for elaborating standards to define the professional equipment and facilities of these consultants and laboratories.

The Council's defense program was recently reviewed at a joint session with the Subcommittee on Industrial Health and Medicine of the Federal Security Agency, appointed to establish coordination of medical activity in industry. At this meeting confidence was expressed in the efficacy of the facilities established in the American Medical Association for carrying out the terms of this program. A committee with representation from both the Council and the Subcommittee on Industrial Health and Medicine was appointed to draw up a statement of the requirements for training additional personnel, the cost of such a program and the preferred method of administration through the U. S. Public Health Service and jointly by committees on industrial health in the state medical associations and bureaus of industrial hygiene in the state governments.

EDUCATIONAL ACTIVITY

The general details of the Council's educational program have been described in previous reports and include an annual Congress on Industrial Health, a special Industrial Health Number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, a publication program covering essential details of medical

organization in industry and occupational diseases, maintenance of a clearing house of information for the profession and others, preparation of an outline and syllabus for industrial medical training useful in both undergraduate and graduate teaching, and the development of exhibit material. All these measures have been receiving continuous attention. The proposals regarding undergraduate and graduate instruction have been submitted to the Council on Medical Education and Hospitals in the hope that its influence might be exerted for prompt adoption of industrial medical teaching programs in the medical schools and in state and county medical societies.

The Council also is convinced that, if there is to be widespread demand of competent preventive industrial medical service, means must be provided for the joint education of the industrialist and the physician. Good precedent now exists for the development of such an educational program under medical society sponsorship, and the Council hopes to proceed actively in this direction henceforth. In the same way there should be many opportunities for assuring workers and workers' organizations of the many benefits attaching to medical and engineering supervision over working environment.

RELATIONSHIPS WITH GROUPS AND ORGANIZATIONS

Committees on Industrial Health in State and County Medical Societies.—The organization of cooperating committees on industrial health in constituent and component medical societies has proved to be of inestimable administrative value. The actual number of such committees in state medical societies cannot be greatly increased. Henceforth improvement in the nature of representation on these committees and extension of this method of organization into the county medical societies in industrial areas will be emphasized. The part which these committees will play in encouraging increased service to industry by physicians both in private and in industrial practice has been recorded in previous annual reports of the Council as well as in connection with the defense program. It is expected that a field force will be employed to hasten the adoption of recommendations and programs which the Council has developed regarding the practice of industrial medicine under ethical and scientific standards. Industrial health bulletins have been regularly prepared as a means of acquainting these cooperating committees with the Council's proposals and of interchanging experience and information between the states themselves.

Sections of the Scientific Assembly.—Active interest has been taken in the programs of the Section on Preventive and Industrial Medicine and Public Health. It has seemed advisable to invite the development of industrial health committees in all the sections of the Scientific Assembly that are regularly confronted with industrial problems, these committees to act in an advisory capacity to the Council. A first step has been taken through a joint meeting with the membership of the Committee on Industrial Dermatoses of the Section on Dermatology and Syphilology. An important feature would be to facilitate inclusion of industrial health subjects in the programs of all the sections.

Industrial Nurses.—The Council has considered it highly desirable to lend all possible encouragement to efforts to improve the professional status of industrial nurses. Current projects undertaken by the nurses themselves are the definition and establishment of suitable training courses, the preparation of a handbook on industrial nursing and an investigation of the possibilities for employment of industrial nurses as the first step toward providing preventive medical practice in small plants. The Council has been requested to act in an advisory capacity in these developments.

Insurance Organizations.—It has long been advocated that some consulting arrangement should exist between organized medicine and casualty insurance organizations in order that there might be clarification of the objectives of each. The first of such meetings has occurred between the Council and representatives of both stock and mutual insurance companies. Although no commitments occurred, it was demonstrated that: (a) The insurance group is vitally interested in and will actively support any program of medical education which will increase the supply of competent practitioners in the field of trauma, industrial hygiene and occupational disease. This attitude is related to

the increasing acknowledgment by insurance carriers that there should be a greater spread of compensation practice within the medical profession. (b) Periodic reviews of medicoinurance relationships should occur in the hope that better results will be obtained through voluntary consultation and agreement than through legislation. These periodic discussions should cover medical testimony, free choice of physician, fee schedules and similar problems. The sentiment was also expressed that the Council could act as a clearing and reference committee for research projects which the insurance organizations or others wish to inaugurate or support.

STANDARDS OF INDUSTRIAL PRACTICE

A subcommittee of the Council has completed the preparation of Principles Governing Industrial Medical Practice, which will be submitted to the Board of Trustees for approval.

NOMENCLATURE

The task of collecting and organizing a dictionary of terminology used in the whole field of industrial health is now largely completed by the Council's Committee on Nomenclature. After some additional editing and review, this material will be submitted to the Board of Trustees preparatory to publication.

WORKMEN'S COMPENSATION

The Council has continued to press for the adoption of uniform and complete reports covering occupational morbidity and mortality. The absence of uniform reports at the present time is a serious obstacle to any satisfactory definition of the extent of occupational health exposure and the relation of trauma to disease.

The Council has also brought to the attention of cooperating committees in the constituent state medical associations the actions passed by the House of Delegates regarding the desirability of medical representation on all workmen's compensation administrative boards.

INDUSTRIAL PHYSICAL EXAMINATIONS

Additional evidence reaffirms the opinion that preemployment and periodic physical examinations in industry are of real value in the conservation of the health of employees and in the control of occupational health exposures. If properly conducted, this practice will grow. The objectives, extent, technics employed, cost and personnel necessary are currently under investigation. The whole problem is one of unusual interest and will necessitate the issuance of separate reports from time to time on progress in this field. The Council has also been asked to submit a report on this subject with respect to the headquarters staff of the American Medical Association.

Summary

Much of the activity of the Council on Industrial Health during 1940 has been directed toward the adjustment of its original program to the requirements for national defense. This phase of the work has occurred under three major headings:

1. The determination of existing competent personnel for active industrial medical service and for consultation, investigation and teaching.
2. The definition of methods and establishment of facilities for the training of additional preventive industrial medical practice.
3. The correlation of the industrial work of the private practitioner, the industrial physician and the public health administrator particularly at state and county levels.

As a direct means of accomplishing these essential details of industrial medical preparedness, added stress has been placed on the Council's educational program through the Congress on Industrial Health, introductory and refresher courses, short but intensive teaching programs, county and state medical society meetings, publications, exhibits and clearing house and information services. Cooperation has been sought from the Council on Medical Education and Hospitals in order that its influence may be used to inaugurate promptly teaching programs in professional schools and, through post-graduate committees, in the state medical societies.

Field work continues to be regarded as essential to successful state and county relationships, without which the work of education and elevation of industrial medical standards would be seriously hampered. In this connection the Council has completed preparation of principles intended to guide the physician in all ordinary industrial relationships. The very considerable task of compiling and annotating a dictionary of industrial health terminology has also been largely finished and awaits further editorial and critical review in advance of plans for publication.

Closer working and advisory relationships are in prospect between the Council on Industrial Health and the specialty groups in medicine acting through the sections of the Scientific Assembly. A pattern for such an administrative arrangement has been set through consultation with the Committee on Industrial Dermatoses of the Section on Dermatology and Syphilology. In a similar way exploratory conversations have been conducted with the industrial nursing organizations and with insurance associations. All cooperating committees have been notified about the need for greater medical participation in the administration of workmen's compensation and for better integration between compensation boards, vocational rehabilitation services and the medical profession.

Bureau of Health Education

The work of the Bureau of Health Education has for the most part been directed along the same lines as heretofore reported to the House of Delegates.

During 1940 the Bureau received and answered approximately ten thousand letters from laymen. Regular Bureau correspondence included the receipt of and replies to almost five thousand letters, while miscellaneous mail, including communications stimulated by the Association's radio broadcasting program and those received from persons who visited the Association's exhibits at the New York World's Fair, the Museum of Science and Industry, Chicago, and the Cleveland Health Museum amounted to approximately two thousand five hundred pieces.

BUREAU PUBLICATIONS

Twenty-four new pamphlets were added to the list of publications maintained by the Bureau of Health Education, while ten of the pamphlets formerly used were revised and six discontinued. More than one hundred and fifty-nine thousand copies of the publications sponsored by this Bureau were sold in 1940.

A third set of health posters based on *HYGEIA* cover plates was prepared and published in 1940 after a large demand for the posters in the first two series had developed. Twenty-four such health posters made up into three sets, each set being provided at nominal cost, are now available.

The Director and Assistant Director of the Bureau have cooperated as fully as possible with the Editorial Department of *THE JOURNAL* and *HYGEIA*. Twenty-three articles originating in the Bureau of Health Education were published in 1940 in publications other than those of the American Medical Association.

RADIO PROGRAM

In cooperation with the National Broadcasting Company, the program "Medicine in the News" was completed in May, at which time the fifth season of dramatized network broadcasting terminated.

A new series of dramatized radio broadcasts under the title "Doctors at Work" was begun in November. For the first time in American Medical Association broadcasting, an evening hour on a nationwide network was assigned, namely, Wednesday, 10:30 p. m. eastern standard time. The program is a serialized story of a fictitious young man entering the profession of medicine. Incidental to the main theme of the program is an explanation, week by week, of the important specialties in medicine and the functions of the several specialists.

State and county medical societies and the Woman's Auxiliary have continued their valuable cooperation in publicizing the Association's broadcasting program.

At the New York session radio broadcasts were arranged in cooperation with ten local and network radio stations. There were thirteen local broadcasts, two National Broadcasting Company network broadcasts, three Columbia Broadcasting System network broadcasts and three Mutual Broadcasting System network broadcasts plus four broadcasts of news items incorporated in a regular news broadcast by one radio station. Foreign language broadcasts in Italian, Yiddish and German, translated from President Rock Sleyster's Columbia Broadcasting System talk, were arranged by the Medical Information Bureau of the New York Academy of Medicine.

The radio library maintained by the Bureau provided approximately six thousand prepared radio "talks" that were sent out on request. Thirty medical societies received material from the radio library for the first time in 1940. Approximately one hundred and twenty-five medical societies received through the Bureau of Health Education timely material suitable for special broadcasts. The members of the Bureau's staff delivered four radio talks over local stations outside Chicago while traveling to address meetings. The Hidalgo-Starr County (Texas) Medical Society translated a number of radio talks into Spanish and broadcast them in that language from Donna, Texas. The Bureau also assisted in preparing or editing radio scripts for other organizations.

MEETINGS AND CONFERENCES

In 1940 the Director and the Assistant Director of the Bureau of Health Education appeared before one hundred and twenty-six audiences in various parts of the United States. These appearances involved approximately 33,000 miles of travel, and communities in twenty states were visited. It was not possible to accept all the invitations extended to the Bureau's staff; fifty-four such invitations had to be declined because of schedule conflicts or for other important reasons. Attendance at nine medical meetings addressed by members of the Bureau's staff was four hundred and ninety-two. One hundred lay audiences were addressed with an attendance of twenty-five thousand, two hundred and seventeen persons, and seventeen addresses were delivered before audiences composed of teachers, nurses and members of other professional groups with an attendance of approximately five thousand.

HYGEIA CLIPPING LOAN SERVICE

The HYGEIA clipping collections were lent to six hundred and one physicians in forty-three states to aid them in preparing speeches for lay audiences. Local HYGEIA loan collection projects have been initiated by several medical societies. This development tending toward decentralization reveals a wholesome trend and is, in fact, the only way in which this Bureau can hope to meet all the health education needs of the medical profession.

COOPERATION WITH LAY ORGANIZATIONS

Joint Committee on Health Problems in Education.—The Joint Committee met in St. Louis in February during the meeting of the American Association of School Administrators. Dr. Charles C. Wilson, Hartford, Conn., was elected chairman of the Joint Committee, with Dr. Thurman B. Rice, Indianapolis, vice chairman and Dr. W. W. Bauer, Chicago, secretary. Dr. Edward Jackson, Denver, senior representative of the American Medical Association, declined reappointment at the termination of his one year term and was succeeded by Dr. George M. Lyon, Huntington, W. Va.

During 1940 final editorial approval was given to the book "Health Education," which is a complete reorganization and a virtual rewriting of the original report published in 1924 and previously revised in 1930.

A fourth Symposium on Health Problems in Education under the sponsorship of the Joint Committee together with the Section on Pediatrics, the Section on Preventive and Industrial Medicine and Public Health, the Section on Ophthalmology and the Section on Laryngology, Otology and Rhinology of the American Medical Association was held during the annual session of the Association in New York.

American Association of School Administrators.—The Director of the Bureau of Health Education was appointed by the American Association of School Administrators to its 1942

Yearbook Commission on Health Education. This commission met twice in 1940 for the preparation of a yearbook on health problems in the schools. The commission appears to intend to avoid controversies which will necessitate minority reports and to publish such consensus as can be arrived at or to present controversial questions impartially from both points of view.

4-H Clubs.—The National Committee on Boys and Girls Club Work (4-H Clubs) continued in 1940 as in previous years. A project which received some discussion in 1940 was an interest in tuberculosis control and education. On the advice of the Bureau of Health Education it appears that this project, when developed, will be handled largely through existing health and antituberculosis organizations rather than through separate channels originally contemplated by the National Committee.

National Congress of Parents and Teachers.—The National Congress of Parents and Teachers continues its Summer Round-Up of the Children, and the Director of the Bureau of Health Education continues on the advisory board. No new developments of any importance occurred in 1940, except that the congress discontinued the acceptance of Summer Round-Up blanks as a gift from the Association for the year 1940 but has renewed the previous arrangement for the year 1941.

General Federation of Women's Clubs.—The Director of the Bureau continues to be a member of the Advisory Committee to the General Federation of Women's Clubs, but no meetings were held in 1940.

American Public Health Association.—The Director of the Bureau of Health Education is a member of the Committee on Professional Education of the American Public Health Association Section on Health Education. The Director served as a member of the Planning Committee for the Health Education Institute of the American Public Health Association in connection with the annual meeting at Detroit in October.

Other Organizations.—Among other organizations with which the Bureau has maintained cooperative relations are the American Film Center (Committee on Public Health), the American Camping Association (Advisory Board), the Accident Prevention Conference, United States Department of Commerce (Safety Groups Committee), and the Joint Committee on Community Nursing Service (Advisory Committee).

COOPERATION WITH STATE AND COUNTY MEDICAL SOCIETIES

The Bureau has continued to serve as a clearing house of information to state and county medical societies and to be of assistance in developing cooperative programs and satisfactory relationships between the medical profession and other organizations working toward similar ends.

COOPERATION WITH GOVERNMENTAL AGENCIES

As in previous years, the Bureau has continued its cooperation with departments of the federal government and of state governments, including health departments and departments of education. It has also cooperated as fully as possible with local boards of health, school boards and libraries. The federal departments and divisions with which the Bureau has maintained cooperative relationship include the Federal Security Agency, Department of Commerce, Veterans' Administration, Department of the Interior, Treasury Department, Department of State, Department of Agriculture and Department of Labor.

The Director of the Bureau of Health Education was reappointed to serve on the General Advisory Committee of the United States Children's Bureau for three years.

PROTECTION OF RESEARCH

The Bureau of Health Education cooperated, as in the past, with the Committee for the Protection of Medical Research and in May distributed six thousand copies of the pamphlet entitled "Animals in Research" to the members of graduating classes of medical schools.

WOMEN'S HEALTH INTERESTS

In cooperation with the Woman's Auxiliary, the Bureau of Health Education made preparations for a questionnaire study of women's health interests with particular reference to the relationship of their economic and educational status to general reading and radio listening habits as well as to specific reading

and listening habits with respect to health material. The actual studies will be made by the woman's auxiliaries to county medical societies. No actual local studies were made in 1940, but considerable time was given to the preparation of basic arrangements in order that the study might proceed in 1941.

Summary

The Bureau of Health Education answered approximately ten thousand letters from laymen, five thousand from physicians and cooperating agencies and two thousand five hundred stimulated by World's Fair exhibits, health museums and radio programs. Twenty-four new health pamphlets were added to the list of publications, ten revised and six discontinued. More than one hundred and fifty-nine thousand copies of Bureau publications were sold by the Association in 1940, plus approximately one hundred and twenty thousand reprints which were sold in quantities to other organizations. A third set of health posters based on Hygeia cover plates was prepared. The Bureau contributed twenty-three articles to publications other than those of the American Medical Association.

A new radio series, *Doctors at Work*, was begun in November, supplanting the previous title *Medicine in the News*. Twenty-five network and local radio programs were broadcast over ten radio stations and three networks during the New York session of the American Medical Association, including one broadcast each in Italian, Yiddish and German. Approximately six thousand prepared radio talks were sent out to state and county medical societies from the Bureau's radio library of almost a thousand titles.

The Director and Assistant Director appeared before one hundred and twenty-six audiences, involving 33,000 miles of travel in twenty states and accounting for a total audience of approximately thirty thousand, seven hundred persons. Hygeia loan clipping collections were lent to six hundred and one physicians in forty-three states to aid them in preparing talks for local lay audiences.

The Bureau continued its cooperation with the National Education Association, the National Committee on Boys and Girls Club Work (4-H Clubs), the National Congress of Parents and Teachers, the General Federation of Women's Clubs, the American Public Health Association, the American Film Center, the American Camping Association, the Accident Prevention Conference of the U. S. Department of Commerce, the Joint Committee on Community Nursing Service and eight departments of the United States Government. The Director continued to serve on the General Advisory Committee of the U. S. Children's Bureau and was appointed one of twelve members of the 1942 Yearbook Commission of the American Association of School Administrators to prepare a Yearbook on Health.

Miscellaneous projects included continued cooperation with the American Medical Association Committee for the Protection of Medical Research and a cooperative project with the Woman's Auxiliary to the American Medical Association, namely a nationwide questionnaire survey of women's health interests.

Bureau of Legal Medicine and Legislation

CORRESPONDENCE

With respect both to volume and to subject matter the correspondence carried on by the Bureau during the year varied little from that during the period of the preceding report. Approximately one third of the correspondence was with constituent and component medical societies, a third with individual physicians and the remaining third with a miscellaneous group including attorneys, hospitals, colleges, organizations of various types and members of the lay public. As referred to in the report for last year, attorneys are with more frequency resorting to the medicolegal files of the Bureau.

The inquiries received related to a wide variety of subject matter, including aliens and medical licensure, authorization of necropsies and operations, basic science laws, birth control, amendments to the constitutions and by-laws of constituent and component societies, food and drug laws, cult practice in hospitals, malpractice, medical licensure, medical legislation, premarital and antepartum examination laws, medical and hospital service plans, tests for drunkenness, narcotics, partnership agreements, poisoning, cultists, roentgenograms, income taxes, expert testimony, trauma and various diseases, and workmen's compensation generally. It should be reemphasized that in supplying information the Bureau cannot function in the role of an attorney for the inquirers by giving personal legal advice. This emphasis seems necessary, because some physicians still expect that type of service from the Bureau. Physicians in need of legal advice should consult competent local counsel. If that counsel desires the benefit of the information accumulated in the files of the Bureau, a request from him will be given prompt consideration.

LAWS REGULATING THE USE OF BARBITURATES

During the year a study was made of the laws enacted in the several states to regulate the use of barbiturates. This study was prompted by the many inquiries received by the Bureau from constituent state medical associations. As of May 1, 1940 twenty-seven states had enacted laws of the type under discussion, in twenty-five of which retail sales of barbiturates are limited to sales on prescription. This indicates a rather general appreciation of the dangers incident to over the counter sale of these drugs. In Connecticut, while the law seems to limit the sale of barbiturates to sales on prescription, the attorney general of the state has ruled otherwise. In Oklahoma, sales may be made either on prescription or without a prescription if the pharmacist records such sales in much the same manner as he is required to record sales of poisons generally. These laws follow no well defined pattern. In four states the regulation of the sale of barbiturates is accomplished through the medium of food, drug and cosmetic acts. In two other states such drugs are brought within the purview of narcotic drug acts. In the other states, while special laws have been enacted to prohibit over the counter sales of these drugs, the requirements differ in the several states. In seven states compounds, derivatives and preparations intended for external application, such as gargles, sprays or liniments, are specifically exempted from the requirements of the laws; in the other states there is no such exemption. In ten states the laws definitely either forbid the refilling of prescriptions for barbiturates or provide that they may be refilled only on the direction of the prescriber. In New York, by rule of the Board of Regents of the University of the State of New York, no prescription for a hypnotic or somnifacient drug intended for internal use may be refilled if it bears the statement of the prescriber that it is not to be refilled. In two states that otherwise forbid the refilling of prescriptions except on the written order of the prescriber, prescriptions for phenobarbital may be refilled without such written order. In one state, Virginia, the law definitely states that a prescription may be refilled. In the other states the laws contain no express provision with respect to the refillability of prescriptions.

The results of the study made by the Bureau were published in *THE JOURNAL*, May 18, 1940 and are now available in a reprint that also contains, among other data, reports by the Council on Pharmacy and Chemistry on the dangers incident to the promiscuous use of barbiturates. This reprint should be of value to state associations that desire to initiate legislation to prevent the misuse of these drugs.

EXEMPT NARCOTIC PREPARATIONS

The Uniform Narcotic Drug Act, formulated by the National Conference of Commissioners on Uniform State Laws and approved by the House of Delegates at the Milwaukee session in 1933, provides in section 8 that certain preparations containing narcotics in small quantities may be sold without prescriptions; that is, preparations that contain in 1 fluidounce or, if a solid or semisolid preparation, in 1 avoirdupois ounce (a) not more than 2 grains of opium, (b) not more than 1/4 grain of morphine or any of its salts, (c) not more than 1

grain of codeine or any of its salts, (d) not more than $\frac{1}{8}$ grain of heroin or any of its salts and (e) not more than one of the drugs named.

The United States Commissioner of Narcotics has submitted to the Bureau a proposed amendment to this section that contemplates, essentially, that, with the exception noted below, preparations now exempt under the act may be sold only on prescription. The exemption relates to preparations containing in 1 fluidounce or, if a solid or semisolid preparation, in 1 avoirdupois ounce, not more than 1 grain of codeine or any of its salts. The Commissioner of Narcotics presents the following reasons for the suggested amendment:

Section 8 of the Uniform Narcotic Drug Act in its present form exempts from the general requirements of that law preparations which contain certain small portions of narcotics, putting all other preparations in the prescription class. This provision may now be deemed too liberal in view of existing world conditions. Our supply of opium and coca leaves is imported, and, as a consequence, at this time every effort should be made to conserve the quantity on hand for legitimate medical purposes. Recently, persons addicted to the use of narcotics who do not have a medical need therefore have had increasing difficulty in obtaining a supply of narcotics from illicit sources. As a result, they have turned to druggists and are obtaining their narcotic dosage through the purchase of narcotic preparations conditionally exempted from the operation of the Uniform Act by section 8 thereof. Not only have they been obtaining these preparations ordinarily used internally (such as paregoric) but they have also been obtaining narcotic preparations prepared for external use only and have been removing the narcotics therefrom for internal use to gratify addiction. A preparation known as "Lead and Opium Wash" is being procured for such a purpose at the present time.

If the proposed amendment is adopted it should have the effect of conserving the supply of opium and opium derivatives on hand, as well as drastically reducing the possibility of sale of the narcotic-containing preparations for abusive use.

The Commissioner states that codeine preparations generally speaking are not considered susceptible of abusive use from the standpoint of gratification of narcotic drug addiction.

If there exists in the Uniform Narcotic Drug Act a loophole through which addicts are now able to satisfy their addiction by using preparations included in the so-called exempt class, it would seem that that loophole should be closed. It may be pointed out that the commissioner has already taken steps looking toward the amending of the narcotic laws of the several states along the lines suggested by his proposed amendment. Legislation to effect this result is pending, at the time that this report is written, in seventeen states. The proposed amendment has already been enacted in Tennessee.

COURT DECISIONS OF MEDICAL INTEREST

The Report of the Committee on Medicolegal Blood Grouping Tests, adopted by the House of Delegates in 1937, was cited in a case arising in the District of Columbia as sufficient authority to establish the scientific soundness of blood grouping tests in cases of disputed paternity. This case involved the paternity of a baby born in wedlock. The trial court issued an order requiring the husband, wife and child to submit to blood grouping tests and this order was affirmed by the United States Court of Appeals for the District of Columbia, the court saying, in part:

The value of blood grouping tests as proof of nonpaternity is well known. On this point it is enough to cite the report of the American Medical Association's Committee on Medicolegal Blood Grouping Tests, which shows that although such tests cannot prove paternity, and cannot always disprove it, they can disprove it conclusively in a great many cases provided they are administered by specially qualified experts. . . . Three eminent scientists, Drs. Ludvig Hektoen, Carl Landsteiner and Alexander S. Wiener, composed the committee. Their report is based on their own extensive experiences and on the literature of the subject. Their data comprise thousands of tests here and abroad.

As pointed out in the Report of the Committee on Medicolegal Blood Grouping Tests, two states, New York and Wisconsin, had at that time, 1937, passed laws specifically authorizing courts to require submission to blood grouping tests in cases of disputed paternity and providing for the admissibility in evidence of the results of such tests. Since that time, similar laws have been enacted in Maine, New Jersey and Ohio. All these laws provide that evidence of the results of such blood grouping tests will be admissible only when such tests definitely disprove the paternity of the putative father.

The Supreme Court of Florida, in an opinion handed down on Sept. 20, 1940, held that if a person undertakes to cure those who search for health and who are, because of their

plight, more or less susceptible of following the advice of any one who claims the knowledge and means to heal, that person cannot escape the consequences of his gross ignorance of accepted and established remedies and methods for the treatment of diseases from which he knows his patients suffer, and, if his wrongful acts, positive or negative, reach the degree of grossness, he will be answerable to the state in a manslaughter prosecution if the patient dies as a result of the treatment. This case involved a chiropractor who undertook to treat the infected foot of a patient suffering from diabetes. The chiropractor, it was alleged, knowing that the patient had diabetes, advised against the continued use of insulin and the patient died.

Several cases decided during the year involved the scope of osteopathic practice. In Kansas and Georgia, osteopaths were denied the right to register under the Harrison Narcotic Act on the ground that their state licenses did not authorize them to use narcotics. In another Georgia case, the Supreme Court of that state held that a license to practice osteopathy did not authorize the holder to engage in the practice of optometry. In Florida the right of the governing board of a municipal hospital located in Miami to deny to osteopaths the right to practice in the institution was upheld. An intermediate appellate court in Pennsylvania, in a three to two decision, held that an osteopath was a "licensed physician" within the meaning of the state narcotic act and for that reason entitled to use narcotics. An appeal to the Supreme Court of Pennsylvania was denied. In Ohio the Supreme Court held that an osteopath was a "licensed physician" within the meaning of the state law defining eligibility for the office of coroner.

An important case arose in Pennsylvania, involving the right of the unions to unionize hospital employees. Apparently, attempts were made to form a union among hospital employees which were opposed by the hospitals involved. The unions appealed to the Pennsylvania Labor Relations Board, charging unfair labor practices on the part of the hospitals. The matter came before the Court of Common Pleas of Dauphin County when the hospitals filed a bill for an injunction to restrain the Labor Relations Board and the unions from proceeding with the plans under considerations. The lower court granted the injunction and the defendants appealed to the Supreme Court of Pennsylvania, which in a per curiam decision affirmed the decree of the court below, a decree referred to by the supreme court as "comprehensive." The lower court, in reaching its decision, held that a hospital neither is an industry nor does it engage in a trade and that therefore such an institution does not come within the purview of the laws of Pennsylvania relating to labor disputes generally. Furthermore, the court said that it had not been the custom in the past to unionize hospitals. The effect of unionization and attendant efforts to enforce demands would involve, the court pointed out, results far more sweeping and drastic than mere property rights. The question of profit for the employer or wages for the employee are not alone involved. It is not merely a matter of suspending operations, ceasing work and stopping production, such as might be true in a steel mill or automobile factory; it is a question of protecting the health, safety and, in many cases, the very lives of those persons who need the service a hospital can render. This decision constitutes a most important contribution to judicial literature.

MODEL VITAL STATISTICS ACT

The United States Bureau of the Census has for several years been engaged in the formulation of a draft of a model vital statistics act suitable for enactment by the several states. Several drafts have been prepared, the latest of which was considered at a meeting of the National Conference of Commissioners on Uniform State Laws in Philadelphia, Sept. 7, 1940. As a result of that consideration the draft was revised and the conference then adopted the following resolution:

Be it resolved by the National Conference of Commissioners on Uniform State Laws, at its fiftieth annual conference held in Philadelphia on the 7th day of September 1940, that the Model Vital Statistics Act has been prepared and has been tentatively approved for final adoption by the conference, but that the same lie over for a year for further study of detail by the conference and its committee; and that pending final adoption by the conference this act be used as a basis of any intervening legislation on the subject.

Further consideration, it is assumed, will be given the draft. The Board of Trustees has designated the former Director of the Bureau of Legal Medicine and Legislation as the representative of the Association to collaborate in the completion of the draft.

CADAVERS FOR TEACHING PURPOSES

In Illinois an act was passed in 1885 providing that dead bodies that otherwise would be buried at public expense are to be delivered to any physician or surgeon or to any medical college or school, public or private, on his or their request, to be used for advancement of medical science. This act is similar to the acts obtaining in a number of states and is commonly referred to as the anatomical act. The duties of embalming and distributing cadavers obtained through the operation of the foregoing act are discharged by an association of medical schools known as the Demonstrators Association of Illinois.

A steady decline during the last several years in the number of cadavers that have been made available under the Illinois anatomical act has caused the Demonstrators Association concern, and in January of this year the Bureau was approached in the hope that some means might be found to remedy the situation. It was pointed out that the number of available cadavers had decreased from 695 during the fiscal year 1937 to 599 for the fiscal year 1940 and that it was anticipated that this downward trend would continue. This shrinkage in the number of cadavers, it is said, has been due, in the main, to the fact that relief funds have provided means for burial of many bodies that otherwise would be distributable under the anatomical act. Since under that act the only cadavers that are available to the Demonstrators Association are those to be buried at the expense of the state, burial grants from relief funds would necessarily seem to be an important factor in the situation that has developed.

To obtain a more general picture of conditions, the Bureau undertook a survey of the situation in all the states. That survey is under way at the time this report is being prepared. Sufficient data have already been assembled, however, to indicate clearly that the described conditions in Illinois are by no means exceptional; many other states are experiencing the same shortage of cadavers for teaching and other scientific purposes, and that shortage is attributed largely to the use of relief funds to bury bodies.

What solution, if any, can be found to halt this trend is not readily apparent. The survey will be completed and the accumulated data will be made available as a basis for further consideration of this problem. Basically, it would seem to be a problem of medical education which does not fall within the ambit of the normal activities of the Bureau.

CONSULTATION SERVICE BY MAIL

In 1939 a Pennsylvania law was passed requiring an applicant for a marriage license to submit a statement from a duly licensed physician of the commonwealth certifying that the applicant is not infected with syphilis or, if infected, is not in a stage of the disease which is likely to become communicable. Any person having been denied such a statement may appeal to the department of health for a review of his case, and the department may, after appropriate investigation, issue or refuse to issue a certificate in lieu of the required physician's statement. To facilitate the review of such a case on appeal, the department of health proposed to utilize the facilities of the Institute for the Control of Syphilis at the University of Pennsylvania. This institute was to be supplied with a statement of facts embodying the history of the applicant's case, his present physical condition, the results of serologic tests and other pertinent information. Solely on the basis of this statement, it was proposed, the institute would advise the department of health what action to take on the appeal. It was planned, too, to make the services and facilities of the institute available to licensed physicians throughout the commonwealth for purpose of consultation.

Before this plan was put into operation, the department of health submitted it to the Pennsylvania Department of Justice, asking specifically whether the director or any individual member of the institute would incur civil liability "for giving advice by correspondence regarding the care of, or prescribing

treatment for, a patient he has never seen or examined, if the advice actually results in unfavorable or injurious consequences to the person regarding whom it was given." The Department of Justice of Pennsylvania, in a well reasoned opinion, answered the submitted question in the affirmative. Consultation among physicians, the opinion pointed out, is common practice but almost invariably the consultant is afforded the opportunity to and does examine the patient before making a diagnosis or suggesting a course of treatment, and to follow any other practice is to depart from the accepted procedure. The opinion referred to the fact that the provisions of the Principles of Medical Ethics of the American Medical Association having to do with consultations obviously contemplate a personal relationship based on physical examination by the consultant, and the Judicial Council of the Association has repeatedly condemned as unethical the physician who without seeing the patient attempts to diagnose and prescribe treatment by mail. A consultant who does not personally confer with and examine the patient, in the opinion of the department, accepts at his own peril statements and reports made to him by the attending physician, and to hold otherwise would be to relieve the consultant of his burden to exercise the due care and diligence required of him by law, "due care" contemplating and requiring a diligent physical examination of the patient. The department concluded, therefore, that the members of the institute would be liable for damages in an action for malpractice "for making a diagnosis of, or prescribing treatment for, a patient they have never seen or examined, if such diagnosis or advice actually results in injurious consequences to the person regarding whom it was made or given."

The Bureau collaborated with the Department of Justice of Pennsylvania in its study of the problem submitted to it by the department of health.

FEDERAL LEGISLATION

Seventy-Sixth Congress.—At the New York session the House of Delegates instructed the Bureau to continue its efforts to have clarified some of the uncertainties in the Wagner-George hospital construction bill then pending in the Congress. This was done. The report adopted by the House of Delegates with respect to the bill was formally presented to the Committee on Interstate and Foreign Commerce, and that committee was urged to give consideration to the recommendations contained in that report, if the bill was to be advanced further along its legislative course. No action was taken by the committee on the bill, however, and it died when the Seventy-Sixth Congress automatically expired.

Other measures that met a similar fate included the Wagner national health bill, the Mead hospital construction bill, the so-called Capper-Epstein health insurance bill and the Tolan proposal to authorize chiropractors to treat beneficiaries of the United States Employees' Compensation Act. A hearing was held on the bill last mentioned, at which the opposition of the Association to its enactment was presented. A detailed listing of other bills that failed of enactment would unduly and perhaps unnecessarily extend this report. A reference to the more important measures, however, may be found in an editorial published in *THE JOURNAL*, Jan. 11, 1941. Suffice it here to say that no measure of primary medical importance was enacted by the Congress between the last meeting of the House of Delegates and the expiration of the Congress.

Seventy-Seventh Congress.—President Roosevelt in his annual message to the new Congress said that "we should widen the opportunities for adequate medical care." In his end of the year message to the American people, Federal Security Administrator Paul V. McNutt said, in part:

In time of peace, health is economy; the Public Health Service has impressed America with the tremendous waste involved in illness and premature death. But, in preparing a nation for defense, health has become a more acute problem; for health is strength. Health keeps aircraft pilots at their controls, gunners at their guns, workers on their jobs; and healthy homes maintain civilian morale. The great increases in public health facilities developed as the result of the Social Security Act and the Venereal Disease Control Act enable us to start far ahead of where we found ourselves in 1917. But in industrial hygiene, venereal disease control, building positive health through better nutrition, it is the normal agencies of the public administration that will take the load. There must be hospital and treatment facilities in every community sufficient to meet the needs.

Shortly after the Congress convened, Senator Wagner publicly announced that a new bill was being formulated to make effective a national health program. As outlined by Senator Wagner, this bill will provide for cooperation between the federal and state governments in construction of hospitals, in the payment of compensation for disability wage losses, in expansion of maternal, infant, child hygiene and welfare services, in general public health service and in general medical care. There were announcements, too, of a proposed bill to provide federally financed health care to every worker in essential defense activities. It was estimated that the plan would embrace, at the start, about ten million persons and that the government would pay the cost of such medical care to be rendered "probably" by private practitioners, "thus avoiding any controversy over socialized medicine."

The Social Security Board in its report for 1940 reiterates endorsement "of the goals and principles" proposed in the Report on National Health Prepared by the Interdepartmental Committee to Coordinate Health and Welfare Activities.

These and other similar statements forecast legislation that will require careful consideration.

Federal Legislative Bulletin.—Beginning with the Seventy-Seventh Congress, the Bureau inaugurated a Federal Legislative Bulletin service for the purpose of supplying the several state associations with detailed information concerning bills of medical interest in Congress. These bulletins are issued monthly and copies are sent to the president, secretary and chairman of the legislative committee of each state association. In addition, the Bureau makes available to each state association, within certain limits, additional copies of the bulletin so that a wider distribution of the contents of such bulletins may be made in each state, if that is desired. It is hoped that this informational service will fill a definite need.

Among the bills of medical interest that are before the Congress for consideration, those noted herein seem to merit brief references:

Industrial Diseases.—Several bills have been introduced relating to industrial health. S. 193, introduced by Senator Murray, Montana, and pending in the Senate Committee on Education and Labor, provides for a federal appropriation in such an amount as the Secretary of Labor may deem necessary to be utilized in making grants to states to enable them to make more adequate provision for compensation for disability or death of workers from silicosis or other dust diseases. Under this bill, grants will be made by the Secretary of Labor to states whose plans have been approved by that federal official. S. 509, also introduced by Senator Murray and pending in the Senate Committee on Education and Labor, relates to the control and prevention of industrial conditions hazardous to the health of employees. This bill charges the Secretary of Labor with the responsibility of administering it, and all state plans must be approved by that official. A state plan, among other things, must provide for its administration by the state labor department or other agency charged with the administration of the general labor laws of the state. Another bill, S. 955, introduced by Senator Guffey, Pennsylvania, would authorize the Secretary of the Interior to make annual inspections and investigations in coal mines to obtain information relating to health and safety conditions, accidents and occupational diseases therein. It has been favorably reported by the Senate Committee on Mines and Mining, and a companion House bill, H. R. 2082, has passed the House of Representatives.

Tuberculosis.—Three bills are pending having for their objective the better control of tuberculosis. S. 195, introduced by Senator Murray, Montana, is pending in the Senate Committee on Finance, and a companion bill, H. R. 3492, introduced by Representative Kilday, Texas, is pending in the House Committee on Interstate and Foreign Commerce. This bill proposes to aid states, counties, cities, health districts and other political subdivisions to establish, extend and improve measures for the prevention, treatment and control of tuberculosis, including the provision of facilities for sanatorium and other care for persons with tuberculosis and for the making of studies, investigations and demonstrations. State plans must be approved by the Surgeon General of the Public Health Service. Federal appropriations would begin at \$7,750,000 for the first fiscal

year, \$33,500,000 for the second year, and \$37,000,000 for the third year. For each fiscal year thereafter such sum as may be necessary will be authorized, with the limitation that after the fiscal year 1946 the federal appropriations may not exceed \$17,500,000.

H. R. 70, introduced by Representative Elliott, California, is pending in the House Committee on Interstate and Foreign Commerce. It relates to the prevention and control of tuberculosis among migrants.

The other bill, H. R. 3463, was introduced by Representative Voorhis, California, and is pending in the House Committee on Interstate and Foreign Commerce. This bill proposes two things. First, it provides for loans to states, counties, cities and other political subdivisions for the construction of tuberculosis hospitals and for their maintenance for a period of not more than four years. These loans would be made from federal appropriations of \$25,000,000 for the fiscal year ending June 30, 1941, \$50,000,000 for the fiscal year ending June 30, 1942, and \$100,000,000 for each of the ten fiscal years thereafter. Second, additional money would be made available for grants-in-aid in the prevention and control of tuberculosis. It is contemplated that free diagnostic and treatment facilities will be provided by all health departments and clinics receiving funds under the act (1) for the diagnosis and emergency treatment of any patient referred by a private physician either for continued treatment or for consultative or diagnostic advice and opinion and (2) for any patient unable to afford private medical care. If and when tuberculosis ceases to be a national problem, the bill provides such physical equipment and facilities as the federal government may have acquired by virtue of the operation of the bill will thereafter be utilized in the control of cancer or other major health hazards.

Cancer.—Representative Rogers, Massachusetts, proposes by H. R. 1007, pending in the House Committee on Interstate and Foreign Commerce, to make available a federal appropriation for the first year of operation of the bill in the amount of \$2,300,000 and thereafter such sums as may be necessary to enable the Public Health Service to assist states, counties, cities or other political subdivisions to extend and improve measures through public and private institutions and organizations for the diagnosis, treatment and control of cancer, including the provision of hospital, diagnostic, clinic and other facilities. State plans must be approved by the United States Public Health Service. To the extent that facilities may be available, the bill proposes, not to exceed one hundred persons suspected of having or known to be suffering from cancer may be cared for in hospitals of the United States Public Health Service for purpose of diagnosis, treatment and clinical study.

Dental Diseases.—Senator Murray, Montana, has introduced a bill, S. 194, proposing to authorize the Surgeon General of the Public Health Service to (1) conduct researches, investigations, experiments and studies relating to the cause, diagnosis and treatment of dental diseases; (2) assist and foster similar research activities by other agencies, public and private, and (3) promote the coordination of all such researches and activities and the useful application of their results, with a view to the development and prompt widespread use of the most effective methods of prevention, diagnosis and treatment of such diseases. The bill proposes a federal appropriation of \$75,000 for the fiscal year ending June 30, 1942, and that for the five succeeding fiscal years such sum shall be increased \$10,000 each year. The bill is pending in the Senate Committee on Education and Labor.

National Physical Fitness Institute.—Senator Walsh, Massachusetts, has introduced a bill, S. 797, for the establishment of a National Physical Fitness Institute. The bill is pending in the Senate Committee on Education and Labor and is similar to a bill introduced by the same author in the Seventy-Sixth Congress, S. 4179. With respect to the former bill, it was stated that it was sponsored by Frederick Rand Rogers, Ph.D., of Boston, whose Physical Fitness Index Test was commented on, unfavorably, in the Queries and Minor Notes department of *THE JOURNAL*, May 6, 1939, page 1852. The pending bill proposes to create in the Federal Security Agency a National Physical Fitness Institute with authority (1) to select, prepare and conduct research with respect to tests and testing instru-

ments for the purpose of testing physical fitness and with respect to follow-up procedures, forms of reports, and methods of cooperating with agencies engaged in medical and health work, for the purpose of conserving and increasing the physical fitness of the American people; (2) to conduct research to determine the most efficient and practical methods of conserving and increasing physical fitness; (3) to train specialists in the work of conserving and increasing physical fitness; (4) to prepare reports and bulletins with respect to the conservation and increase of physical fitness for use by organizations and the general public; (5) on request, to investigate the needs of organizations and industries for, and, to the extent possible with its personnel, to cooperate with such organizations and industries in providing physical fitness services for their members and employees, and (6) to cooperate with departments and other agencies of the government in programs designed to conserve and increase the physical fitness of their officers and employees.

Deferment Under the Selective Service and Training Act of Medical Students, Interns and Residents.—Senator Murray, Montana, proposes by S. 783 to amend the Selective Training and Service Act of 1940. The bill is pending in the Senate Committee on Military Affairs and was apparently introduced as a substitute for a former bill introduced by the same author, S. 197. The new bill provides, among other things, that (1) students who are preparing for the degree of doctor of medicine or bachelor of medicine at medical schools, (2) students who are preparing for the degree of doctor of dental surgery or doctor of dental medicine at dental schools, (3) hospital interns and resident physicians and surgeons who are graduates of medical schools and are eligible as such graduates for the examinations given by the National Board of Medical Examiners or who were so eligible at the time of their graduation from such medical schools, (4) hospital dental interns and resident dentists who are graduates of schools of dentistry or hold degrees of doctor of dental surgery or doctor of dental medicine, and (5) teachers at medical and dental schools shall be exempt from training and service, but not from registration, under the Selective Training and Service Act.

Any such medical or dental student, hospital intern or resident physician, surgeon or dentist, or medical or dental school teacher, who is a member of a reserve component of the land or naval forces of the United States, may not, if the bill should be enacted, be ordered or called to active duty or into active service in any of such forces, except in time of war. Any person already called into service who if the pending bill had been enacted would have been exempt from such service, shall, it is proposed, be discharged on his own request.

This bill further provides that any individual selected for training and service who is a graduate of a medical school and is eligible as such a graduate for examination given by the National Board of Medical Examiners or who was so eligible at the time of his graduation, or who is a graduate of a school of dentistry or holds a degree of doctor of dental surgery or doctor of dental medicine and who holds a license to practice medicine, surgery, or dentistry in any state, territory or possession and is engaged in such practice at the time of his selection and whose physical and mental fitness for such training and service has been satisfactorily determined, shall, in lieu of induction into the land or naval forces of the United States, be commissioned an officer in the Medical Department Reserve, Officers' Reserve Corps, and ordered into active military service as provided by law.

Eligibility for Appointment as Medical Officers in Army and Navy.—Representative McCormack, Massachusetts, proposes by H. R. 3571, pending in the House Committee on Military Affairs, that no individual who is licensed to practice medicine under the laws of any state, territory or the District of Columbia shall be ineligible for appointment, or for examination for appointment, as a medical officer in the active or reserve components of the military or naval forces of the United States solely by reason of any rating or classification of the medical school from which such individual was graduated. This bill is identical with a bill introduced by Representative McCormack in the Seventy-Sixth Congress, H. R. 10484. With respect to the former bill, Representative McCormack stated on the floor

of the House that in introducing the bill he had in mind the graduates of the Middlesex University School of Medicine of Boston.

Appointment of Dietitians and Physical Therapy Aides in the Army.—S. 839, introduced by Senator Sheppard, Texas, and pending in the Senate Committee on Military Affairs, and H. R. 3790, introduced by Representative May, Kentucky, and pending in the House Committee on Military Affairs, propose to authorize the Secretary of War to appoint in the Medical Department of the Army such number of female dietitians and female physical therapy aides as he may determine to be needed in the administration of laws providing for the hospitalization in army hospitals of officers, warrant officers, and enlisted men of the Regular Army. These bills provide for the grades to be allocated to such dietitians and physical therapy aides and for promotions to higher grades.

Chiropody Corps in the Medical Corps of the Army.—Representative Haines, Pennsylvania, by H. R. 3738, pending in the House Committee on Military Affairs, proposes to establish a Chiropody Corps in the Medical Corps of the United States Army. Original appointments will be made in the grade of first lieutenant. An officer of the corps, the bill proposes, shall be promoted to the grade of captain after three years' service, to the grade of major after twelve years' service, to the grade of lieutenant colonel after twenty years' service and to the grade of colonel after twenty-six years' service. It is contemplated that the Surgeon General of the Army shall appoint from time to time qualified officers in like number to that established by law for the Dental Corps, and such officers shall have the rank, pay, promotion and allowances as well as the retirement provisions of officers of corresponding grades in the Dental Corps. Provision is made, too, for the establishment of a Chiropody Reserve Corps.

Construction of Hospitals.—Representative Fulmer, South Carolina, has introduced a bill, H. R. 584, proposing to promote the national health and welfare through appropriation of funds for the construction of hospitals. This bill is identical with the Wagner-George hospital construction bill as it was introduced in the Seventy-Sixth Congress. The bill is pending in the House Committee on Interstate and Foreign Commerce.

Chiropractors and the United States Employees' Compensation Act.—Representative Tolan, California, has reintroduced his bill to give chiropractors the right to treat federal employees entitled to the benefits of the United States Employees' Compensation Act. This bill, H. R. 1052, is pending in the House Committee on the Judiciary and is identical with a bill introduced in the Seventy-Sixth Congress by the same author.

Federal Department of Health.—The establishment of a federal department of health is proposed in a bill introduced by Representative Pfeifer, New York, H. R. 1791. At the head of this department, it is contemplated, will be a Secretary of Health who will be a "member of the medical profession." There will be transferred to this department the Food and Drug Administration, the Bureau of the Census, Division of Vital Statistics, the Freedmen's Hospital and St. Elizabeths Hospital, the Children's Bureau, and all functions of the United States Public Health Service, Bureau of Narcotics, and the Health Department of the District of Columbia. The President will be authorized by executive order to transfer to this department the whole or any part of any bureau, service or other agency of the government primarily engaged in fostering and promoting health and sanitation. This bill is pending in the House Committee on Expenditures in the Executive Departments.

Compulsory Health Insurance.—The perennial health insurance bill sponsored by the American Association for Social Security, otherwise known as the Epstein bill, has been introduced in the Congress by Senator Capper, Kansas, as S. 489. It is pending in the Senate Committee on Education and Labor and proposes a federal appropriation of \$50,000,000 for the fiscal year ending June 30, 1941, and thereafter a sum sufficient to carry out the purposes of the act, to induce states to embark on a combined program of compulsory and voluntary health insurance. The bill proposes to engraft the scheme on the Social Security Act, and the Social Security Board will be charged with the duty of approving state plans.

National Preparedness Act of 1941.—Under the sponsorship of the American Association for Health, Physical Education and Recreation, Representative Schwert, New York, since deceased, introduced H. R. 1074, to enact a "National Preparedness Act of 1941 for the improvement of physical and social fitness." It is pending in the House Committee on Education. The bill proposes federal appropriations totaling eventually \$200,000,000 a year. Its provisions will be administered by the Office of Education of the federal government and by state educational authorities. It contemplates the development of (a) plans for school programs of physical education, instruction and guidance in healthful living and wider recreational use of school facilities and (b) plans for the establishment of school camps.

A plan for a school program, the bill proposes, must include (1) programs of physical education to develop physical fitness and for the prevention and correction of physical deficiencies; (2) instruction and guidance in health and safety for children, youth and adults of such a nature as to help individuals safeguard and promote their own health and contribute to the health of their family and community; (3) special physical education, health instruction and guidance, and recreational activities for handicapped pupils; (4) supervision to insure safe and sanitary school conditions and programs and procedures permitting healthful school living, and (5) provision of adequate personnel and direction of the educational program in the wider use of school facilities to serve the recreational needs of children, youth and adults and for the improvement of fitness of out of school youth, men aged 21 to 35, and other adults necessary to home defense and defense industry occupations. Plans for the operation of school camps must include, among other items, opportunities for simple, vigorous living to promote physical fitness through appropriate body-building activities, proper nutrition, health instruction and rest.

Advisory councils are to be set up to advise the Commissioner of Education and to advise the local education authorities. These councils, apparently, are to be purely advisory and are to be appointed by the United States Commissioner of Education and by the state educational authorities, respectively. The bill contains a most unusual provision to the effect that the scope of the activities to be carried on under it may be extended in any state apparently without any limit whatever if the legislature of that state decrees.

Contract Surgeons of the Spanish-American War.—Senator McNary, Oregon, by S. 617, pending in the Senate Committee on Pensions, proposes among other things to provide so-called service pensions for contract surgeons of the Spanish-American War. Under an act approved May 1, 1926 veterans of the Spanish-American War, and female contract nurses of that war, are entitled to pensions based on service and age alone, without reference to disabilities incurred in actual service. Contract surgeons, on the other hand, are now entitled to pensions only if they were disabled in service. This bill, therefore, seeks to do away with this illogical and unjust discrimination against contract surgeons.

Scientific Organizations and the Social Security Act.—Senator Walsh, Massachusetts, has introduced a bill, S. 670, pending in the Senate Committee on Finance, to bring within the old age and survivors insurance benefits provisions of the Social Security Act employees of any corporation, community chest, fund or foundation, organized and operated exclusively for religious, charitable, scientific, literary or educational purposes, or for the prevention of cruelty to children or animals.

Health in Areas Adjoining Military and Naval Reservations and Plants Engaged in Defense Work.—H. R. 3204, making additional appropriations for the fiscal year 1941 urgently required for the Work Projects Administration and certain other federal agencies, has been enacted into law. One section of this law provides a federal appropriation of \$525,000 for the fiscal year ending June 30, 1941, to enable the United States Public Health Service to assist state and local health authorities in health and sanitation activities in (1) areas adjoining military and naval reservations, (2) areas where there are concentrations of military and naval forces, (3) areas adjoining government and private industrial plants engaged in defense work and (4) private industrial plants engaged in defense work. The

money will be available, too, to provide emergency health and sanitation services in government industrial plants engaged in defense work and in areas adjoining military and naval reservations outside the United States.

Another bill, H. R. 3570, introduced by Representative Latham, Texas, proposes an appropriation of \$150,000,000 to provide additional community facilities made necessary by national defense activities. This money will be utilized, in accordance with such directions and regulations and on such terms and conditions as may be prescribed or approved by the President, (a) to make loans or grants or both to public agencies for construction, rehabilitation and operation of such facilities; (b) to construct, operate, lease or sell such facilities, including the acquisition of land and the demolition, repair or alteration of existing structures where necessary, and (c) for necessary administrative expenses.

The Assistant Coordinator of Health and Welfare and Related Defense Activities appeared before the House Committee on Public Buildings and Grounds, March 4, and presented detailed information relative to the several purposes for which this federal money will be expended. It will be used, he said, to provide school facilities, for the construction of sewage and disposal systems, for the paving of streets, for the construction of community centers, for mosquito control work, for milk pasteurizing plants, for water supplies, and for medical and hospital facilities and care. Out of the total appropriation to be authorized, he said, \$25,000,000 will be used for the construction of hospitals and \$4,200,000 for the construction of clinics. In addition, annual grants of \$2,200,000 will be made for hospital care of transient indigents, \$2,800,000 for the ambulatory care of transient indigents and \$1,000,000 for hospital operation. The Assistant Coordinator said, in part:

From the standpoint of medical care, especially hospitalization, the civilian population of defense areas may be considered under two broad categories: (1) The employed or self-sustaining group, who on account of improved economic conditions in defense areas should constitute a large part of the total population, perhaps 75 per cent; (2) the dependent and medically indigent group who cannot meet the costs of major illness. About one half of this latter group will be local residents and their care should be a local responsibility. There will remain approximately one hundred and ninety thousand persons who because of residence laws are excluded from such public assistance as the community affords and for these the federal government should make necessary provisions.

In addition to accommodations for bed patients there should be facilities for ambulatory or outpatient care and for public health services. These facilities may be provided through the hospital or may be developed separately. Even in communities where bed accommodations are relatively well provided, outpatient and public health facilities may be very inadequate.

Information available indicates that roughly one million, five hundred thousand civilians will move into extracantonment and newly developed industrial areas. To provide hospital accommodations for this group will require six thousand three hundred new beds.

Approximately one hundred and twenty health center buildings are needed to provide suitable accommodations for health departments and outpatient clinics.

The House Committee on Public Buildings and Grounds had taken no action on this bill at the time this report was completed.

Tax on Alcohol Used in Medicinal Preparations.—Representative Kefauver, Tennessee, has introduced a bill, H. R. 3383, pending in the House Committee on Ways and Means, proposing to reduce from \$3 to \$2 the federal tax on each proof gallon or wine gallon when below proof of ethyl alcohol used exclusively for manufacturing medicinal preparations, flavoring extracts, flavors and for other nonbeverage purposes.

Medical Aid for Transients.—A pending bill, H. R. 161, introduced by Representative Voorhis, California, referred to the House Committee on Ways and Means, proposes to amend the Social Security Act by adding a new title under which grants may be made to the states for aid to transients. To enable each state to furnish financial assistance or other assistance, including but not limited to medical, dental and mental aid, to needy transients, the bill proposes a federal appropriation for the fiscal year ending June 30, 1942, the sum of \$10,000,000 and thereafter for each fiscal year a sum sufficient to carry out the purposes of the bill.

Veterans' Hospitals.—Several bills are pending proposing either to construct new veterans' hospitals or to enlarge existing facilities. All the bills are pending in the House Committee on World War Veterans' Legislation with the exception of a Senate

bill, which is pending in the Senate Committee on Finance. H. R. 149, introduced by Representative Tenerowicz, Michigan, proposes a federal appropriation of \$250,000 to construct, for the accommodation of 250 bed patients, an addition to the veterans' administration hospital in Dearborn, Mich.; H. R. 549, introduced by Representative Merritt, New York, proposes an appropriation of \$1,875,000 to construct a general medical-surgical veterans' hospital and domiciliary facility at Whitehall, N. Y., with a capacity of at least six hundred beds; H. R. 1421, introduced by Representative Pace, Georgia, proposes an appropriation of \$2,500,000 to construct a veterans' hospital for the southwest section of Georgia, with a capacity of at least eight hundred beds; H. R. 2245, introduced by Representative Cluett, New York, proposes an appropriation of \$4,050,000 to construct a veterans' general medical and surgical hospital and domiciliary facility in one of the counties of Rensselaer, Saratoga, Warren or Washington, in the state of New York, with a capacity of at least one thousand two hundred beds; H. R. 1633 and H. R. 2613, introduced by Representative Sheppard, California, propose an appropriation of \$500,000 to construct a veterans' hospital, primarily for treatment of diseases of the chest, in San Bernardino or Riverside County, Calif.; H. R. 2488, introduced by Representative Bradley, Michigan, proposes a federal appropriation of \$700,000 to construct a veterans' hospital, with a capacity of one hundred and fifty beds, in or near the city of Gladstone, Mich.; H. R. 2510, introduced by Representative Izac, California, proposes an appropriation of \$1,000,000 to construct a veterans' hospital, with a capacity of at least two hundred beds, in or near the city of San Diego, Calif.; H. R. 3154, introduced by Representative Rolph, California, proposes an appropriation of \$600,000 to construct a 134 bed patient capacity addition to the veterans' hospital at Fort Miley, San Francisco, and S. 970, introduced by Senator Gurney, South Dakota, proposes a federal appropriation of \$1,000,000 to construct a veterans' hospital and diagnostic center in the first congressional district of South Dakota.

Water Pollution Control.—H. R. 1110, introduced by Representative Spence, Kentucky, and H. R. 3778, introduced by Representative Mundt, South Dakota, both pending in the House Committee on Rivers and Harbors, contemplate the establishment in the United States Public Health Service of a Division of Water Pollution Control to prepare comprehensive plans for eliminating or reducing the pollution and improving the sanitary conditions of the navigable waters of the United States and streams tributary thereto. These bills provide that federal loans or grants will be made available for the construction of necessary treatment works.

Animal Experimentation.—H. R. 3871, introduced by Representative Burdick, North Dakota, provides that it shall be a misdemeanor for any person to experiment or operate in any manner whatever on any living dogs in the District of Columbia, for any purpose other than the healing or curing of the dog. Any person convicted of a violation of this prohibition will be subject to a fine of not less than \$100 nor more than \$500, or imprisonment for not less than three months nor more than one year, or both such fine and imprisonment. This bill is pending in the House Committee on the District of Columbia.

STATE LEGISLATION

During the year the Bureau, as it has done in past years, followed the trend in state legislation of medical interest. Information that seemed of importance was transmitted promptly to the president, the secretary and the chairman of the legislative committee of the state medical society of the state concerned. Abstracts of bills of medical interest were prepared for publication in THE JOURNAL so that physicians generally might be promptly advised concerning legislative developments in their own states. At the close of the calendar year a summary of legislation of interest to physicians considered by state legislatures in 1940 was prepared, and this summary was published in THE JOURNAL, April 5, 1941.

During 1940 the legislatures of Kentucky, Louisiana, Mississippi, New Jersey, New York, Rhode Island, South Carolina and Virginia met in regular session. Alabama also met in regular session because its legislature, which met in regular session in 1939, recessed to convene for a few days in 1940.

Special legislative sessions were held in Arizona, California, Illinois, Louisiana, Maine, Missouri, Nebraska, New Mexico, New York, Ohio, Pennsylvania and Vermont. On the whole, comparatively little legislation of medical interest was considered in the sessions referred to, the sessions being, from a medical point of view, the lightest observed during the period of twelve years in which the Bureau has undertaken to survey state legislative endeavors and accomplishments. Reference will be briefly made to some of the more important laws enacted by several states.

Medical and Hospital Service Plans.—A law was enacted in New Jersey authorizing the formation of medical service corporations, to operate on a prepayment basis nonprofit medical service plans whereby stated medical services and care may be rendered at the expense of the corporations to subscribers to such plans and to their dependents. This law contemplates that the subscriber to any plans operated by the medical service corporation shall have available the services of the physician of his own choice and that the corporation itself will pay that physician. A roughly similar law was enacted in Virginia except that under the Virginia law the plans to be offered subscribers may comprehend medical services alone, hospital services alone or both medical and hospital services. Such plans may be offered (1) through the medium of a nonprofit corporation, (2) by a group of physicians representative of the medical profession in the community or territory in which the service contracts are offered or (3) by a particular hospital or combination of hospitals.

Free Medical Care for Recipients of Old Age Pensions.—The electorate of Washington adopted in the November general election an initiative measure cited as "Senior Citizens Grants Act," which authorizes grants of \$40 monthly to persons of 65 or over without adequate resources, as defined in the measure. The measure also requires that such persons shall be provided at the expense of the state "medical, dental, surgical, optical, hospital and nursing care by a doctor of recipient's own choosing."

Prenatal and Antepartum Examinations.—The Kentucky law prohibiting the issuance of a license to marry unless each party to the proposed marriage presents a physician's certificate as to freedom from all venereal diseases was so amended in 1940 as to require the certificate to state only that the party is free from any stage of syphilitic infection which is or is likely to become communicable. A new Virginia law conditions the issuance of a license to marry on a presentation by each party of a certificate signed by a licensed physician that as to such person such tests and examination have been made and such medical history obtained as to enable the physician to determine whether or not there is evidence of syphilis, but the certificate is not to disclose any medical findings. The examining physician when he finds indication as to syphilis in a particular person must inform that person and the prospective marital partner as to the result of his findings and the possibility of transmitting the disease to the other party and to their children. The presence of syphilis, however, is not to be a legal bar to the marriage, but if the parties marry they are deemed to have agreed to take such treatments and such precautions as may be prescribed by the state health commissioner.

Another new Kentucky law requires a physician or other person legally permitted to attend pregnant women to take or cause to be taken a specimen of blood for serologic tests for syphilis as soon as engaged to attend the woman. A new Louisiana law imposes a similar duty on physicians and other persons attending pregnant women if no objection is made by the woman.

Barbituric Acid.—A law was enacted in Mississippi restricting the sale and distribution of certain barbiturates to sale or distribution on the written prescription of a licensed physician, dentist or veterinarian.

Healing Arts Practice Acts.—A basic science law was enacted in Rhode Island which will require all applicants for licenses to practice any form of the healing art in that state to demonstrate to a state board of examiners in the basic sciences a comprehensive knowledge of anatomy, physiology, pathology, chemistry and bacteriology before presenting themselves to their respective professional boards for examination and licensure.

No particularly noteworthy changes were made in 1940 in the medical practice acts of the several states. Proposals were defeated in several states to enact separate chiropractic or naturopathic practice acts. The osteopathy act of Rhode Island was amended by striking out the specific limitation with respect to the use of drugs.

COOPERATION APPRECIATED

Again the Board of Trustees, on behalf of the Bureau, wishes to express sincere appreciation for the ready cooperation received during the year from constituent associations, from component societies and from individual physicians.

Summary

Laws Regulating the Use of Barbiturates.—As of May 1, 1940 twenty-seven states had enacted laws tending to discourage the promiscuous use of the barbiturates. In twenty-five of these states, sales of such drugs are limited to sales on prescription.

Exempt Narcotic Preparations.—The Commissioner of Narcotics reports that the section in the Uniform Narcotic Drug Act dealing with the so-called exempt preparations constitutes a loophole through which addicts obtain narcotics to satisfy their craving for the drugs. He proposes an amendment to the law to end this source of supply.

Court Decisions of Medical Interest.—The Report of the Committee on Medicolegal Blood Grouping Tests was relied on by the United States Court of Appeals for the District of Columbia as sufficient authority to establish the scientific soundness of blood grouping tests in cases of disputed paternity. In Florida, an indictment of a chiropractor for manslaughter who withdrew insulin from a diabetic patient, death ensuing, was upheld. Kansas and Georgia osteopaths were denied the right to register under the Harrison Narcotic Act. In Florida, the right of the governing board of a municipal hospital to deny to osteopaths the right to practice in the institution was upheld. In Ohio and Pennsylvania, osteopaths were held to be "licensed physicians" within the meaning, respectively, of the state laws defining eligibility for the office of coroner and regulating the use of narcotics. In Pennsylvania the right of the unions to unionize hospital employees was denied.

Model Vital Statistics Act.—The United States Bureau of the Census has formulated a draft of a model vital statistics act suitable for enactment by the several states. The draft has not been given final approval by the National Conference of Commissioners on Uniform State Laws.

Cadavers for Teaching Purposes.—A decline during the last several years in the number of cadavers that have been made available under the anatomical acts of the several states is causing concern. The decline is attributed, in many instances, to the fact that relief funds have provided means for burial of many bodies that otherwise would be distributable under the anatomical acts.

Consultation Service by Mail.—The Department of Justice of Pennsylvania rendered an important decision involving a proposed plan to utilize the facilities of the Institute for the Control of Syphilis at the University of Pennsylvania for consultations by mail in connection with the operation of the state laws relating to premarital examinations and to the control of the venereal diseases. The opinion discussed both the ethical character of the proposed plan and the personal liability of the consultants.

Federal Legislation.—No measure of primary medical importance was enacted by the Seventy-Sixth Congress between the last meeting of the House of Delegates and the expiration of the Congress. Statements emanating from official governmental sources forecast legislation of medical import that will require careful consideration. Beginning with the Seventy-Seventh Congress, the Bureau

inaugurated a Federal Legislative Bulletin service to supply the several state associations with detailed information concerning bills of medical interest in Congress.

Federal participation, financially and otherwise, in plans for the control of industrial diseases, tuberculosis, cancer and dental diseases is proposed by bills pending in Congress.

The establishment of a National Physical Fitness Institute in the Federal Security Agency and the enactment of a National Preparedness Act of 1941 for the improvement of physical and social fitness are contemplated in other bills.

Bills are pending dealing with the deferment of medical students, interns and residents from training and service under the Selective Training and Service Act and with the granting of commissions to physicians. One bill proposes in effect to make eligible for appointment as medical officers in the Army and Navy graduates of unapproved medical schools.

Other bills provide for the appointment of female dietitians and female physical therapy aides in the Army and for the creation of a Chiropody Corps in the Medical Corps of the Army.

The construction of hospitals, the granting of permission to chiropractors to treat beneficiaries of the United States Employees' Compensation Act, the establishment of a federal department of health, inducements to states to embark on combined programs of compulsory and voluntary health insurance, the granting of pensions to contract surgeons of the Spanish-American War, broadening the base of the Social Security Act so as to bring within the old age and survivors insurance benefits the employees of scientific and certain other organizations, the improvement of health in areas adjoining military and naval reservations and plants engaged in defense work, medical aid for transients, a reduction of the tax on alcohol used in medicinal preparations, the construction of additional veterans' facilities and the creation in the United States Public Health Service of a division of water pollution control are contemplated by pending bills.

A pending proposal would make illegal any operation or experiment performed on a living dog in the District of Columbia for any purpose other than the healing or curing of the dog.

State Legislation.—A law was enacted in New Jersey authorizing the formation of medical service corporations, and a somewhat similar law was enacted in Virginia. In the state of Washington, an initiative measure was adopted providing medical, dental, surgical, optical, hospital and nursing care for recipients of senior citizens' grants.

The Kentucky premarital examination law was amended and a new antepartum examination law was passed in that state as well as in Louisiana. In Virginia a premarital examination law was enacted. A law to restrict the sale of barbiturates to sales on prescription was enacted in Mississippi, and a basic science law was enacted in Rhode Island. An amendment to the Rhode Island osteopathic act, striking out the specific limitation with respect to the prescribing of drugs, was enacted.

Bureau of Medical Economics

PREPAYMENT PLANS FOR MEDICAL CARE

The organization of prepayment plans for medical care continued to occupy a prominent place in medical economics during 1940. Although the trend in this movement was definitely in the direction of statewide arrangements sponsored by state medical societies, groups not directly connected with the organized medical profession continued to propagandize for so-called "group medical care," a misnomer sometimes called cooperative medicine. A new type of ward care contract is being sold by some group hospitalization organizations without regard to the patient's financial relationship to his attending physician. In many hospitals the attending physicians are not permitted to

charge for their services to ward patients and therefore persons who hold group hospitalization ward plan contracts usually receive both hospital and medical care for the price of the ward contract.

Still other forms of prepaid medical care are being sponsored by the Farm Security Administration and the National Youth Administration with tax funds. These federal programs are not new and are being administered for the benefit of individuals or families who become clients of one or the other of these federal agencies. The extension of the activities of these and other governmental agencies provides assistance to many individuals and indicates an increasing tendency toward the utilization of tax funds in the provision of medical care.

These trends seem to justify two definite observations: First, if voluntary, prepaid medical care is to become and continue economically and scientifically sound, laws to legalize prepaid medical care organizations and procedures should be framed with the greatest care; ethical principles and recognized standards of medical practice should be observed; actuarial data should be collected, consolidated and used as the basis of indicated modifications; expansion to include groups of the population other than employed persons—such as dependents or the agricultural population—should be made only after the most careful study, and prepayment methods of distributing medical care should be recognized as only supplementary to the private practice of medicine.

Second, the medical profession has long advocated recognition of the principle that the complete medical care of the indigent is a responsibility of the community, medical and allied professions and that such care should be organized by local governmental units and supported by tax funds.

Since the indigent constitute a large group in many communities, the necessity for state aid for medical care may arise in poorer communities and the federal government may need to provide funds when the state is unable to meet these emergencies. The medical profession believes, however, that the role of the federal government should be principally that of giving financial and technical aid, when needed, to the states in the development of sound programs to meet their own particular conditions and requirements. The development of medical care programs by federal agencies which insist on retaining administrative control creates a situation which merits the most careful consideration by the medical profession.

The profession has only partially discharged its duty by endeavoring to maintain a high degree of competence among its members. Medical standards and competence can be completely destroyed by unsound methods by which the available services are distributed. Centralization of control and premediated expediencies associated with planned fiscal policies may rapidly achieve deterioration of the quality of medical care. It should continue to be the concern of the medical profession to insist on methods of distribution as well as methods of diagnosis and therapy that will give to the people the best possible medical care.

Any method of distribution of medical services which inhibits, restrains, proscribes or obtrudes by regulation, administrative practice or fiscal arrangement the quality of medical service which could otherwise be made available to the people is dangerous to medicine and to the people it would serve.

SURVEY OF MEDICAL SERVICES AND FACILITIES FOR THE CARE OF CRIPPLED CHILDREN

At the request of Mr. Basil O'Connor, president of the National Foundation for Infantile Paralysis, and with the support of that organization, the Bureau of Medical Economics undertook early in 1940 a survey of funds now available for the care of the crippled, including those provided by the government, the individual states and various philanthropies. To insure completeness of the survey, it was necessary to compile a list of all organizations engaged in some phases of this work. From each agency included, information was obtained with regard to the scope and the nature of its program, the number of crippled children under its care and the amount of money collected for this purpose.

Five types of questionnaires were sent out—those to governmental agencies, private agencies, hospitals, county chapters of

the National Foundation for Infantile Paralysis, and diplomates of the American Board of Orthopedic Surgery.

The material was compiled on a state rather than on an organization basis. All agencies in one state directly or indirectly doing work with crippled children are included under that state heading. For example, under California a section is devoted to a description of the work done and the amount spent by the Crippled Children Services of the State Department of Public Health, the various county (organized and unorganized) chapters of the National Foundation for Infantile Paralysis, the California Society for Crippled Children and other private philanthropies.

The 1939 program of each state tax supported commission is described with regard to the scope of the work, the number of crippled children cared for, the total and average cost for such care, the number and type of cooperating agencies and the need for additional facilities.

Returns from the county Infantile Paralysis Fund organizations are tabulated by separate counties. A number of comments included in these returns are given to show the need for additional funds and facilities and possibly closer supervision of the county units with regard to the use and care of the funds collected. The questionnaires included such items as amount in reserve, number of infantile paralysis victims aided, and whether a direct case working agency was necessary to distribute funds.

The compilation of returns from the diplomates of the American Board of Orthopedic Surgery indicates the extent to which these physicians are giving their services free or on a reduced rate to crippled children case working agencies. Ninety completed questionnaires were returned. The surgeons were asked to estimate the value of their services to their indigent patients in terms of charges made in their private practice. These ninety surgeons attended in 1939 an estimated 40,068 indigent crippled children, while only 10,124 crippled children were cared for in their private practices during the same period of time.

Included also is a summary of the activities of the various Shrine Crippled Children's Hospitals.

Those affiliated agencies of the National Society for Crippled Children which made returns are described under the separate states.

GROUP MEDICAL PRACTICE

A study of group medical practice undertaken in 1940 was actually a recheck and extension of a similar study made in 1933. The purpose of the study was to learn, if possible, the rate of growth—and mortality—of medical groups, the changes, if any, in the locations, sizes, equipment, number and type of specialists and other characteristics and practices of medical groups.

Only those groups were included which had at least three physicians and which pooled their receipts and redistributed them to the members. Closed staff hospitals and diagnostic and industrial groups were excluded. The greatest growth of groups was during the five years 1919-1923 inclusive. Although it is probable that at least half of the groups established during this period have disappeared, the number still surviving is greater than those established or surviving from any succeeding five year period. It would seem that groups were established in this period in localities lacking laboratory, hospital and specialists' services and that as these institutions became more common the motive of group organization lost much of its force.

A total of three hundred and thirty-five groups, more than any previous study had indicated existed in the United States, cooperated in the study to the extent of filling out a questionnaire giving membership and other essential factors. Approximately 33 per cent of the groups had only three members, and more than half had four members or less. The average for all groups was six and two-tenths members. More than one third of the groups were "family" organizations having two or more physicians with the same surname.

Ninety-one per cent of the groups were in cities of less than 250,000 population and 55 per cent in cities of less than 25,000 population. Groups are largely concentrated in or near the Mississippi Valley and in California.

The comments from groups in twenty-one states and from members of defunct groups indicate that there is no financial advantage in group organizations and that the greatest cause of the high mortality is probably internal friction.

There were 2,093 physicians in these groups, of which 507 were specialists who were diplomates of their respective specialty boards, 387 nondiplomates who were members of some special society, and 804 who simply reported themselves as specialists. There were 395 general practitioners. Only seventeen groups reported the use of any type of prepayment contract plan for medical care. In these seventeen groups there were only eighteen physicians who were accredited specialists and only twenty-three physicians who were members of special societies, but these seventeen medical groups reported as specialists 100 of their members who had neither of the foregoing credentials. For comparison there were twenty-six groups having twelve or more members each with no system of prepayment for medical care. These included one hundred and ninety diplomates and eighty-one members of specialist societies, and only one hundred and twenty-seven "reported" specialists.

A wide variety of methods of distributing the pooled income was found, with no apparent tendency to agree on any one method.

Although the American Medical Association and its constituent societies have been charged with opposition to group practice, a search of the Proceedings of the House of Delegates of the American Medical Association for thirty-two years failed to show any action that indicated the slightest hostility to the formation of ethical and capable medical groups. The extent of the participation of group members as officials of the national and state organizations would indicate a complete absence of any such hostility.

MEDICAL PREPAREDNESS

The Bureau of Medical Economics was given the responsibility of conducting a survey of physicians for the Committee on Medical Preparedness and to assemble such other information, not easily obtainable in such a census, that would be of assistance to the Surgeon Generals of the Army, Navy and Public Health Service.

The content and arrangement of the schedule to be used in the census of physicians was approved by the Surgeon Generals of the Army, Navy and Public Health Service.

Mailing of schedules began July 5, 1940 and was completed July 16, 1940. On the first mailing, schedules were sent to the latest known address of 175,140 physicians in the continental United States and 4,878 physicians in the outlying territories and possessions. Since July 16, 4,790 new names of physicians have been added to the United States list and 306 to the outlying territory list. On Dec. 31, 1940 the total number of physicians from whom a Medical Preparedness schedule is desired was, for the United States and outlying territories and possessions, 185,114. The number of schedules that can be used will be reduced by the number of deaths among physicians during the last six months. The statistics quoted in this article can therefore be only approximate for the present.

If the number of physicians in the outlying territories and possessions are separated from those in the continental United States, the number of returns from the physicians in the United States proper on Dec. 31, 1940 was 138,320. This represents a 77 per cent return. The physicians in the outlying territories and possessions returned 1,483 schedules. This represents a 29 per cent return from the 5,184 physicians on this list.

The percentage of returns by states and corps areas shows some variations as indicated in the accompanying table.

The information on Medical Preparedness schedules cannot be easily listed or consolidated from the schedules themselves. Ease of handling of such data can be accomplished by transferring it to punch cards. Accordingly each schedule received is edited, coded and prepared for punch card operations. Before the schedules can be sent for punching, sorting and listing, the data should be complete and accurate.

During the early part of the census large numbers of schedules were incompletely or incorrectly answered. Supplementary schedules were mailed, at first to about 40 per cent of the physicians who had replied, to secure this additional or correct data. This process greatly retarded the progress of the census. However, at present the need for supplementary schedules has been materially reduced.

Of the 139,803 schedules received up to and including Dec. 31, 1940, 115,796 have been prepared for punch cards. These cards

can be sorted for any desired information, and the coding on the sorted cards can be transferred to listing sheets at the rate of eighty a minute. Listings on special sheets have already been prepared. These are only partial listings, since complete lists cannot be secured until a punch card has been made from a schedule from every known physician.

A listing of general practitioners and specialists from the first 47,000 punch cards, arranged according to specialty, indicates

that of those physicians 38.3 per cent were in general practice, 31.5 per cent were devoting special attention to some type of limited practice and 30.2 per cent were limited specialists.

A listing of commissioned officers by states and branches of service compiled from about 95,000 punch cards indicates that 12,604 physicians had reported that they now hold commissions in the medical corps. This number included 812 officers of the regular Army Medical Corps, 443 officers of the Medical Corps of the Navy, 444 officers of the United States Public Health

Service, 9,126 officers of the Army Medical Reserve Corps, 990 officers of the Naval Medical Reserve Corps and 789 officers of the Medical Corps of the National Guard.

A listing of physicians in industrial practice shows by states the names of 465 physicians classified in general industrial practice, 1,534 physicians who specialize in industrial surgery, 48 who specialize in preventive medicine in industry, 8 who indicate industrial consultation practice and 5 who specialize in industrial toxicology. These lists were compiled from a total of about 95,000 punch cards and are not complete.

All these listings are only preliminary and are intended to give the Surgeon Generals of the Army, Navy and Public Health Service as much data as are available until complete listings can be made later in the census.

A special listing sheet for public health has just been approved by the Surgeon General of the Public Health Service.

The purpose of the census is to secure and to arrange in useful forms complete and accurate data pertaining to all physicians in the United States. There are three fields for which preparation to supply necessary medical services must be made: the armed forces, expanding industry and the civilian population. A knowledge of the number, age, location, qualifications, availability and other characteristics of the entire medical profession is essential in order that the total personnel resources can be utilized in intelligent preparation, appropriate assignment and adequate services for each of the three groups just mentioned. It is therefore of the greatest importance that every physician regardless of age, type of practice, military experience, personal, professional or other factors send to the Committee on Medical Preparedness a questionnaire accurately and completely answered.

The medical profession by education, experience, tradition and moral obligation is prepared to accept now, as it has in the past, the protection of the health of all the people whether in the military establishment or in the civilian population. The completion and maintenance of a complete and accurate census of physicians is essential in the preparation for an orderly, prompt and efficient medical service.

Summary

Prepayment Plans for Medical Care.—The organization of prepayment plans for medical care continued to occupy a prominent place in medical economics during 1940. A new type of ward care contract is being sold by some group hospitalization organizations without regard to the patient's financial relationship to his attending physician. Persons holding group hospitalization ward plan contracts usually receive both hospital and medical care for the price of the ward contract, since in many hospitals attending physicians are not permitted to charge for services to ward patients.

Other forms of prepaid medical care are being sponsored by the Farm Security Administration and the National Youth Administration with tax funds. The extension of the activities of these and other governmental agencies indicates an increasing tendency toward the utilization of tax funds in the provision of medical care. The development of medical programs by federal agencies which insist on retaining administrative control creates a situation that merits the most careful consideration by the medical profession. Medical standards and competence can be completely destroyed by unsound methods by which the available services are distributed. Any method of distribution of medical services which inhibits, restrains, proscribes or obtrudes by regulation, administrative practice or fiscal arrangement the quality of medical service which could otherwise be made available to the people is dangerous to medicine and to the people it would serve.

Survey of Medical Services and Facilities for the Care of Crippled Children.—At the request and with the support of the National Foundation for Infantile Paralysis, the Bureau early in the year undertook a survey of all funds now available in the United States for the care of the crippled. Questionnaires were sent to governmental and private agencies, to hospitals, to county chapters of

the National Foundation for Infantile Paralysis and to diplomates of the American Board of Orthopedic Surgery. The compilation of information obtained through returned questionnaires shows the scope of the work done, the number of crippled children cared for, the total and average cost of such care, the number and type of cooperating agencies and the need for additional facilities, as well as the extent to which physicians in private practice are giving their services free or at a reduced rate to crippled children case working agencies. Also included in the compilation is a summary of the activities of the various Shrine Crippled Children's Hospitals.

Group Medical Practice.—A study of group medical practice which actually was a recheck and extension of a similar study made in 1933 was undertaken in 1940 in order to learn, if possible, the rate of growth and mortality, and the changes, if any, in locations, sizes, equipment, number and type of specialists as well as other characteristics of medical groups. Only those groups were included in the study which had at least three physicians, pooled their receipts and redistributed them to members. Three hundred and thirty-five groups, more than any previous study had indicated existed in the United States, cooperated in this study. Comments received from members of active and defunct groups indicate that there is no financial advantage in such group organizations and that the greatest cause of the high mortality is internal friction. Only seventeen of these groups reported the use of any type of prepayment contract plan for medical care. Although the American Medical Association and its constituent societies have been charged with opposition to group practice, a search of the Proceedings of the House of Delegates of the American Medical Association for thirty-two years failed to show any action that indicated the slightest hostility to the formation of ethical medical groups.

Medical Preparedness.—The Bureau of Medical Economics was given the responsibility of conducting a survey of physicians for the Committee on Medical Preparedness and to assemble such other information, not easily obtainable in such a census, that would be of assistance to the Surgeon Generals of the Army, Navy and Public Health Service. The content and arrangement of the schedule used in the census of physicians was approved by the three Surgeon Generals.

The first schedules were mailed on July 5, 1940 to the latest known address of 175,140 physicians in the United States and to 4,878 physicians in the outlying territories and possessions. Since July 16, when the first mailing was completed, 4,790 new names of physicians have been added to the United States list and 306 to the territorial list, so that the total number of schedules mailed as of Dec. 31, 1940 was 185,114. On Dec. 31, 1940 the number of schedules returned by physicians in the United States was 138,320, or 77 per cent, and the number received from physicians in the territories and possessions was 1,483, or 29 per cent.

In order that information on medical preparedness schedules may be more easily listed and consolidated, the data obtained are being transferred to punch cards, but before this can be done each schedule received must be edited and coded and the data checked for completeness and accuracy. It was necessary during the early part of the census to mail supplementary schedules in order to obtain additional or correct information. Of the 139,803 schedules received up to and including Dec. 31, 1940, 115,796 have been prepared for punch cards which can be sorted for any desired information and the coding transferred to listing sheets. Listings on special sheets have already been prepared.

The purpose of the census is to secure and to arrange in useful forms complete and accurate data pertaining to all physicians in the United States. There are three fields for which preparation to supply necessary medical services must be made: the armed forces, expanding

industry and the civilian population. A knowledge of the number, age, location, qualifications, availability and other characteristics of the entire medical profession is essential in order that the total personnel resources can be utilized in intelligent preparation, appropriate assignment and adequate services for each of the three groups just mentioned. It is of the greatest importance that every physician regardless of age, type of practice, military experience, personal, professional or other factors send to the Committee on Medical Preparedness a questionnaire accurately and completely answered. The completion and maintenance of a complete and accurate census of physicians is essential in the preparation for an orderly, prompt and efficient medical service.

Bureau of Investigation

The Bureau of Investigation continues to play a most active part in the educational activities of the American Medical Association. It supplies information concerning "patent medicines," quacks, frauds, fakes and faddists to physicians, laymen, government agencies, Better Business Bureaus, business corporations, newspapers, radio stations and high school and college students who are making studies of such subjects.

EFFECT OF NEW FEDERAL LEGISLATION

The enactment of new federal legislation concerning "patent medicines" and cosmetics has not greatly affected the number of inquiries received by the Bureau, in spite of the fact that these regulations require the declaration of the active ingredients of such preparations and the inclusion of warning statements on some items. This is due largely to the fact that additional reforms in the "patent medicine" and cosmetic industries are still needed. Once again it is predicted that after these industries have become accustomed to the new stipulations and their limiting effects, some of them will attempt to evade or circumvent these stipulations. Any weaknesses in the law will become evident as time passes, and the Bureau will be called on to supply information to the same if not to a greater extent than in the past.

Of major importance is the fact that the new law requires quantitative declarations of only a few drugs, and therefore it is still difficult even for physicians to express an opinion about such remedies. The declaration of active ingredients does lessen the number of requests which the Bureau makes of the Chemical Laboratory for analysis of many items which are to be subjects of reports.

COOPERATION WITH GOVERNMENTAL AGENCIES

The Director has spent much more time than in preceding years with representatives of various federal agencies, at their request. At the top of this list is the Federal Trade Commission, followed in order by the Food and Drug Administration, the Post Office Department, the Federal Bureau of Investigation and the Treasury Department.

CLASSIFICATION OF INQUIRIES

In the annual report of the Bureau for 1938 it was pointed out that the increasing number of letters from students was of special significance, first because of the age of those requesting the information and second because of the fact that much of the information is passed on to other students. In the annual report for 1939 the inquiries from students totaled only 12 per cent, whereas during 1940 inquiries from students and teachers represented 40 per cent of the total. About 25 per cent of the inquiries were received from physicians and 25 per cent from laymen not otherwise classified. The remainder of the inquiries were about equally divided between Better Business Bureaus, government agencies, newspapers and radio stations.

The principal subjects of the inquiries received by the Bureau in addition to general inquiries were concerned with a popular antacid containing aspirin, a widely advertised line of remedies for colds, an "epilepsy cure," aspirin, a mouth gargle, a "pain killer," a liver pill, a blood pressure treatment, a cancer treatment, a reducing candy, a soft drink, an antacid and two laxatives. The leading subjects represent less than 25 per cent of the total number of subjects inquired about (12,053).

PUBLICATION

The Bureau contributed thirty-one articles to THE JOURNAL during 1940. This material totaled sixty-six and one-half columns in addition to one hundred and twenty-eight paragraphs dealing with Notices of Judgment, as compared with fifty-four columns in the preceding year and thirty-four and one-half columns for each of the three years preceding 1939. Worthy of note is the fact that 50 per cent of the material published in 1940 dealt primarily with individuals rather than with products, whereas in the four preceding years articles about individuals represented only about one third of the total. The former Director of the Bureau, Dr. Arthur J. Cramp, has prepared some of the reports that have been published. Many of the articles based on fraud orders were prepared by the Assistant Director, Mr. B. O. Halling.

During the year three thousand, seven hundred and thirty pamphlets issued by the Bureau were distributed. A new pamphlet entitled "Cosmetics," which will replace the older "Cosmetics and Allied Preparations," has been prepared and is now on the press. Three additional new pamphlets to replace older issues are in process of preparation.

Lantern slides provided for the use of physicians were revised and a film strip of the revised slides was prepared.

FIELD WORK

The Director of the Bureau during 1940 made twenty-seven talks and addresses to lay audiences and professional groups under the sponsorship of medical societies, of local woman's auxiliaries and of a number of other groups. Fourteen of these addresses were given in the Chicago area and the remainder in Milwaukee, St. Joseph, Mo., Superior, Wis., Springfield, Mo., and Topeka, Kan.

Summary

The Bureau of Investigation has maintained its work, which was first instituted in 1906, by supplying information to the profession and to the public by means of correspondence, by addresses by the Director and by providing slides and film strips for the use of physicians and educators in their contacts with the public.

The work of preparing material for publication in THE JOURNAL increased during 1940, and the relationships of the Bureau with various official agencies of the federal government have been augmented.

Bureau of Exhibits

The work of the Bureau of Exhibits covered a diversified number of activities in 1940, the Scientific Exhibit at the New York session, Association exhibits at various fairs and expositions, the New York World's Fair, exhibits at different museums and motion pictures.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit is administered under the supervision of the Committee on Scientific Exhibit of the Board of Trustees. For purposes of advice and assistance, there is an advisory committee of seven members appointed by the Board of Trustees and a further advisory group of sixteen physicians representing the sixteen sections of the Scientific Assembly and appointed by the respective sections. Numerous individuals also are called on for suggestions from time to time as problems arise.

The Scientific Exhibit continued at the New York session to fulfil its function as an instrument of graduate medical education. The caliber of the exhibits presented, the perseverance and energy of the demonstrators under trying conditions, the interest and enthusiasm displayed by the great number of visitors that filled the hall throughout the week, all indicated the value to the advancement of scientific medicine of this method of presentation.

Applications for space numbered nearly five hundred, half of which it was necessary to refuse because of the limitations of the hall. The selection of applications under such circumstances is a most difficult task.

The fifteen sections of the Scientific Assembly in 1940 were represented by groups of exhibits dealing with the various specialties, which, together with a group of exhibits on anes-

thesia and an exhibit symposium on heart disease presented in cooperation with the American Heart Association, totaled two hundred and forty-three exhibits.

Motion pictures were shown in many of the booths, supplementing the exhibit material which they contained. In addition, three of the sections presented motion picture programs simultaneously and continuously throughout the week in areas adjoining the exhibits of those sections.

Three special exhibits were sponsored by the Board of Trustees. The special exhibit on fractures was shown for the tenth time and continued to be a popular feature. A folder containing the essential points of information was distributed to visitors. The exhibit was presented under the auspices of a committee headed by Dr. Kellogg Speed, Chicago, and the assistance of the Surgeon General of the Army added materially to its success.

The special exhibit on lame backs, shown for the first time, was prepared under the auspices of a committee of which Dr. Frank R. Ober, Boston, was chairman.

The special exhibit on fresh pathologic material was shown in cooperation with the Section on Pathology and Physiology under the guidance of a committee headed by Dr. Harrison S. Martland, Newark, N. J.

Awards and citations were made to thirty-one exhibitors. The Committee on Awards, of which Dr. Fred D. Weidman, Philadelphia, was chairman, worked diligently and long in considering the relative merits of the large amount of excellent material presented.

ASSOCIATION EXHIBITS

Association exhibits depicting the activities of the Association and similar subjects fall into two groups—strictly scientific subjects for medical societies and popular exhibits for fairs and expositions.

There are now available forty-six exhibits for loan to state and county medical societies and to other organizations approved by the component county or constituent state medical societies. During the past year three exhibits were discontinued and ten new exhibits added. On seventy-six occasions, exhibit material was sent out to twenty-seven states. Sometimes more than one exhibit was included in the shipment, thus making a total of one hundred and forty-one units sent out during the year. The average showing lasted from three or four days to a week, but on several occasions the time was extended to a month or more. Because of previous reservations, many requests had to be refused. Numerous other requests were received for exhibits which the Association did not have. Schools especially made requests which could not be filled. A list of exhibits published in *THE JOURNAL* toward the close of the year resulted in a flood of requests for 1941.

Responsibility for installation and demonstration of the Association exhibits rests largely with the groups which borrow the material. The Director of the Bureau finds it impossible to attend more than a very few of the meetings to which material is sent.

NEW YORK WORLD'S FAIR

The American Medical Association again participated in the New York World's Fair with its exhibit on "Medical Education." Few changes were made from the 1939 presentation of this exhibit, except to overhaul and replace exhibits that were worn out.

The 1940 fair opened on May 11 and closed on October 27, a total of one hundred and seventy days. During this period, half a million people visited the booth of the American Medical Association, spending from a few minutes to half an hour or more. An attendant was constantly on hand to demonstrate the exhibit and to answer questions. A further service to the visitor was the opportunity to write, on a blank provided for the purpose, requests for information to be sent from the American Medical Association headquarters. Two thousand, two hundred and sixty-five persons took advantage of this. The questions were answered by the Bureau of Health Education.

An interesting observation on the eagerness of the public for information concerning medical education and qualifications of physicians was the extent to which the set of files on medical schools was used. These were so popular that they had to be replaced twice during the season.

Other contributions of the American Medical Association to the New York World's Fair were the murals in the Medicine and Public Health Building and the *HYGEIA* exhibit in the Infant Incubator Building.

MUSEUMS

The House of Delegates at the New York session passed a resolution urging the support of health museums. During the year a considerable number of communities have sought advice or assistance in this matter. It is apparent that museums are becoming a potent factor in health education.

The Chicago Museum of Science and Industry was the recipient of a considerable amount of exhibit material shown in 1939 at the Golden Gate International Exposition. These exhibits, together with some of those shown at A Century of Progress in Chicago, made a large showing for the American Medical Association. A question and answer service was conducted for the benefit of those who wished specific information from the American Medical Association. The answers were sent out by mail by the Bureau of Health Education. During the year, the museum completed its building program and opened all exhibits to the public. The attendance for the year was five hundred and sixteen thousand, six hundred and forty-eight.

The American Museum of Health in New York was the recipient of the exhibit on "Medical Education" shown by the American Medical Association at the New York World's Fair. The American Museum of Health is now in the process of installing its exhibits in a permanent location in one of the buildings on the fairgrounds. It will be opened to the public in the near future.

The Cleveland Health Museum opened in November with a considerable number of loan exhibits from the American Medical Association on display. This material will be changed from time to time as occasion demands. Among other features is an exhibit on *HYGEIA*, the Health Magazine, with a question and answer service for visitors.

MOTION PICTURES

In accordance with the action of the House of Delegates in 1937, the Bureau has continued to furnish information concerning motion pictures. The demand is constant and urgent and has become a major problem for the Bureau. There are twenty-two films in the loan collection, only three of which are suitable for lay audiences. No new films have been added during the year.

The films have been sent out on one hundred and eighty occasions to thirty-five states, to the District of Columbia and to Canada. In many instances two or three pictures were sent, making a total of three hundred and twenty-five pictures. Often the pictures were shown to several audiences before they were returned.

Many hundreds of letters inquiring about sources of motion pictures on particular subjects which cannot be filled from the loan collection are received.

PUBLICATIONS

Several publications of the Bureau have continued to be popular. The *Primer on Fractures* is in its fourth edition. Thousands of copies of the pamphlet on poliomyelitis have been distributed, and it is now in the process of another revision. The pamphlet on varicose veins is likewise being revised for a new edition. The manuscript for a pamphlet on anesthesia has been prepared and is ready for printing. The exhibit committee on lame backs has prepared for an early printing a pamphlet on lame backs.

Summary

The Scientific Exhibit at the New York session included two hundred and forty-five exhibits and three groups of motion pictures. There were special exhibits on fractures, lame backs and fresh pathologic material, and exhibit symposiums on heart disease and anesthesia.

Association exhibits, dealing with the activities of the Association, number forty-six. They were shown one hundred and forty-one times in twenty-seven states.

The exhibit of the American Medical Association on "Medical Education" shown in the Medicine and Public Health Building at the New York World's Fair attracted

half a million visitors, while the Hygeia exhibit in the Infant Incubator Building attracted many thousands more.

Museums have been the recipients of exhibit material from the American Medical Association, especially the Chicago Museum of Science and Industry, the American Museum of Health and the Cleveland Health Museum.

The twenty-two motion pictures in the film collection of the Association have been sent out three hundred and twenty-five times and shown in thirty-five states, the District of Columbia and Canada.

The publications of the Bureau are in constant demand and are revised at intervals sufficiently frequent to keep them up to date.

Committee on American Health Resorts

The Committee on American Health Resorts held one meeting during the annual session of the American Medical Association in New York in June 1940 and a second meeting at Association headquarters in January 1941.

The Committee records with regret the death of its Chairman, Dr. Bernard Fantus. Dr. W. S. McClellan was designated as Acting Chairman.

The early part of the year was spent in the development of a questionnaire to be sent to health resorts. On July 1 an employee was transferred from the Bureau of Health Education to handle the office work for the Committee, and Dr. W. W. Bauer, Director of the Bureau of Health Education, was assigned to supervision of this work without membership on the Committee.

The first problem was to ascertain the probable location of health resorts in the United States. All literature and listings were out of date and, in many instances, out of print. A mailing list, therefore, was developed from listings furnished by the American Congress on Physical Therapy together with information derived from government publications, textbooks, the United States Travel Bureau, state health departments, road maps, advertising pages and articles from medical journals, lay magazines and newspapers, postal guides, tourist guides and miscellaneous sources.

It was necessary to query ninety-four chambers of commerce, seventy-five component county medical societies and eighteen county health officers concerning two hundred and thirty-five localities where springs were reputed to exist. In many instances the supposed springs are not used, do not exist or are unknown to those to whom inquiries were directed.

Six hundred and six questionnaires were sent out, of which two hundred and seventeen were returned as of Dec. 31, 1940. In the effort to get more complete returns, four hundred and forty-one follow-up letters were sent, and thirty-one institutions received second questionnaires to replace originals lost or misplaced.

Questionnaires particularly planned to ascertain the extent of health department supervision over health resorts and mineral waters were sent to all state and territorial health departments.

A Committee bulletin has been sent out in six issues, two in July, two in August, one in October and one in November. These bulletins comprised fifty-eight single spaced typewritten pages and were circulated, in addition to members of the Committee, to Association departments whose functions appear to touch on the question of health resorts, namely the Council on Pharmacy and Chemistry, the Council on Medical Education and Hospitals, the Council on Physical Therapy, the Bureau of Investigation and the Advertising Department.

Thus far the work of the Committee has been exclusively fact finding. The results, based on questionnaires returned, are as follows:

(The classifications are purely tentative. The Committee has not yet formulated any rules by which institutions can be listed or classified.)

Class 1. Institutions which employ mineral waters and/or mud for treatment purposes (these may also employ mineral waters for therapeutic drinking in addition), one hundred and four.

Class 2. Institutions which employ mineral waters for therapeutic drinking only, nine.

Class 3. Institutions which use the Battle Creek system, or a similar system, plus climate and sunshine as natural resources, no mineral water, and so on, four.

Class 4. Institutions which use the Battle Creek system, or a similar system, and which do not make use of any natural resources, eight.

Class 5. Waters are bottled and sold only, five.

Class 6. Questionnaire sent to hotel or bath house but returned by institution, hospital or other interested party with the information that the springs exist but that neither they nor any other institutions make use of the waters of the spring, six.

Class 7. Resorts at which mineral waters or hot springs are used for pleasure bathing or general drinking, nine.

Class 8. Resorts at which there are no springs and which are purely resort hotels, four.

Class 9. Questionnaires returned unclaimed marked by the post office as "unknown" or "not found," forty-one.

Class 10. Questionnaires returned unclaimed marked by the post office as "closed," "moved," "none in operation" or otherwise, fifteen.

Class 11. Questionnaires claimed by owners or interested parties and returned with information that the institutions were closed, burned or no longer operating as health resorts, eleven.

Class 12. Miscellaneous, one.

The following resolution adopted by the Council on Physical Therapy at its meeting in December 1940 was referred to the Committee on American Health Resorts, and this Committee has submitted recommendations to the Board of Trustees:

Resolved, That measures be taken to expedite consummation of the plans laid to investigate and evaluate the health resorts of the United States, especially in view of the partial emergency which faces the country today;

That the present Committee on American Health Resorts be enlarged to include other branches of the medical profession; viz., men qualified in the fields basic to physical therapy such as a physiologist, and also men qualified to study and evaluate clinical results such as an internist, a cardiologist, an orthopedist and a physical therapist;

That the organization of a separate Council on Health Resorts be deferred and that, as a preliminary step, the matter be placed under the auspices of the three Councils of the American Medical Association already concerned.

The Committee on American Health Resorts is composed of Dr. Walter S. McClellan, Dr. Euclid M. Smith, Dr. M. B. Jarman, Dr. William P. Holbrook and Dr. Frank H. Krusen. Dr. Krusen was appointed to membership on the Committee at the February 1941 meeting of the Board of Trustees.

Advisory Committee on Advertising of Cosmetics and Soaps

The Advisory Committee on Advertising of Cosmetics and Soaps continued to consider those cosmetic preparations which were submitted for advertising in *THE JOURNAL* and *HYGEIA*. The Committee studied the nature of cosmetic preparations and the evidence for claims made for these cosmetics prior to acceptance of the advertising for the products. The Committee also answered inquiries from laymen and physicians with regard to these products.

Although the functions of the Committee continued to be of use to the Association, its work became less essential from the point of view of the public with the enactment of the Food, Drug and Cosmetic Act and the Wheeler-Lea Amendment to the Federal Trade Commission Act. The manufacturers who have requested the right to advertise their products in the publications of the Association have displayed a commendable attitude toward the Committee and apparently are enthusiastic about the ethical promotion of cosmetics, much as were some of the drug manufacturers when the Food and Drug Act was passed in 1906.

The following actions were taken by the Advisory Committee on Advertising of Cosmetics and Soaps in 1940:

The ruling of the previous year that quantitative formulas were required was modified so that manufacturers were merely to submit the quantities of certain ingredients declared in the qualitative formula when such information was essential to the consideration of a product by the referee and the Committee.

A motion was adopted that no claims for cosmetic products would be permitted implying that they nourish the skin, hair, scalp or lips or that they grow hair. No product may be said to go "deep down" into the pores. No cosmetic product may "restore" anything that nature possesses; it may supply or furnish. Lipstick may not be termed "indelible," since this implies permanence.

The use of the phrase "skin foods" has been declared to be contrary to the provisions of the Food, Drug and Cosmetic Act.

The Committee voted that the terms "instantly" and "instantaneous" would not be permitted to describe the action of products in acceptable advertising of deodorants.

The Committee adopted the rule that in radio broadcasting only certain types of references and phrases be permitted in referring to the Committee and to the acceptance of advertising of cosmetics in publications of the American Medical Association.

Since October 1940, pursuant to action taken by the Board of Trustees, the Committee has ceased its function of giving consideration to individual cosmetic preparations but has con-

tinued functioning, as a Committee on Cosmetics, primarily for the purpose of issuing reports for publication in *THE JOURNAL* on cosmetic preparations by class. The first general report of this committee will be available for publication at an early date.

Dr. Paul C. Barton, who served as secretary of the Advisory Committee on Advertising of Cosmetics and Soaps, continues as secretary of the Committee on Cosmetics. He has acted as an adviser to the Association's Advertising Committee in its consideration of cosmetic items and, whenever necessary, has sought the advice of former members of the Committee on cosmetic products which had not had the consideration of the full Committee.

Summary

In accordance with the action of the Board of Trustees, the Advisory Committee on Advertising of Cosmetics and Soaps during the year discontinued the consideration of individual cosmetics and instituted the preparation of general reports on cosmetic preparations for publication in *The Journal* as the reports of the Committee on Cosmetics. The secretary continued in the same capacity for the Committee on Cosmetics and directed consultation with authorities in this field regarding new cosmetic products which were presented for advertising in the publications of the American Medical Association.

Committee to Study Air Conditioning

The Committee to Study Air Conditioning as it is now constituted is composed of the following members: Dr. Carey P. McCord, chairman, Dr. Walter M. Simpson and Prof. C. P. Yaglou.

This committee has outlined a rather comprehensive program involving studies of many of the important phases of the general subject of air conditioning, and it is expected that official reports prepared by the committee will be ready for publication during 1941.

Committee on Conservation of Vision and Prevention of Blindness

In compliance with the provisions of a resolution submitted to the House of Delegates at the New York session by Dr. Arthur J. Bedell, delegate from the Section on Ophthalmology, the following Committee on Conservation of Vision and Prevention of Blindness has been appointed: Dr. Arthur J. Bedell, Dr. S. Judd Beach, Dr. Harry S. Gradle, Dr. Albert C. Snell and Dr. Olin West.

A meeting of this committee is to be held in Cleveland prior to the meeting of the House of Delegates at the annual session in that city, and the committee will no doubt submit a report to the House of Delegates during the session.

Insurance Plans for Indemnity Against the Cost of Sickness and Hospitalization

Because of suggestions emanating from various sources pertaining to the issuance by old line insurance companies of policies which provide indemnity against the cost of sickness and hospitalization, the Board of Trustees, through its official representatives, has conferred with official representatives of certain large insurance companies.

The Board of Trustees knows of no reason why reliable insurance companies should not offer policies to those who wish to secure such protection, provided the insurance can be offered at a reasonable cost and that such benefits as are provided shall be paid not to some third party but to the insured in cash.

The conditions that have obtained have been such as to make it impossible to go into these matters with sufficient thoroughness to justify a complete report to the House of Delegates at this time. It is the intention of the Board of Trustees to pursue the matter further and, if developments seem to make it desirable, to submit a report to the House of Delegates at a later time.

Dr. Irons Successor to Dr. Hayden

At the meeting of the Board of Trustees held in September 1940, Dr. Ernest E. Irons of Chicago was appointed to serve as a member of the Board of Trustees in the place of Dr. Austin A. Hayden, deceased, until the annual session in 1941, in accordance with the provisions of the Constitution and By-Laws of the Association. Dr. Irons was elected to serve as Secretary of the Board of Trustees during the period for which he was appointed as a member. He has long been officially connected with the Association's work as an efficient and capable member of the Council on Pharmacy and Chemistry.

Resolution on Heroin

The resolution on heroin, which was submitted to the House of Delegates at the New York session by Dr. A. A. Herold, delegate from Louisiana, was referred to the Council on Pharmacy and Chemistry, and the Council has reported to the Board of Trustees that the resolution has been given consideration but that it will be some time before a final report can be offered.

Conclusion

In closing this report, the Board of Trustees desires to express its grateful appreciation of the loyalty and efficiency which the more than six hundred members of the working personnel of the Association have exhibited during the past year. Even those employees in the most humble positions have attempted to do their full share in contributing to the fullest possible realization of the accomplishment of the aims and objects of the Association as these are defined in its Constitution.

Respectfully submitted.

ARTHUR W. BOOTH, Chairman.

ERNEST E. IRONS, Secretary.

THOMAS S. CULLEN.

R. L. SENSENICH.

WILLIAM F. BRAASCH.

ROGER I. LEE.

RALPH A. FENTON.

JAMES R. BLOSS.

Report of the Committee on Scientific Research for 1940

During the year fifty-five applications were considered and thirty-three grants were made, amounting to \$10,740. In all cases but one the money was turned over to the financial officer of the institution in which the grantee was working, with the understanding that it would be subject to requisitions by the grantee and that an accurate account of the expenses would be kept. Results of work under fifty-six grants have been published or are in course of publication. The results of work under twelve grants prior to 1940 are being prepared for publication. Under twenty-eight grants given prior to 1940 active work is still in progress, but in several cases reports on results have been published.

TABLE 1.—Financial Statement for 1940

Balance, Jan. 1, 1940.....	\$ 543.63
Appropriation for 1940.....	13,700.00
Refund, grant 410.....	15.85
Refund, grant 434.....	3.97
Refund, grant 443.....	64.01
Refund, grant 506.....	41.77

Refund, grant 540.....	50.00
Refund, grant 543.....	1.84
Refund, grant 551.....	48.04
	<hr/> \$14,631.93

In the case of eight closed grants no results have been published. This failure of publication, the most tangible return from a grant, is due to various reasons. One grantee died before his work was completed. In other cases the work failed to yield results worthy of publication, which may be the outcome of even the best-planned research. In at least certain cases the unpublished results of grant-aided research may prove of

value in other work and may be used in later publications. It should be noted that only relatively small grants are made in support of what seems to be promising individual work, sometimes carried out under limited facilities. Here the significance of a grant as a stimulus to the recipient and to the institution with which he is connected should not be overlooked.

The report shows that on the whole the grants have been used conscientiously and with good results. After a grant has been made, requests are sent at six month intervals for reports on the progress of the work, and with exceptions the response is prompt and satisfactory.

During the year unexpended balances from grants amounting to \$388.30 have been refunded (table 1).

The committee again ventures to recommend that the appropriation for grants in aid of research be continued.

The financial statement for 1940 is presented. Also brief accounts of grants under which work was completed during

GRANTS OF COMMITTEE ON SCIENTIFIC RESEARCH NEW GRANTS—1940

Grant 566: Robert S. Dow, University of Oregon Medical School, \$300, vessels in lesions of multiple sclerosis.

Grant 567: Armand J. Quick, Marquette University, \$275, conversion of prothrombin to thrombin.

Grant 568: Fritz Schiff, Beth Israel Hospital, New York, \$400, serologic classification of Salmonella.

Grant 569: Israel Davidsohn, Mount Sinai Hospital, Chicago, \$400, Thomson panagglutination phenomenon in serum.

Grant 570: William H. Sweet, University of Chicago, \$300, course of nerve fiber tracts of the temporal lobe.

Grant 571: Joseph T. King, University of Minnesota, \$280, antagonistic effect of tissues on the action of sulfanilamide.

Grant 572: Committee on Fluoride Intoxication, University of Chicago, \$750, bone changes due to fluoride intoxication.

Grant 573: Louis N. Katz, Michael Reese Hospital, Chicago, \$250, factors influencing activities of the heart.

Grant 574: A. G. Eaton, Louisiana State University, \$300, absorption and metabolism of amino acids.

Grant 575: Doran J. Stephens, University of Rochester, \$400, changes in the thyroid gland of undernourished guinea pigs.

Grant 576: Edward S. West, University of Oregon Medical School, \$250, solution of vesical calculi.

Grant 577: Alexander H. Levy, University of Oregon Medical School, \$200, collateral circulation for coronary occlusion.

Grant 578: L. G. Meduna, Francis Gerty and V. G. Urse, Loyola University, Chicago, \$500, biochemical phenomena in schizophrenia.

Grant 579: Harry C. Rolnick, Michael Reese Hospital, Chicago, \$200, effect of trauma on the response of the kidney to sudden blockage.

Grant 580: Lawrence W. Smith, Temple University, \$480, "critical" temperature levels of various neoplastic diseases.

Grant 581: Charles G. Johnston, Wayne University, \$285, intestinal obstruction.

Grant 582: Charles W. Greene, Stanford University, \$500, physiology of the coronary system in monkeys.

Grant 583: Ulrich Friedemann, Jewish Hospital of Brooklyn, \$300, genesis of tetanus.

Grant 584: Oscar V. Batson, University of Pennsylvania, \$200, nystagmus.

Grant 585: Howard Curl, University of Tennessee, \$400, roentgenologic study of the normal gallbladder.

Grant 586: Herman Kabat, University of Minnesota, \$300, nervous component in traumatic shock.

Grant 587: Charles F. Code, University of Minnesota, \$100, action of intramuscular injection of desoxycorticosterone and epinephrine in a yellow wax (U. S. P.) mixture.

Grant 588: Owen H. Wangensteen, University of Minnesota, \$450, physiologic basis of surgical treatment of duodenal and gastric ulcers.

Grant 589: Rucker Cleveland, Vanderbilt University, \$400, histology and cytology of endometrium.

Grant 590: David Polowe, Paterson, N. J., \$150, pancreatic function test.

Grant 591: Percival Bailey, University of Illinois, \$500, effects of electrolytic lesions in the periaqueductal gray matter of the Macacus monkey.

Grant 592: Wesley W. Spink, University of Minnesota, \$120, anti-staphylococcal immunity and nutrition of staphylococci.

Grant 593: A. M. Lassek, Medical College of the State of South Carolina, \$300, origin of the pyramidal tract in the monkey.

Grant 594: I. L. Chaikoff, University of California, \$350, phospholipid metabolism and blood regeneration as measured by radioactive phosphorus.

Grant 595: Arthur C. Allen, Mount Sinai Hospital, New York, \$250, effect of chemicals on vegetations of experimental endocarditis.

Grant 596: Israel Davidsohn, Mount Sinai Hospital, Chicago, \$400, bacteriogenic hemagglutination.

Grant 597: David Polowe, Paterson, N. J., \$100, pancreatic function test.

Grant 598: Siegbert Bornstein, Beth Israel Hospital, New York, \$350, epidemiology and serology of American Salmonella.

STATE OF WORK UNDER PREVIOUS GRANTS

1. COMPLETED DURING THE YEAR

Grant 286, 1933: F. H. Pike, Columbia University, \$600, the effects of successive experimental lesions of the nervous system. Pike, F. H.: Cerebellar Symptoms from Unsymmetrical Lesions After Median Longitudinal Section of Decussations of Forel and of the Superior Brachium, *Am. J. Physiol.* **116**: 121, 1936; Motor Effects of Median Longitudinal Incision of the Decussations of Medial Lemniscus and Corticospinal Tracts in the Cat, *ibid.* **119**: 384, 1937; Combined Lesions of the Decussations of the Pyramidal Tracts and of the Medial Lemniscus with Bilateral Vestibular Destruction, *ibid.* **123**: 163, 1938.

Grant 308, 1933: John L. Ulrich, Johns Hopkins University, \$250, the reflex system in the cat. See grant 372, 1935. Ulrich, J. L.: Differences of Potential Not Previously Recognized as Present in Substances, to be published; The Differences of Potential and the Existence of an Electric Current in Tissues, to be published; The Electrical Conditions of Tissues and Organs in the Body for a Standing and a Relaxing Posture of Animals, to be published.

Grant 309, 1933: Carroll L. Birch, University of Illinois School of Medicine, \$300, assay of urine for sex hormone of the anterior pituitary. Birch, G. L.: Hemophilia: Clinical and Genetic Aspects, in Illinois Medical and Dental Monographs, Urbana, Ill., University of Illinois Press, 1937, vol. 1, no. 4; Assay of the Estrogenic Hormone in Hemophilic and Normal Male Urine, to be published.

Grant 337, 1934: James L. O'Leary, Washington University, \$245, Loven reflexes. Bishop, G. H., and O'Leary, J. L.: Pathways Through the Sympathetic Nervous System in the Bullfrog, *J. Neurophysiol.* **1**: 442, 1938; B and C Nerve Fibers, *Am. J. Physiol.* **126**: 434, 1939.

Grant 367, 1935: Robert H. Gault and A. C. Ivy, American Institute for the Deaf-Blind, Evanston, Ill., \$600, mechanical stimulation of the vibratocile organs. See grant 412, 1936. It is planned to publish the results under the general title "Animal Studies in Vibratocile Sensitivity."

Grant 372, 1935: John L. Ulrich, Johns Hopkins University, \$450, cerebral functions in the action of antagonistic muscles. See grant 308, 1933.

- Grant 382, 1935: L. S. Goodman, A. J. Geiger and L. N. Claiborn, Yale University, \$250, antianemic principle. Geiger, A. J.; Goodman, L. S., and Claiborn, L. N.: Effects of Gastro-Intestinal Resections in Swine on the Anti-Anemia Potency of the Liver, *Yale J. Biol. & Med.* **13**: 259, 1940.
- Grant 407, 1936: Ralph I. Dorfman, Louisiana State University, \$250, estrogenic substance in human urine and other estrogenic compounds. Dorfman, R. I.: Estrogenic Substance in Urine, *Science* **92**: 585, 1940; The Comparative Activity of Naturally Occurring Estrogens on the Infantile Rat Uterus and Vagina, *Proc. Soc. Exper. Biol. & Med.* **45**: 494, 1940.
- Grant 412, 1936: Robert H. Gault and A. C. Ivy, American Institute for the Deaf-Blind, Evanston, Ill., \$400, stimulation of vibrotactile organs by mechanical vibrations. See grant 367, 1935.
- Grant 420, 1936: Arthur Knudson, Albany Medical College, \$400, synthesis of cholesterol in the animal body. Sturges, S., and Knudson, A.: Application of the Schoenheimer-Sperry Method to the Determination of Cholesterol and Cholesterol Esters in Tissues, *J. Biol. Chem.* **126**: 543, 1938. Knudson, A.; Ziegler, J. B.; Remp, D. G., and Floody, R. J.: The Influence of Fat on the Metabolism of Sterols in the Rat, *ibid.*, to be published.
- Grant 434, 1936: Wilbert H. McGaw, Western Reserve University, \$500, sound conduction in fractured bones (refund, \$3.97). McGaw, W. H.: Ossesonometry: I. The Use of Percussion-Auscultation in Fractures, to be published.
- Grant 442, 1937: S. J. Crowe, Johns Hopkins University, \$480, physiology of hearing. Walzl, E. M.: The Effect of Chemicals on Cochlear Potentials, *Am. J. Physiol.* **125**: 688, 1939. Walzl, E. M., and Bordley, J. E.: Localization of Cochlear Potentials, *ibid.* **126**: 648, 1939.
- Grant 443, 1937: Ernest Carroll Faust, Tulane University, \$300, epidemiology of trichinosis in New Orleans (refund, \$64.01). Sawitz, W.: Are Postmortem Statistics on Trichinosis Valid for the Living Population? *Am. J. Pub. Health* **27**: 1023, 1937; Studies on Trichinella Spiralis in the New Orleans Area, *Arch. Path.* **28**: 11, 1939. Peres, C. E.: Trichinella Spiralis: II. Incidence of Infection in Hogs and Rats in the New Orleans Area, to be published.
- Grant 448, 1937: Warren H. Cole, University of Illinois College of Medicine, \$500, cholesterol tolerance as an index of hyperthyroidism and study of excretory function of the liver. Wachowski, T., and Joffe, H.: Relationship of the Concentration of Iodine in the Gallbladder to the Roentgen Shadow in Cholecystography, Radiology, to be published. Cole, W. H.; Clark, H., and Womack, N.: Preparation of Cholesterol Emulsion for Intravenous Administration, to be published.
- Grant 452, 1937: G. Albin Matson, Montana State University, \$100, antigenic properties of certain chemical substances. Matson, G. A.: Sensitization of Animals Against Chloroform and Bromoform Substitution Products of Ortho-, Meta-, and Para-Chlorobenzaldehyde, *J. Immunol.*, to be published.
- Grant 453, 1937: L. T. Samuels and C. H. Thienes, University of Southern California, \$300, hypophysis in the metabolism of carbohydrate fat and protein. Samuels, L. T.; Reinecke, R. M., and Peterson, W. E.: The Effect of Nutrition on Mammary Growth After Estradiol Administration to Hypophysectomized Rats, *Proc. Soc. Exper. Biol. & Med.*, to be published. Samuels, L. T., and Cohen, R. F.: The Adrenals and the Mobilization of Stored Fat, to be published.
- Grant 455, 1937: Elizabeth S. Russell, Roscoe B. Jackson Memorial Laboratory, Bar Harbor, Me., \$225, genetics of tumors in the fruit fly. See grant 505, 1938. Russell, E. S.: A Comparison of Benign and "Malignant" Tumors in *Drosophila Melanogaster*, *J. Exper. Zool.* **84**: 363, 1940.
- Grant 467, 1937: B. O. Barnes, Rush Medical College, \$300, extract of adrenals. Cornbleet, T., and Barnes, B. O.: Androgenic Substance and Sweat, *Arch. Dermat. & Syph.* **41**: 654 (April) 1940. Barnes, B.: A Simple Method for Assaying Male Hormone in Urine, *Endocrinology*, to be published.
- Grant 471, 1937: Timothy Leary, Office of Medical Examiner, Boston, \$500, early atherosclerotic processes and relation of cholesterol to neoplastic growth. Leary, T., and Weiss, S.: Dissecting Aneurysm of the Aorta in Experimental Atherosclerosis, *Arch. Path.* **29**: 665 (May) 1940.
- Grant 472, 1937: Margaret Lasker, Yonkers, N. Y., \$200, incidence of pentosuria and fructosuria. Lasker, M.: Essential Fructosuria, *Human Biol.*, to be published.
- Grant 473, 1937: Roy H. Turner, Tulane University, \$400, physiology of blood vessels in man. See grant 555, 1939. Isbell, H.: The Human Finger Tip: Surface Area and Volume Correlations, *Human Biol.* **11**: 536, 1939. Turner, R. H.: Studies in the Physiology of Blood Vessels in Man: V. A Microphone Sphygmograph, to be published. Studies in the Physiology of Blood Vessels in Man: VI. A Plethysmographic Method for Measurement of Blood Flow in the Finger Tip, to be published; Studies in the Physiology of Blood Vessels in Man: VII. A Protractor Nomogram for the Measurement of Plethysmographic Records, to be published; Studies in the Physiology of Blood Vessels in Man: VIII. The Use of Jewel Bearing Pinion and Brass Bellows in Recorders for Vascular Studies, to be published; Studies in the Physiology of Blood Vessels in Man: IX. The Rate of Blood Flow in the Distal Segment of the Human Finger, to be published.
- Grant 477, 1937: Irving J. Wolman, University of Pennsylvania, \$335, lipid pneumonia. See grant 517, 1938. Wolman, I. J., and Bayard, A. B.: The Pathology of Experimental Aspiration Pneumonia in Rabbits, to be published.
- Grant 483, 1937: J. M. Johlin, Vanderbilt University School of Medicine, \$250, attenuation of toxins by interfacial adsorption. Johlin, J. M.: Attenuation of Toxins by Interfacial Adsorption, *Proc. Soc. Exper. Biol. & Med.* **38**: 568, 1938; Acceleration of Formal Detoxification of Staphylococcus Toxin by Adsorption, *ibid.* **41**: 135, 1939.
- Grant 492, 1938: Solomon Strouse and B. O. Raulston, University of Southern California, \$500, sodium-potassium relationship in diabetes. Strouse, S.; Buell, F.; Kay, R., and Drury, D.: Sodium and Potassium Salts in the Treatment of Experimental and Human Diabetes Mellitus, *J. Nutrition*, to be published.
- Grant 491, 1938: Charles G. Johnston, Wayne University College of Medicine, \$660, intestinal obstruction. See grant 581, 1940. Abbott, W. O., and Johnston, C. G.: Intubation Studies of the Human Small Intestine: X. A Nonsurgical Method of Treating, Localizing and Diagnosing the Nature of Obstructive Lesions, *Surg., Gynec. & Obst.* **66**: 691, 1938. Johnston, C. G.; Penberthy, G. C.; Noer, R. J., and Kenning, J. C.: Decompression of the Small Intestine in the Treatment of Intestinal Obstruction, *J. A. M. A.* **111**: 1365 (Oct. 8) 1938. Noer, R. J., and Johnston, C. G.: Decompression of the Small Bowel in Intestinal Obstruction, *Am. J. Digest. Dis.* **6**: 46, 1939. Lofstrom, J. E., and Noer, R. J.: The Use of Intestinal Intubation in the Localization of Lesions of the Gastrointestinal Tract, *Am. J. Roentgenol.* **42**: 321, 1939. Penberthy, G. C.; Johnston, C. G., and Noer, R. J.: The Treatment of Adynamic Ileus by Gastrointestinal Intubation, *South. Surgeon* **8**: 416, 1939. Johnston, C. G.: Decompression in the Treatment of Intestinal Obstruction, *Surg., Gynec. & Obst.* **70**: 365, 1940. Penberthy, G. C.; Noer, R. J., and Benson, C. D.: Treatment of Adynamic Ileus by Gastrointestinal Intubation in Children, *ibid.* **71**: 211, 1940. Penberthy, G. C.; Irvin, J. L., and Tenery, R. M.: Fluid, Salt, and Nutritional Balance in Patients with Intestinal Suction Drainage, *Ann. Surg.* **112**: 530, 1940.
- Grant 494, 1938: Catharine Macfarlane, Woman's Medical College of Pennsylvania, \$480, value of periodic pelvic examination in detecting cancer of the uterus. See grant 536, 1939. Macfarlane, C.: An Experiment in Cancer Control, *Bull. Am. Soc. Control Cancer* **21**: 6, 1939. Macfarlane, C.; Fetterman, F. S., and Sturgis, M. C.: An Experiment in Cancer Control, *Am. J. Obst. & Gynec.* **39**: 983, 1940.
- Grant 495, 1938: Lincoln Oppen and Barnett Sure, University of Arkansas, \$600, relation of vascular disease to avitaminosis in the rat. Oppen, L.: Experimental Vascular Disease in Rats Produced by Multiple Depletions of Vitamin A, *Proc. Soc. Exper. Biol. & Med.* **40**: 449, 1939; Influence of Experimental Renal Damage on Toxicity of Hypervitaminosis D in Rats, *Arch. Path.*, to be published.
- Grant 501, 1938: Arthur H. Smith, Wayne University College of Medicine, \$200, serum proteins in relation to blood volume. Smith, A. H.: The Pattern of Serum Protein During Accelerated Growth, *Am. J. Physiol.*, to be published.
- Grant 505, 1938: Elizabeth S. Russell, Roscoe B. Jackson Memorial Laboratory, Bar Harbor, Me., \$250, genetics of tumors in the fruit fly. See grant 455, 1937.
- Grant 506, 1938: Harry Sobotka, Mount Sinai Hospital, New York, \$150, monomolecular layers of physically active substances (refund, \$41.77). Sobotka, H. H.: Monomolecular Saccharase Films, *J. Phys. Chem.*, to be published.
- Grant 507, 1938: Joseph H. Roe, George Washington University, \$500, vitamin C content of plant, animal and tumor tissue. See grant 562, 1939. Roe, J. H., and Hall, J. M.: The Vitamin C Content of Human Urine and Its Determination Through the 2,4-Dinitrophenylhydrazine Derivative of Dehydroascorbic Acid, *J. Biol. Chem.* **128**: 329, 1939. Kassan, R. J., and Roe, J. H.: The Preservation of Ascorbic Acid in Drawn Samples of Blood, *ibid.* **133**: 579, 1940.
- Grant 508, 1938: Louis N. Katz, Michael Reese Hospital, Chicago, \$250, factors influencing activities of the heart. See grant 573, 1940. Katz, L. N., and Lindner, E.: The Reaction of the Coronary Vessels to Drugs and Other Substances, *J. A. M. A.* **113**: 2116 (Dec. 9) 1939. Katz, L. N.: Observations on Cardiac Failure and the Mode of Its Production, Publication 13, American Association for the Advancement of Science, 1940, p. 184.
- Grant 511, 1938: Charles W. Turner, University of Missouri, \$500, relation of thyrotropic hormone of anterior pituitary to pregnancy and lactation. Turner, C. W.: Hormonic Interrelations Between Reproduction, Mammary Gland Growth and Lactation, *Growth* **3**: 323, 1939. Turner, C. W., and Cupps, P. T.: The Effect of Certain Experimental Conditions upon the Thyrotropic Hormone Content of the Albino Rat, *Endocrinology* **26**: 1042, 1940.
- Grant 513, 1938: John S. Lawrence, University of Rochester, \$350, transmissible granulocytopenia in the cat. Lawrence, J. S., and Syverson, J. T.: Spontaneous Agranulocytosis in the Cat, *Proc. Soc. Exper. Biol. & Med.* **38**: 914, 1938. Lawrence, J. S.; Pearce, H. E., and Mider, G. B.: Effect of Experimental Neutropenia on the Healing of Wounds, *Arch. Path.* **28**: 32 (July) 1939. Ackart, R. J.; Shaw, J. S., Jr., and Lawrence, J. S.: The Blood Cell Picture of Normal Cats, *Anat. Rec.* **76**: 357, 1940. Lawrence, J. S.; Syverson, J. T.; Shaw, J. S., Jr., and Smith, F. P.: Infectious Feline Agranulocytosis, *Am. J. Path.* **16**: 333, 1940.
- Grant 516, 1938: Charles O. Warren Jr., Cornell University Medical College, \$300, metabolism of bone marrow. See grant 558, 1939. Warren, C. O., Jr.: The Metabolism of Rabbit Bone Marrow in Serum, *Am. J. Physiol.* **126**: 650, 1939; The Metabolism of Rabbit Bone Marrow in Serum, *ibid.* **128**: 455, 1940; Respiration and Glycolysis of Rabbit Bone Marrow in Serum in Relation to Cellular Components, *ibid.* **131**: 176, 1940.
- Grant 517, 1938: Irving J. Wolman, Children's Hospital of Philadelphia, \$170, lipid pneumonia. See grant 477, 1937.
- Grant 519, 1938: D. B. Phemister and Harwell Wilson, University of Chicago, \$400, mechanism of blood pressure in sympathetomized dogs. See grant 550, 1939. Grimson, K. S.: The Role of the Sympathetic Nervous System and Its Renal and Splanchnic Distribution in Experimental Neurogenic Hypertension, *Proc. Soc. Exper. Biol. & Med.*, to be published; Total Thoracic and Partial to Total Lumbar Sympathectomy and Celiac Ganglionectomy in the Treatment of Essential Hypertension, *ibid.*, to be published.
- Grant 521, 1938: Rucker Cleveland, Vanderbilt University, \$400, cytology of endometrium. See grant 589, 1940. Cleveland, R.: Observations on the Chromatin in the Nuclei of Endometrium from Monkeys under Experimental Conditions, *Endocrinology* **27**: 580, 1940.
- Grant 526, 1938: Charles F. Code, University of Minnesota, \$400, metabolism of histamine. See grant 587, 1940. Code, C. F., and Jensen, J. L.: A Comparison of the Histamine Content of Blood and Bone Marrow, *Am. J. Physiol.* **129**: 336, 1940. Code, C. F., and Varco, R. L.: Chronic Histamine Action, *Proc. Soc. Exper. Biol. & Med.* **41**: 475,

1940. Walpole, S. H.; Varco, R. L.; Code, C. F., and Wangenstein, O. H.: Production of Gastric and Duodenal Ulcers in the Cat by Intramuscular Implantation of Histamine, *ibid.* 44: 619, 1940.

Grant 529, 1939: Helen F. Tucker, Skidmore College, \$175, effect of amino acids on liver lipids (refund, \$53.33). Tucker, H. F.; Treadwell, C. R., and Eckstein, H. C.: The Effect of Supplementary Cystine and Methionine on the Production of Fatty Livers by Rats on High Fat Diets Containing Casein or Edestin, *J. Biol. Chem.* 135: 85, 1940.

Grant 530, 1939: George Herrmann, University of Texas, \$200, chemical changes in heart muscle. Herrmann, G., and Decherd, G. M., Jr.: Some Studies in the Mechanism of Cardiac Hypertrophy, *Ann. Int. Med.* 13: 794, 1939.

Grant 534, 1939: Martin Silberberg, Washington University School of Medicine, \$600, effect of hormones on bone and cartilage. Silberberg, M., and Silberberg, R.: Effect of Potassium Iodide on Bone and Cartilage in Thyroidectomized Immature Guinea Pigs, *Arch. Path.* 28: 846 (Dec.) 1939; Effects of Ovariectomy and Long Continued Administration of Anterior Pituitary Extract of Cattle on Skeletal Tissues of Immature Guinea Pigs, *Ann. J. Path.* 16: 491, 1940; The Effect of Thyroidectomy and Administration of Anterior Pituitary Extract of Cattle on the Growth of Cartilage and Bone of Immature Guinea Pigs, *ibid.* 16: 491, 1940; Changes in Cartilage and Bone of Immature Female Guinea Pigs Due to Undernourishment, *Arch. Path.* 30: 675 (Sept.) 1940; The Response of Cartilage and Bone of the Newborn Guinea Pig to Stimulation by Various Hormones (Anterior Hypophyseal Extract, Estrogen, Thyroxine), *Anat. Rec.* 78: 549, 1940; Age Changes of Bones and Joints in Various Strains of Mice, *Ann. J. Anat.* 68: 69, 1941.

Grant 537, 1939: Herman Kabat, University of Minnesota, \$400, neurophysiologic alterations in anemia of the brain. See grant 586, 1940. Dennis, C., and Kabat, H.: Behavior of Dogs After Complete Temporary Arrest of the Cephalic Circulation, *Proc. Exper. Biol. & Med.* 40: 559, 1939. Kabat, H., and Dennis, C.: Resistance of Young Dogs to Acute Arrest of the Cephalic Circulation, *ibid.* 42: 534, 1939. Kabat, H.: Influence of Pregnancy and Lactation on Susceptibility to Arrest of Brain Circulation, *ibid.* 44: 23, 1940; The Greater Resistance of Very Young Animals to Arrest of the Brain Circulation, *Am. J. Physiol.* 130: 588, 1940.

Grant 540, 1939: James W. Henry, Loyola University School of Medicine, Chicago, \$200, experimental hypertension (refund, \$50). Henry, J. W.: Effect of Magnesium on the Pathogenesis of Hypertension Produced by Renal Ischemia in Albino Rats, to be published.

Grant 543, 1939: F. W. Dunihue, University of Vermont, \$50, action of aspartic acid on bone marrow (refund, \$1.84). Dunihue, F. W., and Candon, B. H.: Histologic Changes in the Renal Arterioles of Hypertensive Rabbits, *Arch. Path.* 29: 777 (June) 1940.

Grant 545, 1939: A. G. Eaton, Louisiana State University Medical Center, \$300, absorption of amino acids. Hall, W. K.; Doty, J. R., and Eaton, A. G.: The Availability of *dl*-Threonine and *dl*-Allo-threonine for the Formation of Carbohydrate, *Am. J. Physiol.* 131: 252, 1940.

Grant 546, 1939: Francis D. Gunn, Northwestern University Medical School, \$400, experimental tuberculosis in dogs. Mills, M. A.; Barth, E. E., and Gunn, F. D.: Experimental Pulmonary Tuberculosis in the Dog, *Am. Rev. Tuberc.* 42: 28, 1940. Colwell, C. A., and Mills, M. A.: Experimental Tuberculosis in the Dog: I. Cutaneous Sensitivity to Tuberculin in the Dog, *ibid.* 42: 259, 1940; Experimental Tuberculosis in the Dog. II. Comparison of Old Tuberculin and Purified Protein Derivative in Intracutaneous Tests, *ibid.* 42: 271, 1940.

Grant 550, 1939: D. B. Phemister and K. S. Grimson, University of Chicago, \$400, mechanism of blood pressure in sympathectomized dogs. See grant 519, 1938.

Grant 553, 1939: Paul L. Day and William C. Langston, University of Arkansas, \$200, nutritional cytopenia in the monkey. Day, P. L., and others: Nutritional Cytopenia in Monkeys Receiving the Goldberger Diet, *J. Exper. Med.* 72: 463, 1940.

Grant 554, 1939: Fritz Schiff, Beth Israel Hospital, New York, \$400, serologic classification of Salmonella. Schiff, F., and Saphra, I.: Variety of Types in Human Paratyphoid C Infections, *J. Infect. Dis.* 66: 97, 1940. Schiff, F., and Bornstein, S.: Hemolytic Effect of Typhoid Cultures in Combination with Pure Lines of Bacteriophage, *J. Immunol.* 39: 361, 1940.

Grant 555, 1939: Roy H. Turner, Tulane University, \$200, physiology of peripheral blood vessels. See grant 473, 1937.

Grant 556, 1939: Owen H. Wangenstein, University of Minnesota Medical School, \$900, physiologic basis of surgical treatment of duodenal and gastric ulcer. Wangenstein, O. H., and others: Gastric Acidity Before and After Operative Procedure with Special Reference to the Role of the Pylorus and Antrum, *Ann. Surg.* 112: 626, 1940.

Grant 558, 1939: Charles O. Warren Jr., Cornell University Medical College, \$262, metabolism of bone marrow. See grant 516, 1938.

Grant 561, 1939: Robert R. Sealock, University of Rochester, \$400, melanin pigmentation. Sealock, R. R., and Silberstein, H. E.: The Control of Experimental Alcaptonuria by Means of Vitamin C, *Science* 90: 2344, 1939. Sealock, R. R., and Silberstein, H. E.: The Excretion of Homogentisic Acid and Other Tyrosine Metabolites by the Vitamin C-Deficient Guinea Pig, *J. Biol. Chem.* 135: 251, 1940. Sealock, R. R.; Goldston, M., and Steele, J. M.: Administration of Ascorbic Acid to an Alcaptonuric Patient, *Proc. Soc. Exper. Biol. & Med.* 44: 580, 1940.

Grant 569, 1940: Israel Davidsohn, Mount Sinai Hospital, Chicago, \$400, bacteriogenic hemagglutination. Davidsohn, I., and Toharsky, B.: The Production of Bacteriogenic Hemagglutination, *J. Infect. Dis.* 67: 25, 1940.

2. INCOMPLETE

A. Work under the grant completed, account rendered of expenses but results not published:

Grant 254, 1932: J. Lisle Williams, Rush Medical College, Chicago, \$200, decreased dextrose tolerance in acute infectious diseases.

Grant 310, 1934: Lay Martin, Johns Hopkins University, \$150, gastric juice. See grant 462, 1937.

Grant 355, 1935: Royall M. Calder, San Antonio, Texas, \$150, mechanism of pneumococcal inflammation.

Grant 410, 1936: H. E. Eggers, University of Nebraska, \$200, effect of tetramethylarsonium gluconate on human cancer.

Grant 462, 1937: Lay Martin, Johns Hopkins University, \$200, gastric juice. See grant 310, 1934.

Grant 479, 1937: Tracy J. Putnam, Boston City Hospital, \$200, injuries to the cervical portion of the cord.

Grant 480, 1937: Amy L. Daniels, State University of Iowa, \$250, relation of fluorine to physiologic function.

Grant 504, 1938: Wallace M. Yater, Georgetown University Medical School, \$500, histopathology of "bundle branch" block.

Grant 518, 1938: Harold D. West, Meharry Medical College, \$100, synthesis of *dl*-threonine. See grant 559, 1939.

Grant 522, 1938: Ludwig A. Emge, Stanford University School of Medicine, \$500, relation of sex hormones to tumor growth.

Grant 542, 1939: Kendall B. Corbin, University of Tennessee, \$200, alterations in the hip after deafferentation.

Grant 559, 1939: Harold D. West, Meharry Medical College, \$50, synthesis of *dl*-threonine. See grant 518, 1938.

B. Active work still in progress:

Grant 413, 1936: Philip Levine, Newark Beth Israel Hospital, Newark, N. J., \$350, bacteriophage action in the dysentery group. Levine, P., and Perlstein, D.: Phage-Specific Heat-Labile Factors in *B. Dysenteriae* Sonne, *Proc. Soc. Exper. Biol. & Med.* 36: 295, 1937.

Grant 441, 1937: Edward S. West and G. E. Burget, University of Oregon Medical School, \$350, diuretic action and chemical metabolism of sorbitol. Todd, W. R.; Myers, J., and West, E. S.: On the Metabolism of Sorbitol and Mannitol, *J. Biol. Chem.* 127: 275, 1939.

Grant 445, 1937: Paul M. Levin, Johns Hopkins University, \$250, cerebral efferent tracts in primates. Levin, P. M.: A Nervous Structure in the Pineal Body of the Monkey, *J. Comp. Neurol.* 68: 405, 1938. Levin, P. M., and Bradford, F. K.: The Exact Origin of the Corticospinal Tract in the Monkey, *ibid.* 68: 411, 1938.

Grant 463, 1937: Jay Conger Davis, Minneapolis, \$600, action of certain drugs on the coronary arteries (refund, \$194.03). Davis, J. C.: Studies on Effect of Aminophyllin on Coronary Blood Flow, to be published.

Grant 474, 1937: Marion Fay, Woman's Medical College of Pennsylvania, \$275, biochemistry of strontium. See grant 552, 1939.

Grant 481, 1937: Warren O. Nelson, Wayne University College of Medicine, \$200, synthetic androgenic substances.

Grant 499, 1938: Robert W. Virtue, University of Denver, \$365, formation of bile acids. Virtue, R. W., and Doster-Virtue, M. E.: Studies on the Production of Taurocholic Acid in the Dog: IV. Cystine, Homocysteine and Thioglycolic Acid, *J. Biol. Chem.* 128: 665, 1939; The Failure of Intravenously Injected Fat to Produce Cholic Acid in the Dog, *ibid.* 133: 573, 1940.

Grant 503, 1938: R. C. Robb, Syracuse University College of Medicine, \$800, diseases in twins.

Grant 510, 1938: Erma A. Smith, Iowa State College, \$150, influence of various substances on gastrointestinal motility.

Grant 512, 1938: Barnes Woodhall, Duke University Hospital, \$350, reactions to implanted Shope rabbit papilloma by cerebral tissue. Woodhall, B.; Graves, R. W., and Beard, J. W.: Experimental Production of Tumors of the Brain with the Shope Rabbit Papilloma, *Arch. Surg.* 38: 457 (March) 1939. Woodhall, B., and Graves, R. W.: Production of Experimental Tumors of the Brain with the Shope Rabbit Papilloma: II, *ibid.* 39: 1041 (Dec.) 1939.

Grant 524, 1938: Ernest Spiegel, Temple University, \$300, physicochemical factors influencing the excitability of the central nervous system. Spiegel, E., and Wycis, H.: Influence of Hypochloremia upon the Convulsive Reactivity, *Proc. Soc. Exper. Biol. & Med.* 42: 400, 1939. Spiegel, E., and Spiegel-Adolf, M.: Mechanism of the Therapeutic Effect of Metrazol and Insulin Convulsions, *ibid.* 42: 834, 1939. Spiegel, E.: Comparative Study of the Anticonvulsant Effects of Various Bromides, *Arch. internat. de pharmacodyn. et de therap.* 63: 464, 1939.

Grant 527, 1938: Alexander Levy, University of Oregon Medical School, \$200, occlusion of the coronary arteries. See grant 577, 1940.

Grant 531, 1939: L. R. Dragstedt and G. M. Dack, University of Chicago, \$600, Bacterium necrophorum.

Grant 532, 1939: Walter Schiller, Cook County Hospital, Chicago, \$200, ovarian tumors.

Grant 533, 1939: Hardy A. Kemp and W. M. Fisher, Baylor University, \$500, venom of southern and southwestern scorpions.

Grant 536, 1939: Catharine Macfarlane, Woman's Medical College of Pennsylvania, \$1,900, value of periodic pelvic examination in detecting cancer of the uterus. See grant 494, 1938.

Grant 539, 1939: Albert V. Hardy, Columbia University, \$500, *Shigella dysenteriae*. Hardy, A. V.: The Mouse Mucin Test in the Study of *Shigella*.

Grant 541, 1939: Henry Laurens, Tulane University, \$350, lowering of arterial pressure by carbon arc radiation. See grant 498, 1938.

Grant 547, 1939: Max T. Schnitker, Toledo Hospital, Toledo, Ohio, \$300, Berger rhythm determinations following cerebral trauma.

Grant 548, 1939: Warren O. Nelson, Wayne University College of Medicine, \$300, relation of the thymus gland to growth and development. Segaloff, A., and Nelson, W. O.: The Thymus-Adrenal Relationship, *Am. J. Physiol.* 128: 475, 1940; Growth of Vitamin Deficient Rats Treated with Thymocrescin, *Endocrinology* 26: 860, 1940; Growth and Development of Six Generations of Albino Rats Under Treatment with Thymocrescin, *ibid.* 27: 693, 1940; Growth and Development of Six Generations of Thymectomized Albino Rats, *Am. J. Physiol.* 130: 671, 1940.

Grant 549, 1939: Felix Saunders, University of Chicago, \$250, growth requirements of pathogenic bacteria. Dorfman, A.; Koser, S. A., and Saunders, F.: Effect of Nicotinamide on Respiration of Dysentery Bacilli, *Science* 90: 2345, 1939. Koser, S. A.; Dorfman, A., and Saunders, F.: Pyridine Derivatives and Other Compounds as Growth-Promoting Sub-

stances for Dysentery Bacilli, *Proc. Soc. Exper. Biol. & Med.* **43**: 391, 1940. Dorfman, A., and others: Quantitative Response of the Dysentery Bacillus to Nicotinamide and Related Compounds **43**: 434, 1940. Bass, A., Berkman, S., and Saunders, F.: An Additional Growth Factor Needed by Some Hemolytic Streptococci, *J. Infect. Dis.*, to be published. Bass, A., and others: Growth Factors for Haemophilus Influenzae and H. Parainfluenzae, *ibid.*, to be published.

Grant 552, 1939: Marion Fay, Woman's Medical College of Pennsylvania, \$250, biochemistry of strontium. See grant 474, 1937.

Grant 557, 1939: W. D. Armstrong, University of Minnesota, \$500, calcification of bone in vitro.

Grant 560, 1939: B. S. Kline and H. P. Lankelma, Western Reserve University, \$500, chemical study of antigens.

Grant 562, 1939: Joseph H. Roe, George Washington University, \$350, vitamin C requirements of man.

Grant 563, 1939: Ben Vidgoff, University of Oregon Medical School, \$300, isolation and effect of the inhibitory hormone of the testes on the endocrine glands. Vidgoff, B., and Velhrs, H.: Studies on the Inhibitory Hormone of the Testes, *Endocrinology* **26**: 656, 1940.

Grant 564, 1939: Robert B. Greenblatt, University of Georgia, \$400, influence of gonadotropic preparations on the human ovary. Greenblatt, R. B., and Torpin, R.: The Evaluation of the Various Gonadotropins: Their Application to Female Endocrine Disorders, *J. M. A. Alabama* **9**: 409, 1940. Greenblatt, R. B., and Krafka, J.: Ruptured Follicle with Ovum in Situ, *Arch. Path.*, to be published.

Grant 565, 1939: Alexander S. Wiener, Office of the Chief Medical Examiner, New York City, \$200, agglutinogens in human blood and the Kline test. Wiener, A. S., and Peters, H. R.: Hemolytic Reactions Following Transfusions of Blood of the Homologous Group, with Three Cases in Which the Same Agglutinin Was Responsible, *Ann. Int. Med.* **13**: 2306, 1940.

3. NO PUBLISHABLE RESULTS OBTAINED

Grant 401, 1936: W. T. Dawson, University of Texas, \$200, toxicity of cardiac glucosides. The grantee died on Sept. 19, 1939.

Grant 431, 1936: Benjamin Harrow, College of the City of New York, \$200, purification of the hyperglycemic factor in urine.

Grant 451, 1937: Frank Co Tui, New York University, \$200, Schwartzman phenomenon and pyrogenic reaction. See grant 528, 1938.

Grant 456, 1937: Ira A. Manville, University of Oregon Medical School, \$500, relation of degenerative changes in connective tissue to glycuronic metabolism.

Grant 464, 1937: Frank W. Allen, University of California, \$200, relation of the nucleotide fraction of red corpuscles to glycolysis. See grant 373, 1935 (1936 report) and grant 418, 1936 (1938 report).

Grant 528, 1938: Frank Co Tui, New York University, \$150, relation between Schwartzman agent and pyrogen. See grant 451, 1937.

Grant 535, 1939: W. R. Tweedy, Loyola University School of Medicine, Chicago, \$200, phosphorus metabolism (refund, \$102.38). Work was discontinued because radioactive material could not be obtained.

Grant 551, 1939: Hugh S. Morgan, Vanderbilt University School of Medicine, \$300, bacterial infections in the chick embryo.

Report of Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research.

During the year 1940 the committee issued thirty-three new grants. A detailed list of these grants, together with a list of publications during 1940 and of unexpired grants made before Jan. 1, 1940, will be found in the appended report.

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research, reports of which were published during 1940:

The Excitant Action of Morphine on the Cat, W. E. Hamburger: *J. Pharmacol. & Exper. Therap.* **69**: 289 (Aug.) 1940.

The Effect of Sulfanilamide on Blood Sugar and Liver Glycogen, Esther M. Greisheimer, Roberta Hafkesbring and Hulda Magalhaes: *Am. J. Physiol.* **129**: 371 (May) 1940.

The Emptying Time of the Human Stomach After the Administration of Progestin, Clark K. Sleeth and Edward J. Van Lier: *Endocrinology* **26**: 535 (March) 1940.

The Emptying Time of the Normal Human Stomach as Influenced by Sulfapyridine, David W. Northrup and Edward J. Van Lier: *J. Pharmacol. & Exper. Therap.* **70**: 297 (Nov.) 1940.

The Emptying Time of the Normal Human Stomach as Influenced by Acid and Alkali, with a Review of the Literature, Edward J. Van Lier and Clark K. Sleeth: *Am. J. Digest. Dis.* **7**: 118 (March) 1940.

Relation Between Structure of Epinephrine and Ephedrine Homologs and Analogs and Ability to Inhibit Sympathetic Ganglia, Amedeo S. Marrazzi: *J. Pharmacol. & Exper. Therap.* **69**: 294 (Aug.) 1940.

Cobalt Color Reaction of Barbiturates, Richard F. Riley, R. F. Krause, Luville T. Steadman, F. E. Hunter and Harold C. Hodge: *Proc. Soc. Exper. Biol. & Med.* **45**: 424 (Oct.) 1940.

Concentration of Paraldehyde in the Blood Following Its Administration During Labor, Herman L. Gardner, Harry Levine and Meyer Bodansky: *Am. J. Obst. & Gynec.* **40**: 435 (Sept.) 1940.

The Pulmonary and Urinary Excretion of Paraldehyde in Normal Dogs and in Dogs with Liver Damage, Harry Levine, A. J. Gilbert and Meyer Bodansky: *J. Pharmacol. & Exper. Therap.* **69**: 316 (Aug.) 1940.

Determination of Paraldehyde in Biological Fluids, Harry Levine and Meyer Bodansky: *J. Biol. Chem.* **133**: 193 (March) 1940.

Cardiovascular Effects of Potassium, Calcium, Magnesium and Barium, A. W. Winkler, H. E. Hoff and P. K. Smith: *Yale J. Biol. & Med.* **13**: 123 (Oct.) 1940.

The Effect of Magnesium on Neuromuscular and Reflex Activity in Relation to Its Concentration in the Serum, H. E. Hoff, A. W. Winkler and P. K. Smith: *Am. J. Physiol.* **129**: P384 (May) 1940.

Effects of Magnesium on the Nervous System in Relation to Its Concentration in Serum, H. E. Hoff, P. K. Smith and A. W. Winkler: *Am. J. Physiol.* **130**: 292 (Aug.) 1940.

Cardiovascular Changes Following the Intravenous Administration of Barium Chloride, P. K. Smith, A. W. Winkler and H. E. Hoff: *J. Pharmacol. & Exper. Therap.* **68**: 113 (Jan.) 1940.

A Micro-Method for Digitalis Assay, George H. Paff: *J. Pharmacol. & Exper. Therap.* **69**: 311 (Aug.) 1940.

Reversibility of Digitalis Action, George H. Paff and Ben B. Johnson: *Proc. Soc. Exper. Biol. & Med.* **44**: 155 (May) 1940.

Influence of Sex Life upon Resistance to Nostal and Pentobarbital, Harold G. O. Holck and Lewis D. Fink: *J. Am. Pharm. A. (Scient. Ed.)* **29**: 475 (Nov.) 1940.

Reactions of Large and Small Arteries in Man to Vasoconstrictor Stimuli, Alrick B. Hertzman and John B. Dillon: *Am. J. Physiol.* **130**: 56 (July) 1940.

Distinction Between Arterial, Venous and Flow Components in Photoelectric Plethysmography in Man, Alrick B. Hertzman and John B. Dillon: *Am. J. Physiol.* **130**: 177 (July) 1940.

Photoelectric Oscillometry of Large, Small and Smallest Arteries in Man, Alrick B. Hertzman: *Am. J. Physiol.* **129**: 381 (May) 1940.

Studies on the Photoelectrically Recorded Volume Pulses of the Finger Pad of Normal and Pathological Subjects, Alrick B. Hertzman: *Am. J. Physiol.* **129**: 345 (May) 1940.

Effects of Cigaret Smoking on the Skin Circulation, Alrick B. Hertzman: *Am. J. Physiol.* **129**: 357 (May) 1940.

The Plasma Coagulation Time as a Simple Test for Vitamin K Deficiency, Garnett Cheney: *Am. J. M. Sc.* **200**: 327 (Sept.) 1940.

Availability of Staphylococcal Antitoxin After Intramuscular Injection into Normal Monkeys and Men, Charles Weiss: *Proc. Soc. Exper. Biol. & Med.* **43**: 441 (March) 1940.

Effect of Concomitant Administration of Estrogens and Progesterone on Vaginal Smear in Man, Ephraim Shorr: *Proc. Soc. Exper. Biol. & Med.* **43**: 501 (March) 1940.

Effect of Pitressin, the Nitrites, Epinephrine and the Xanthines on Coronary Flow in Mammalian Hearts, Harold D. Green: *Am. A. Advancement Sc.* **13**: 105.

Studies in the Detoxification of Procaine, R. Beutner: *Anesth. & Analg.* **19**: 132 (May-June) 1940.

Evidence for the Local Effect of Mercurial Diuretics, R. Beutner, J. Landay and A. Lieberman Jr.: *Proc. Soc. Exper. Biol. & Med.* **44**: 120 (May) 1940.

Chemotaxis of Monocytes Contrasted with that of Polymorphonuclear Leukocytes and Lymphocytes, Dale Rex Coman: *Arch. Path.* **30**: 896 (Oct.) 1940.

Additional Observations on Positive and Negative Chemotaxis, Dale Rex Coman: *Arch. Path.* **29**: 220 (Feb.) 1940.

Study of Estrin Metabolism, Mary E. Collett: *Proc. Am. Physiol. Soc.* **129**: 336, 1940.

Renal Phosphatase in Experimental Nephropathies, Opal E. Hepler, J. P. Simonds and Helen Gurley: *Proc. Soc. Exper. Biol. & Med.* **44**: 221, 1940.

Metabolism of Free Citric Acid in the Rat, Carl A. Kuether, Curtis E. Meyer and Arthur H. Smith: *Proc. Soc. Exper. Biol. & Med.* **44**: 224, 1940.

The Ultraviolet Absorption Spectrum of Prolactin, Abraham White and G. I. Lavin: *J. Biol. Chem.* **132**: 717 (Feb.) 1940.

Fractionation of Saline Extracts of Anterior Pituitary Tissue, Roy W. Bonsnes and Abraham White: *Endocrinology* **26**: 990 (June) 1940.

Research on Pyrimidines: The Synthesis from Uracil of Pyrimidines Related Structurally to Thiamine, Doris Riell and T. B. Johnson: *Rec. d. trav. Chim. d. Pays-Bas*, edited by the Nederlandsche Chemische Vereeniging, **59**: 87 (Jan.) 1940.

Alkyl Nitrites: VI. A Contribution to the Mechanism of the Action of Organic Nitrites, John C. Krantz Jr.: *J. Pharmacol. & Exper. Therap.* **70**: 323, 1940.

Studies in the Metabolism of Dextrose Fragments in Man, F. E. Beck, R. Musser, C. J. Carr and John C. Krantz Jr.: *Ann. Int. Med.* **14**: 122 (July) 1940.

Urine Excretion During Anoxia from Normal and Denervated Kidneys in Dogs With and Without Adrenal Glands, Louis A. Toth: *Am. J. Physiol.* **129**: 532 (June) 1940.

The Correlation of Antral and Bulbar Pressures with Fluoroscopic Observations During Gastric Evacuation, J. P. Quigley, J. M. Werle and Daniel Brody: *Am. J. Digest. Dis.* **7**: 434 (Oct.) 1940.

Effect of Gastric Filling on Antral and Bulbar Pressure Patterns, Jacob M. Werle, Daniel Brody and J. P. Quigley: *Am. J. Physiol.* **129**: 493 (May) 1940.

Gastric Evacuation: Correlation of Antral and Bulbar Pressure with Fluoroscopic Observations, J. P. Quigley, J. M. Werle and Daniel Brody: *Am. J. Physiol.* **129**: 444 (May) 1940.

Intralumen Pressures of the Digestive Tract, Especially the Pyloric Region, D. A. Brody, J. M. Werle, I. Meschan and J. P. Quigley: *Am. J. Physiol.* **130**: 791 (Oct.) 1940.

The Transmission of Lymphogranuloma Venereum to the Guinea Pig, Arthur W. Grace and Florence H. Suskind: *Am. J. Path.* **16**: 169 (March) 1940.

The Effect of Sulfanilamide on Several Parasitic Infections of Laboratory Rats and Mice, J. T. Culbertson: *J. Parasitol.* **26**: 235 (June) 1940.

The Retardation of Growth by Deuterium Oxide (*Obelia Geniculata*), F. S. Hammett and H. G. Barbour: *Growth* 3: 403 (Oct.) 1939.

The Effects of Repeated Anesthetic Doses of Sodium Amytal and Sodium Barbital, Roberta Hafkesbring, Esther Greisheimer and Hulda Magalhaes: *Vet. Med.* 35: 196 (March) 1940.

Nutritional Muscle Dystrophy and Sex Hormones, Sergius Morgulis and Charles E. Richards: *Endocrinology* 27: 522 (Sept.) 1940.

Effects of Sympathomimetic Amines on Perfused Blood Vessels, M. C. Morton and M. L. Tainter: *J. Physiol.* 98: 263, 1940.

The Influence of the Growth Promoting Hormone of the Anterior Lobe of the Pituitary upon Growth Activity in the Long Bone of the Rat, Evelyn Smith Ross and Franklin C. McLean: *Endocrinology* 27: 329 (Aug.) 1940.

The Native Hormones of the Posterior Pituitary Gland: The Pressor and Oxytocic Principles, Morris Rosenfeld: *Bull. Johns Hopkins Hosp.* 66: 398 (June) 1940.

The Pattern of the Arterial Pressure Pulse Under Different Conditions, W. F. Hamilton: *Am. J. Physiol.* 129: 373 (May) 1940.

Some Pharmacologic Effects of N-Propyl Theobromine, E. Vogt and R. A. Woodbury: *Am. J. Physiol.* 129: 486 (May) 1940.

Blood Pressure Studies of the Effects of Pituitary Preparations on the Human, R. A. Woodbury, W. F. Hamilton and P. P. Volpitto: *Am. J. Physiol.* 129: 500 (May) 1940.

Blood Pressures in Aortic Coarctation, R. A. Woodbury, E. E. Murphey and W. F. Hamilton: *Arch. Int. Med.* 65: 752 (April) 1940.

Blood Volume and Extracellular Fluid Volume of Infants and Children, M. Robinow and W. F. Hamilton: *Am. J. Dis. Child.* 60: 827 (Oct.) 1940.

Comparison of the Action of Choline and Lipocain in the Prevention of Cholesterol Atherosclerosis in the Rabbit, K. R. Andrews and G. O. Brown: *J. Clin. Investigation* 19: 786, 1940.

The Effect of Sodium Chloride on the Glucose Tolerance of the Diabetic Rat, J. M. Orten and H. B. Devlin: *J. Biol. Chem.* 136: 461 (Nov.) 1940.

During 1940 the following grants were made:

Grant 403: Erwin E. Nelson, professor of pharmacology, Tulane University School of Medicine, \$100, to investigate pituitary extracts.

Grant 404: Carl Pfeiffer, Department of Pharmacology, Wayne University College of Medicine, \$300, to investigate caffeine withdrawal headaches.

Grant 405: A. C. Ivy, Department of Physiology, Northwestern University Medical School, \$225, to investigate the effect of gastrectomy on the monkey.

Grant 406: John C. Krantz Jr., professor of pharmacology, University of Maryland, \$250, to investigate the action of the nitrites.

Grant 407: W. F. Hamilton, professor of pharmacology and Physiology, University of Georgia School of Medicine, \$125, to investigate blood pressure and blood pressure reflexes.

Grant 408: Ephraim Shorr, assistant professor of medicine, Cornell University Medical College, \$300, to investigate the effect of progesterone on the vaginal smear.

Grant 409: R. Beutner, professor of pharmacology, Hahnemann Medical College and Hospital, Philadelphia, \$200, to investigate the toxicity and detoxification of local anesthetics.

Grant 410: Linn J. Boyd, professor of pharmacology, New York Medical College, \$100, to investigate the effects of emetine on the heart.

Grant 411: Linn J. Boyd, professor of pharmacology, New York Medical College, \$300, to investigate the effects of hypnotics on mercurial diuresis.

Grant 412: Anne Forbes, Massachusetts General Hospital, Boston, \$400, to investigate the effect of various endocrine diseases and the administration of various endocrine products on the 17-keto-steroid secretion in the urine.

Grant 413: Claude E. Forkner, New York Hospital, Department of Medicine, \$300, to investigate bronchiectasis, etiology and treatment.

Grant 414: Esther M. Greisheimer, professor of physiology, Woman's Medical College of Pennsylvania, \$250, to investigate the effects of sulfanilamide and related compounds on blood sugar and liver glycogen.

Grant 415: B. K. Harned, professor of pharmacology, and V. V. Cole, assistant professor of pharmacology, Woman's Medical College of Pennsylvania, \$300, to investigate the effects of sulfanilamide and sulfapyridine on hepatic function.

Grant 416: Alrick B. Hertzman, associate professor of physiology, St. Louis University School of Medicine, \$500, to investigate peripheral circulation.

Grant 417: H. E. Hoff, assistant professor of physiology; A. W. Winkler, instructor in medicine, and P. K. Smith, research assistant in pharmacology and toxicology, Yale University School of Medicine, \$250, to investigate the action of ions.

Grant 418: Morton McCutcheon, associate professor of pathology, University of Pennsylvania School of Medicine, \$150, to investigate the effect of the sulfanilamide group on chemotaxis of the leukocyte.

Grant 419: Thomas H. McGarack, New York Medical College, \$300, to investigate the action of lipocain and pancreatic extracts.

Grant 420: Lester M. Morrison, Temple University Medical School and Hospital, \$300, to investigate the effect of sulfanilamide on infections of the gallbladder.

Grant 421: Herbert Silvette, assistant professor of pharmacology, University of Virginia Medical School, \$250, to investigate the effects of the antidiuretic hormone of the posterior pituitary gland.

Grant 422: Charles W. Turner, professor of dairy husbandry, University of Missouri College of Agriculture, \$500, to investigate the action of lactogenic hormone in cases of deficient lactation.

Grant 423: Treat B. Johnson, professor of organic chemistry, Yale University School of Medicine, \$250, to investigate pyrimidines.

Grant 424: Charles W. Green, Department of Physiology, Stanford University School of Medicine, \$150, to investigate coronary drugs.

Grant 425: Amedeo S. Marrazzi, Department of Pharmacology and Therapeutics, New York University College of Medicine, \$500, to investigate the action of sympathomimetic amines.

Grant 426: J. P. Quigley, Department of Physiology, Western Reserve University School of Medicine, \$250, to investigate the mechanism of pylorospasm.

Grant 427: Arthur M. Master, the Mount Sinai Hospital, New York, \$500, to investigate the influence of nutrition and drugs on the cardiac output in coronary occlusion.

Grant 428: Milton Kissin, Beth Israel Hospital, New York, \$50, to investigate the influence of aminophyllin among cardiac patients.

Grant 429: John A. Vaichulis, Loyola University School of Medicine, \$300, to investigate the separation of the pressor and oxytocic fractions from the pituitary gland.

Grant 430: J. P. Simonds, Department of Pathology, Northwestern University Medical School, \$100, to investigate the selective action of different types of poisons on the kidneys.

Grant 431: Meyer Bodansky, professor of pathological chemistry, University of Texas School of Medicine, \$200, to investigate the metabolism and pharmacology of paraldehyde.

Grant 432: Abraham White, assistant professor of physiological chemistry, Yale University School of Medicine, \$200, to investigate the anterior pituitary gland.

Grant 433: Harry Beckman, professor of pharmacology, Marquette University School of Medicine, \$250, to investigate the prophylaxis of malaria.

Grant 434: William R. Lyons, Division of Anatomy, University of California Medical School, \$200, to investigate lactogenic hormones.

Grant 435: H. N. Cole, clinical professor of dermatology and syphilology, Western Reserve University School of Medicine, \$330, to investigate the effect of the administration of gold sodium thiosulfate.

The following grants were issued before Jan. 1, 1940. In some cases the grant has expired and an unexpended balance remains; or the work is not yet completed or not yet published.

Grant 164: E. L. Jackson, associate professor of pharmacology, Emory University School of Medicine, \$200, to investigate the antagonism between sodium barbital and insulin.

Grant 221: John G. Reinhold, Department of Public Health, Philadelphia General Hospital, \$250, to investigate the action of aminoacetic acid (glycine) in progressive muscular dystrophy.

Grant 223: Clinton H. Thienes, professor of pharmacology, and Lawrence E. Detrick, Department of Pharmacology, University of Southern California School of Medicine, \$200, to investigate withdrawal phenomena in morphine addicted animals.

Grant 232: George R. Cowgill, associate professor of physiologic chemistry, Yale University School of Medicine, \$250, to investigate the heart in vitamin B deficiency.

Grant 236: C. W. Greene, professor of physiology and pharmacology, University of Missouri School of Medicine, \$100, to investigate the pharmacology of the so-called specific coronary dilator drugs.

Grant 238: Roy R. Kracke, professor of pathology, Emory University School of Medicine, \$250, to investigate the effect of the oxidation products of aminopyrine and related drugs on the leukocyte counts of rabbits.

Grant 248: Fred C. Koch, chairman of the Department of Physiological Chemistry and Pharmacology, University of Chicago, \$250, to investigate the male sex hormone.

Grant 251: Robert Spaeth, formerly of the University of Illinois College of Medicine, \$100, to investigate the titration of the antitoxic value of serum of patients who have received tetanus antitoxin.

Grant 261: Robert P. Walton, professor of pharmacology, University of Mississippi School of Medicine, \$100, to investigate the absorption of drugs through the oral mucosa.

Grant 263: H. A. Shoemaker, associate professor of biochemistry and pharmacology; C. E. Clymer, professor clinical surgery, and Henry H. Turner, University of Oklahoma School of Medicine, \$150, to investigate the blood cholesterol and iodine value in thyroid disease and their alteration by treatment.

Grant 264: Detlev W. Bronk, Johnson professor of biophysics, University of Pennsylvania School of Medicine, \$200, to investigate the action of various drugs on the autonomic centers.

Grant 278: William H. Lewis Jr., assistant clinical professor of medicine, and Arthur C. DeGraff, professor of therapeutics, New York University College of Medicine, \$150, to investigate the function of the heart in relation to age.

Grant 280: John P. Peters, professor of medicine, Yale University School of Medicine, \$200, to investigate by means of intravenous pyelography the state of the ureters and kidneys in a large series of patients after delivery and subsidence of acute signs of toxemia.

Grant 297: Melvin Dresbach, Harvard University School of Medicine, \$250, to investigate the emetic effect of some of the digitalis bodies.

Grant 302: Mary E. Collett, Flora Stone Mather College, Western Reserve University, \$200, to investigate the effect of the female sex hormone on the hot flashes and the basal metabolism of ovariectomized women.

Grant 305: Beverly Douglas, assistant dean and associate professor of surgery, Vanderbilt University School of Medicine, \$250, to investigate the pneumatic (transparent rubber jacket) system in treating extensive wounds.

Grant 306: Edwards A. Park, professor of pediatrics, Johns Hopkins University School of Medicine, \$75, to investigate rickets in the rat and the effect of solution of parathyroid on the circulation of the bone.

Grant 308: Claus W. Jungblut, professor of bacteriology, Columbia University College of Physicians and Surgeons, \$250, to investigate the relation of vitamin C to diphtheria.

Grant 311: Clarence P. Berg, assistant professor of biochemistry, State University of Iowa, \$250, to investigate amino acids.

Grant 314: F. C. Koch, chairman of the Department of Physiological Chemistry and Pharmacology, University of Chicago, \$250, to investigate provitamin D.

Grant 316: Edward Van Liere, professor of physiology, West Virginia University School of Medicine, \$100, to investigate the action of various drugs on gastric motility.

Grant 333: Owen S. Gibbs, chief of Pharmacological Division, University of Tennessee College of Medicine, \$180, to investigate the toxicity of morphine and scopolamine on rats.

Grant 355: Peter K. Knoefel, associate professor of pharmacology, University of Louisville School of Medicine, \$150, to investigate the action of amines, of the epinephrine series and of related substances on the central nervous system.

Grant 356: John B. Lagen, research associate in medicine, University of California Medical School, \$150, to investigate the potassium and sodium ions in the blood of asthmatic patients and in anxiety states.

Grant 358: R. J. Main, associate professor of physiology and pharmacology, Medical College of Virginia, \$100, to investigate the effects of epinephrine and amphetamine on alveolar carbon dioxide in man.

Grant 360: F. C. McLean, professor of pathology and physiology, the University of Chicago, \$125, to investigate the mode of action of dihydrotachysterol (A. T. 10).

Grant 362: James M. Orten, assistant professor of physiologic chemistry, Wayne University College of Medicine, \$150, to investigate the effect of copper and certain other inorganic salts on the hypoglycemic activity of insulin.

Grant 367: Simon Benson, dean of pharmacy, Ferris Institute, \$100, to investigate the therapeutic effects of skin counterirritants.

Grant 370: Harald G. O. Holck, associate professor of pharmacology, University of Nebraska College of Pharmacy, \$250, to investigate the possible effect of aging on the strength of digitalis preparations.

Grant 371: H. N. Cole, clinical professor of dermatology and syphilology, Western Reserve University School of Medicine, \$75, to investigate arsenamine dermatitis.

Grant 374: W. E. Hambourger, assistant professor of pharmacology, Western Reserve University School of Medicine, \$150, to investigate the pharmacology of the central nervous system.

Grant 375: Joseph Seifter, Department of Pharmacology, Western Reserve University School of Medicine, \$250, to investigate the pharmacology of metal alkyls.

Grant 376: R. W. Gerard, professor of physiology, the University of Chicago, \$200, to investigate the therapeutic effect of pyocyanin in schizophrenia.

Grant 377: Harold D. Green, assistant professor of physiology, Western Reserve University School of Medicine, \$250, to investigate the effects of the intravenous injection of various drugs on the coronary flow.

Grant 378: Carl Pfeiffer, Department of Pharmacology, Wayne University, Detroit, \$200, to investigate the diuretic effect of organic mercurials.

Grant 379: H. S. Rubinstein, Sinai Hospital, Baltimore, \$200, to investigate the effect of various hormones on spermatogenesis.

Grant 380: M. L. Tainter, professor of pharmacology, Stanford University School of Medicine, \$250, to investigate sympathomimetic amines.

Grant 384: William Bradford, associate professor of pediatrics, University of Rochester School of Medicine, \$300, to investigate pertussis.

Grant 387: Harold C. Hodge, assistant professor of biochemistry and pharmacology, the University of Rochester School of Medicine and Dentistry, \$250, to investigate the action of barbiturates by the use of the photoelectric colorimeter.

Grant 389: David Marine, Montefiore Hospital for Chronic Diseases, New York, \$200, to investigate iodine-bromine relations in the body.

Grant 390: C. H. McDonald, professor of physiology and pharmacology; R. W. Boyle, assistant professor of physiology and pharmacology, and Kenneth Siler, assistant professor of physiology and pharmacology, University of Arkansas School of Medicine, \$250, to investigate some aspects of cardiac metabolism.

Grant 391: A. R. McIntyre, professor of physiology and pharmacology, the University of Nebraska College of Medicine, \$100, to investigate ouabain and cardiac muscle and metabolism.

Grant 392: Arthur H. Smith, chairman of the Department of Physiological Chemistry, Wayne University College of Medicine, \$200, to investigate the rate of absorption of citric acid and citrates from the intestine, and the relative significance of these compounds as precursors of liver glycogen.

Grant 393: Arnold De M. Welch, formerly of the Department of Pharmacology, Washington University School of Medicine, \$300, to investigate the lipotropic activity of choline, betaine and their derivatives.

Grant 394: Harold W. Werner, assistant professor of physiology and pharmacology, the University of North Dakota Medical School, \$150, to investigate the effects of analeptics in alcohol depression.

Grant 395: R. W. Whitehead, professor of physiology and pharmacology, University of Colorado School of Medicine and Hospitals, \$150, to investigate the influence of electrolytes in anaphylaxis.

Grant 397: G. O. Broun, professor of internal medicine, St. Louis University School of Medicine, \$250, to investigate the prevention and treatment of atherosclerosis.

Grant 399: R. H. Rigdon, associate professor of pathology, the University of Tennessee, Pathological Institute, \$150, to investigate the effect of sulfapyridine on staphylococcus toxin in mice.

Grant 400: Harald Holck, associate professor of pharmacology, the University of Nebraska College of Medicine, \$150, to investigate the relation of sex to drug action.

Grant 402: Harry Beckman, professor of pharmacology, Marquette University School of Medicine, \$250, to investigate the prophylaxis of malaria.

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association for the Year Ended December 31, 1940

Investments (At Cost) as at January 1, 1940.....	\$2,349,263.47
Bonds Purchased (At Cost).....	245,593.75
	<u>\$2,594,857.22</u>
Less:	
Bonds Matured, Sold or Called.....	276,959.38
	<u>Investments as at December 31, 1940.....</u>
	\$2,317,897.84
Balance for Investment January 1, 1940.....	\$ 128,015.89
Interest Received on Investments—Year 1940..	81,278.16
	<u>Uninvested Funds December 31, 1940.....</u>
	209,294.05

AUDITOR'S REPORT

January 25, 1941.

To the Board of Trustees,

American Medical Association, Chicago, Illinois.

Dear Sirs:

We have examined the Balance Sheet of the American Medical Association, Chicago, Illinois, as at December 31, 1940, and the statement of Income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and, without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated.

The cash and bank balances have been confirmed by count or by certificates from the depositaries. The U. S. Government and other marketable securities were inspected; also, an acknowledgment as to custody of the securities for safekeeping was received from the Continental Illinois National Bank and Trust Company of Chicago.

We did not independently confirm the accounts receivable by communication with the debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable. We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded.

Expenditures charged to property and equipment accounts during the year, in our opinion, were properly capitalized as representing additions or improvements. The provision for depreciation for the year appears to be adequate.

In our opinion, subject to the exceptions set forth in paragraph three, the accompanying Balance Sheet and related statement of Income present fairly the position of the American Medical Association at December 31, 1940, and the results of the operations for the year, based on the accounting procedures employed by the Association regarding which the following observations are submitted:

(a) In accordance with the established practice of the Association, the accounts as stated do not include (a) unrecorded assets in respect of accrued interest on bond investments, and membership dues unpaid; and (b) provision for accrued property taxes for the year 1940, and sundry unpaid bills and wages.

(b) Subscriptions paid in advance are stated at an estimated amount which is based on cash received in December 1940, on account of 1941 subscriptions. This procedure conforms to the method used in prior years.

(c) Advance payments on publications include an estimated amount (\$126,344.51) for prepaid subscriptions to *HYGIEA*, and the amount (\$20,086.29) received in advance for January 1941, advertising, directory information sales and service.

(d) The buildings of the Association are carried at reproduction values as determined by an appraisal by Holabird and Root as at December 31, 1936, less depreciation accrued to the date of the Balance Sheet. The portion of the depreciation provision for the year applicable to the increase in book value which was recorded at December 31, 1936, as determined by the appraisal, has been charged against the complementary credit included in the Net Worth of the Association in that connection.

We have received a letter from Messrs. Loesch, Scofield, Loesch and Burke, attorneys for the Association, regarding litigation pending against the Association or its officers at December 31, 1940, which states that the following lawsuits had been filed:

Dr. Jean Paul Fernel—\$1,000,000.00 (libel)
Wm. E. Balsinger—\$100,000.00 (libel)
Muriel Longini—\$1,000.00 (claim)
J. Thompson Stevens—\$350,000.00 (libel)
United States of America (conspiracy in restraint of trade)

The attorneys state that in their opinion all of these suits will be defeated.

Fidelity insurance is carried against the undermentioned officers and employees, in the amount stated:

Dr. Olin West, Secretary and General Manager.....\$10,000.00
Dr. Herman L. Kretschmer, Treasurer..... 10,000.00
E. A. Hoffman, Cashier..... 10,000.00
J. E. Hartigan, Assistant Cashier..... 2,000.00
Sundry Employees (thirteen, \$1,000.00 each)..... 13,000.00
Total Fidelity Insurance.....\$45,000.00

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for the proper conduct of the examination.

Yours truly,
PEAT, MARWICK, MITCHELL & Co.

REPORT OF THE JUDICIAL COUNCIL

To the Members of the House of Delegates of the American Medical Association:

The year just completed has been one of comparative quiet and steadiness as far as the Judicial Council has been concerned. There have been few inquiries and complaints and no disciplinary appeals to be reviewed. There have been the usual number of inquiries concerning ethical principles, but there has been evident an inclination to cite particular instances or situations on which judgment, rather than an explanation underlying a principle, is desired. It is seldom that the Council can answer inquiries on specific instances, as all the relating and surrounding circumstances cannot be known to it and these factors must be taken into consideration.

PRINCIPLES, NOT LAWS

In spite of all that has been said during past years in the annual reports of the Council, the impression still prevails among a large section of our membership that the Principles

of Medical Ethics is a code of laws governing the actions of physicians. As long as such impressions obtain, it cannot be said too often that these principles are not laws to govern but are principles to guide to correct conduct. It is evident in the correspondence that in many instances the inquirer, frequently a component society, desires an opinion from the Council in order to prejudge a situation on which action by the society is under consideration. It should be obvious, but apparently is not, that the Judicial Council cannot pass judgment in advance on a situation which later may come under its review on appeal. The Council cannot be an attorney for the societies and later a judge over their actions.

Furthermore, the membership of the Council, even though spread over the United States from New York to Washington and from Ohio to Texas, cannot be familiar with local laws, customs and needs, all of which must be taken into consideration in an interpretation of the Principles as applied to a specific situation. The Principles of Medical Ethics of the American Medical Association in all its statements is based on and covered by the first section; namely, "A profession has for its prime object the service it can render to humanity; reward or financial gain should be a subordinate consideration. The practice of medicine is a profession. In choosing this profession an individual assumes an obligation to conduct himself in accord with its ideals." That statement is the foundation on which all subsequent statements are based and on which they must be interpreted. The principle is the same in all sections of the country, but what may be ethical in one place may be unethical in another as the result of different laws, different customs, different needs of the people. The Judicial Council cannot have knowledge of all these. Each constituent state medical association should have the knowledge in its own state which the Judicial Council lacks, and many of the inquiries coming to the Council should have been addressed to the state associations, the officers of which, because of proximity, are better qualified to advise.

CLASSIFICATIONS OF MEMBERSHIP

In its report for 1940 the Judicial Council advocated examination of the constitutions and by-laws of component and constituent societies and of the Constitution and By-Laws of the American Medical Association particularly in relation to membership and uniformity of classification. The report recommended that the Judicial Council "be directed by the House of Delegates to investigate further the conditions present in the matter of membership . . . and Fellowship . . . and to report, with recommendations, to the House of Delegates at the 1941 annual session." The report also recommended that the Council be directed to continue its study of the Constitution and By-Laws of the Association and to report to the House of Delegates at the annual session in 1941. The report also stated, in reference to resolutions introduced the previous year proposing a rearrangement and rewording of the Principles of Medical Ethics: "There is at present so much turmoil in medical organization and its relation to government that it seems wise to let the muddled waters settle before any consideration is given to so fundamental a feature of our organization as our Principles of Medical Ethics."

At the time of preparation of this report, the case of the *United States of America v. the American Medical Association and others* is on trial in Criminal Division No. 2 of the District Court of the United States in the District of Columbia. The prosecution is still being heard. It is the opinion of the Judicial Council that, at least until the verdict in this court has been rendered, only urgent changes in the Constitution, By-Laws and Principles of Medical Ethics should be made. Organization law and ethical principles have not as yet come under review in this trial, and it is the judgment of the Council that the status quo be maintained until they have.

INSIGNIA FOR MEMBERS OF SPECIAL GROUPS

During the past year an organization having to do with the certification of physicians requested the opinion of the Judicial Council on the ethical standing of their credential holders should they carry or wear a key indicating their membership in that organization or show on their professional stationery a replica of the key together with initial letters indicating

their membership. It was felt that approval of such procedure if given to one group of doctors of medicine could not well be withheld from any other body composed of doctors of medicine desiring to do likewise; that, if such a custom became prevalent, irregular practitioners and cultists would rapidly follow suit; that the display advertising of those least qualified to give good medical care to the public would be most apparent, and that the confusion in the lay mind would lead to much harm to the indiscriminating public. The members of the Council were of the opinion that such procedure would fall within the provisions of chapter III, article I, section 4, of the Principles of Medical Ethics. Publicity is given to this decision because the Council has information that at least one other organization is anticipating a similar procedure.

Respectfully submitted.

GEORGE EDWARD FOLLANSBEE, Chairman.
WALTER F. DONALDSON.
HOLMAN TAYLOR.
JOHN H. O'SHEA.
EDWARD R. CUNNIFFE.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

1. The Council on Medical Education and Hospitals has endeavored to perform the functions assigned to it in chapter IX, section 2, of the By-Laws of the American Medical Association, namely: (1) to investigate conditions of medical education, including premedical, undergraduate and graduate medical education, hospitals and associated subjects and to suggest means and methods by which the same may be improved; (2) to endeavor to further the realization of such suggestions as may be approved by the House of Delegates. At the same time there are new conditions to be faced. The Chairman of the Council has well said that the Council should assume responsibility for seeing that medical education and medical institutions are not hampered or destroyed, or even materially handicapped, by any war emergencies and that medical schools should continue to perform their task of preparing as large a number of well trained men and women in the field of clinical medicine as their physical and clinical facilities permit.

2. As of March 1, 1941 sixty-six four year medical schools in the United States are approved, one of which is on probation. In Canada there are nine approved medical schools. In the United States ten schools of the basic medical sciences are included in the approved list, two of them on probation. In Canada there is one approved school of the basic medical sciences. There is also in the United States one school offering only clinical courses which is approved. This institution has announced, however, that it will accept no more students.

Eleven medical schools were visited during the year and from eight special reports of progress were received.

For the session 1939-1940, eleven medical schools officially stated that two years of college preparation were required for admission. Actually, however, only 2 per cent of the students admitted in 1939 had less than three years of preliminary training. For the session 1940-1941, nine schools reported a two year college prerequisite.

3. In the Selective Service Act of 1940 there is no provision for the exemption or deferment of medical students as such. Medical students, like all other students, are placed in class I-D, which grants them deferment until July 1, 1941. In some localities they have been deferred for even longer periods. It should not be necessary to argue that a continuing and undiminished supply of well trained physicians is absolutely essential to the welfare of the nation, and it is urged that the House of Delegates, by all means in its power, bring to the attention of those in authority the disastrous consequences of any interruption or even impairment of the present program for the education of physicians.

4. The faculties of medical schools have been classified with respect to availability for medical service in national defense. An alphabetical list of essential faculty members is now in the possession of the Surgeon General of the United States Army and of the surgeon of each corps area.

The Council's study of continuation courses for practicing physicians is being continued by means of questionnaires, and the results have been published annually in the Educational Number of THE JOURNAL. Beginning in October 1937 nearly every state was visited by a representative of this Council. It is hoped that this study can be continued by field work and questionnaire.

Considerable progress has been made in the compilation of material for a volume to constitute Part II of the Council's study of graduate medical education, which will deal with institutional apprenticeships, namely internships, residencies and fellowships. It is expected that this publication will be available in 1941.

5. Statistics regarding hospitals published in THE JOURNAL for March 15, 1941 were obtained in the customary manner. It is gratifying to record that the Council has again received from hospital authorities the most generous assistance and cooperation. The information requested was supplied by 99.1 per cent of all institutions to which the census blank was sent, representing 99.8 per cent of all hospital beds.

There can be no doubt that the administrative officers of the hospitals are both annoyed and confused by the multiplicity of surveys which are being made. Some of these are quite unnecessary and merely duplicate activities which have long been carried on by other agencies to the satisfaction of all concerned.

According to the published data there were 6,291 hospitals included in the Hospital Register, an increase of 65 over the data published in 1940. The total number of beds was 1,226,245, an increase of 31,219. The number of births totaled 1,214,492, an increase of 117,542. Occupancy in general hospitals was found to be 70.3 per cent. The number of government hospitals increased by 26, a gain of 28,072 beds, while the nongovernment hospitals increased by 39, a gain of 3,147 beds.

Admissions in government hospitals increased from 2,734,375 to 2,853,012 and in nongovernment hospitals from 7,144,869 to 7,231,087. The average daily census in government hospitals was 23,583 higher than in 1939 and in the nongovernment hospitals 9,554 higher.

Occupancy in general hospitals exceeded 70 per cent in fifteen states and 60 to 70 per cent in twenty-five states.

There was found to be more than 5 general hospital beds per thousand of population in six states, 4 to 5 in nine states and 3 to 4 in sixteen states.

6. The Council has collaborated with the American College of Surgeons so that in the collection of hospital data the same forms are used by the two organizations, which the hospital administration is required to fill out only once.

7. On March 1, 1941 there were 730 hospitals approved for the training of interns, a decrease of 6 over a year previous. In these hospitals there were offered approximately 6,700 internships annually. Vacancies or unfilled intern appointments amounted to 615 on Dec. 31, 1940 as compared with 344 for the year previous. On March 1, 1941 there were 610 hospitals approved for residencies in specialties. In these hospitals 5,257 residencies are offered.

8. During 1940, 229 hospitals were inspected by members of the staff of the Council as follows:

Hospitals offering:

(a) Internships	88
(b) Residencies and fellowships.....	59
(c) Internships and residencies.....	76
Hospitals desiring registration.....	6

229

A total of 348 individual residencies and fellowships were investigated in the course of the inspections.

9. The Council is the only agency in a position to do anything about the more than 3,000 small hospitals which are not surveyed by the American College of Surgeons. With an increase in staff which has been authorized by the Board of Trustees, the Council will be able to pay more attention to institutions in this group.

10. The status of that part of the Council's activities which deal with schools for technicians is as follows:

Schools for Clinical Laboratory Technicians:

On approved list beginning of 1940.....	154
Inspected during 1940.....	24
Approved during 1940.....	9
Removed from list.....	9
On approved list March 1, 1941.....	154

Schools for Physical Therapy Technicians:

On approved list beginning of 1940.....	16
Inspected 1940.....	2
Approved during year.....	0
Removed from list in 1940.....	0
On approved list March 1, 1941.....	16

Schools of Occupational Therapy:

On approved list beginning of 1940.....	6
Inspected in 1940.....	0
Approved during year.....	0
Removed from list in 1940.....	0
On approved list March 1, 1941.....	6

11. In 1940, 5,879 physicians obtained their first license to practice medicine. Quality, however, is more important than quantity, and in this respect the situation is less satisfactory. There were 186 graduates of unapproved medical schools admitted to practice in 11 states. A still more serious degradation of the standards of medical practice results from the attempts in recent years to abolish the restrictions which have heretofore governed the practice of osteopathy. In 9 states unrestricted medical licenses have been issued to 118 osteopaths. In 1940 also 1,015 licenses were issued to graduates of foreign faculties of medicine. These data will appear in the State Board Number of *THE JOURNAL*, May 3, 1941.

12. Major publications during 1940 compiled by the Council and widely distributed included:

Hospital Service in the United States.
State Board Number of *THE JOURNAL*.
Medical Education in the United States and Canada.
Proceedings of the Annual Congress on Medical Education and Licensure.
Choice of a Medical School.
Approved Colleges of Arts and Sciences.
Schools for Clinical Laboratory Technicians.
Schools for Physical Therapy Technicians.
Schools for Occupational Therapy.

13. The Council, during 1940, was represented at the following meetings:

American Medical Association, New York.
American Medical Association, Conference on Industrial Health, Chicago.
Annual Congress on Medical Education and Licensure, Chicago.
American College of Surgeons, Chicago.
American Hospital Association, Boston.
Catholic Hospital Association, St. Louis.
Tri-State Hospital Association, Chicago.
Illinois Catholic Hospital Association, Chicago.
American Physiotherapy Association, New York.
American Association of Record Librarians, Chicago.
Association of American Law Schools, Chicago.
National League of Nursing Education, New York.
American Council on Education, Washington, D. C.
Institute for Hospital Administrators, Chicago.
American College of Dentists, Cleveland.

14. Exhibits were prepared for:

American Medical Association.
American College of Surgeons.
American Hospital Association.
Catholic Hospital Association.
Illinois Catholic Hospital Association.
Tri-State Hospital Association.
Annual Congress on Medical Education and Licensure.

15. Dr. Reginald Fitz, Boston, a member of the Council, is making a study of intern health which will, it is expected, be presented before one of the sections of the Scientific Assembly.

16. Concerning the resolution adopted by the House of Delegates in 1938 requesting the Bureau of Medical Economics and the Council to undertake a study of the practice in hospitals of pathology, radiology, anesthesia and physical therapy, it is necessary to report that on account of the extra work involved in the Association's program of national preparedness and because of the handicaps imposed by the Government's prosecution of the officers of this Association, the Bureau and the Council are not yet in a position to report.

Respectfully submitted.

*Deceased April 8, 1941.

REPORT OF THE COUNCIL ON
SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association:

Meetings of the Council on Scientific Assembly were held during the annual session of the Association in New York, and the regular interim meeting took place in Chicago on Dec. 13, 1940, at which time the annual conference of the Council with the section secretaries was held.

SECTION ON ANESTHESIOLOGY

The House of Delegates at the annual session in 1940, acting on the recommendation of the Council, created the Section on Anesthesiology, so that there are now seventeen sections of the Scientific Assembly.

The Council appointed the following officers for the new section:

Chairman, Dr. Ralph M. Waters, Madison, Wis.
Vice Chairman, Dr. T. J. Collier, Atlanta, Ga.
Secretary, Dr. John S. Lundy, Rochester, Minn.
Delegate, Dr. Henry S. Ruth, Merion Station, Pa.
Alternate Delegate, Dr. C. F. McCuskey, Glendale, Calif.
Executive Committee: Dr. Henry S. Ruth, Merion Station, Pa.; Dr. John H. Evans, Buffalo; Dr. Ralph M. Waters, Madison, Wis.

CHANGE IN NAME OF SECTION AND REQUEST
FOR NEW SECTION

The Council again considered, at its meeting in December 1940, the proposal to combine the Section on Pharmacology and Therapeutics and the Section on Pathology and Physiology. The recommendation is offered to the House of Delegates that the name of the Section on Pharmacology and Therapeutics be changed to "Section on Experimental Medicine and Therapeutics."

A request was received during the year for the establishment of a Section for the General Practitioner. It was the opinion of the members of the Council that this would be a duplication of existing sections and that, since the scientific programs are being made more in keeping with the interest of the general practitioner, it does not feel that a new section of this type would be desirable.

THE SCIENTIFIC PROGRAM

The Official Program of the Cleveland session is submitted as a part of the Report of the Council on Scientific Assembly.

At the St. Louis session in 1939 the policy of having a part of the program of the General Scientific Meetings composed of contributions from physicians residing in the city in which the annual session of the Association is held was inaugurated and was continued at the New York session last year. This innovation was so favorably received at St. Louis and at New York that the Council has arranged for a similar program at the Cleveland session, at which the General Scientific Meetings on Monday afternoon, June 2, will be devoted to presentations by local physicians. On Tuesday morning, June 3, the General Scientific Meetings will be devoted to a panel discussion on poliomyelitis, and on Tuesday afternoon timely and important discussions on the Relation of American Medicine to National Defense will be presented.

The Council on Scientific Assembly wishes to express its grateful appreciation for the faithful and efficient service performed by the officers of the scientific sections and to extend its thanks to all those who will appear as contributors to the official program.

Respectfully submitted.

JAMES E. PAULLIN, Chairman.
SAMUEL P. MENGEL.
CLYDE L. CUMMER.
J. GURNEY TAYLOR.
A. A. WALKER.
FRANK H. LAHEY, President-Elect.
MORRIS FISHBEIN, Editor, *THE JOURNAL*.
OLIN WEST, Secretary.

} Ex officio.

AMERICAN MEDICAL ASSOCIATION ON TRIAL

THE TRIAL OF THE CASE OF THE UNITED STATES OF AMERICA
VS.

THE AMERICAN MEDICAL ASSOCIATION, A CORPORATION, THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA, A CORPORATION, THE HARRIS COUNTY MEDICAL SOCIETY, AN ASSOCIATION, THE WASHINGTON ACADEMY OF SURGERY, AN ASSOCIATION, ARTHUR CARLISLE CHRISTIE, COURSEN BAXTER CONKLIN, JAMES BAYARD GREGG CUSTIS, WILLIAM DICK CUTTER, MORRIS FISHBEIN, THOMAS ALLEN GROOVER (DECEASED), ROBERT ARTHUR HOOE, ROSCO GENUNG LELAND, THOMAS ERNEST MATTINGLY, LEON ALPHONSE MARTEL, FRANCIS XAVIER MCGOVERN, THOMAS EDWIN NEILL, EDWARD HIRAM REEDE, WILLIAM MERCER SPRIGG, WILLIAM JOSEPH STANTON, JOHN OGLE WARFIELD JR., OLIN WEST, PRENTISS WILLSON, WILLIAM CREIGHTON WOODWARD, WALLACE MASON YATER, JOSEPH ROGERS YOUNG.

MARCH 20 (CONTINUED)

TESTIMONY OF DR. MORRIS FISHBEIN

DIRECT EXAMINATION

By Mr. Leahy:

Dr. Morris Fishbein, Chicago, said his official position is Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and Managing Editor of all publications. He has the degree of Doctor of Medicine from Rush Medical College of the University of Chicago in 1912. He was born in 1889, July 22. Following graduation in medicine he received the alumni fellowship in pathology from Rush Medical College and was appointed resident physician in the Durand Hospital for Infectious Diseases, of the McCormick Institution for Infectious Diseases, and at the same time assisted the Coroner's Physician of Cook County in the making of postmortem examinations. He began doing postmortem work during the first part of 1912 and continued that through 1912 and 1913. He did not engage in the private practice of medicine. He became assistant to the Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION on Aug. 27, 1913, and in 1924 was appointed Editor. He had been constantly with the American Medical Association for about twenty-seven years.

Q.—As Editor of THE JOURNAL what was your duty, Doctor?

A.—As Editor of THE JOURNAL I have charge of all material which is published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, including the scientific contributions, the editorials, the news material, abstract of scientific literature, answers to questions—all material published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. I take the responsibility for it and am responsible to the Board of Trustees.

Q.—THE JOURNAL is a weekly journal, is it not? A.—A weekly publication.

Q.—What is its distribution? A.—The circulation is 101,300 subscribers.

Q.—Made up mostly of whom? A.—Well, it is made up mostly of physicians, although I venture to say that at least four thousand copies go to libraries, medical schools, institutions of research and similar places.

Q.—Have you yourself been the author of any articles or books? A.—I have written about eighteen books that have been published by various publishers, some medical books and some general advice books; some scientific expositions, some exposures of quackery. I have written several hundred articles, of which six or seven dealt wholly with scientific research.

Q.—Are you a member of any societies? A.—I am a member of the American Association for the Advancement of Science, of the American Public Health Association, of the American Medical Historical Association, a Fellow of the American Medical Association, a member of the Chicago Pathological Society, of the Chicago Society of Medical History, and many other organizations.

Q.—Are you also a member of any of the committees engaged in national defense? A.—I am a member of the Committee on Medical Preparedness of the American Medical Association. I am a member of the Executive Committee of the Division of Medical Sciences of the National Research Council. I am chairman of the Committee on Information of this division of the National Research Council.

Q.—Now, Doctor, with reference to THE JOURNAL itself and more particularly with reference to those articles which are of a scientific nature, what character or type do those articles take? A.—We receive for publication each year three thousand articles that discuss every phase of scientific medicine, including surgery, diseases of the skin and of the nervous system and practically every other disease which may occur to man and even, sometimes, to animals; and we select from those three thousand articles approximately six hundred which are considered acceptable for publication.

Q.—Doctor, in presenting questions of a scientific nature do you present questions which are in any way controversial? A.—Very frequently controversial questions are presented and published from many different points of view. For example, what is the best method of treating pneumonia? Physicians might vary as to certain new techniques. We would naturally present the various techniques.

Q.—Referring more particularly to an answer which was given by Dr. Cabot with reference to scientific articles in THE JOURNAL, you will recall that he stated that some of them were presented in such a way that they could be torn limb from limb. A.—No; I think Dr. Cabot stated that, as far as the scientific aspects of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION were concerned, he considered it probably the best in the world.

Q.—I think he also stated that there were some of the articles that he thought if they came before scientific bodies could be torn limb from limb. A.—He was referring, I am quite sure, to specific articles not dealing with the scientific aspects of medical science.

Q.—Doctor, do you recall when it was that your attention was first attracted to Group Health Association? A.—Well, I am by profession, at least one profession, a journalist, and I am quite sure that I began to hear vague rumblings concerning something that later turned out to be Group Health Association, fairly early in 1937.

Q.—1936 or 1937? A.—1937. Of course if I started now to go all the way back I would say that I heard the antecedents of Group Health Association discussed at least twelve years ago by Mr. Filene.

Q.—Can you recall now about when in 1937 it was you first heard about Group Health Association? A.—Well, only approximately. I would have no very definite memory of that, I am sure, because, as I heard it, it was probably in the nature of "There is something going on." I cannot tell exactly who may have made the statement to me, but some one must have said to me, some time in the early part of that year, "Some one is figuring on starting another plan in Washington."

Q.—Did you attend the convention of the American Medical Association in June of 1937 at Atlantic City? A.—I did.

Q.—Do you recall whether at that convention you heard anything at all about Group Health Association? A.—I am quite sure I did. My recollection of it is not too bright at this particular moment, but it has been reinforced by attendance in the court, so that I can recall that such a thing went on.

Q.—Do you recall when, following the convention in 1937, if at all, your attention was again attracted to G. H. A.? A.—Well, I left the United States in the middle of July of that year. In fact, I left Chicago on July 12 and went to England as a guest of the British Medical Association, and then went to Sweden, Denmark, Holland, and several other countries, and I did not return until about the first of September. But I now

recollect that on the second day out on the boat I was with Mr. Filene for an hour or two—he happened to be on the boat also—and he did mention the matter to me at that time.

Mr. Lewin:—I object.

By Mr. Leahy:

Q.—Did you, while you were away, and save and except the chat which you had with Mr. Filene, hear anything about Group Health Association? *A.*—Not a thing. I never heard about it nor had anything to do about it at all during that period from July 12 to the first of September.

Q.—Up to the time that you left on July 12, and following the convention at Atlantic City, do you recall that you heard anything about G. H. A.? *A.*—No.

Q.—Did there come a time—*A.*—Just a moment. I believe there was a meeting of the Executive Committee of the Board of Trustees about June 29, and I believe I attended that meeting of the Executive Committee of the Board of Trustees on June 29.

Q.—Do you remember who it was that constituted the Executive Committee of the Board of Trustees at that time? *A.*—It would be my impression—and this, again, is only memory; I cannot be certain—probably Dr. Bloss, Dr. Hayden and probably Charles B. Wright; and at such a meeting Dr. West would be present.

Q.—Were you present yourself? *A.*—I believe I was present.

Q.—Without going into the details, if the Executive Committee at that time took any action whatsoever in which you became interested with reference to G. H. A., tell us what it was. *A.*—I believe that about that time, at that meeting, there was some discussion of Group Health Association, and the suggestion was made that an article be published in *THE JOURNAL* giving available facts concerning the organization.

Q.—Then shortly thereafter I think you stated you went away and were gone for the summer? *A.*—Yes.

Q.—Before you went away and from the time that you had heard the rumblings about G. H. A., as you stated, personally had you done anything whatsoever with reference to finding out anything about G. H. A., its status, or anything of that kind? *A.*—Nothing whatever.

Q.—Had you ever discussed the matter with anybody whom you now can recall, looking toward finding information about G. H. A.? *A.*—As far as I know, nothing whatever.

Q.—Had you ever come to the District of Columbia to interview anybody in the Medical Society here? *A.*—I did not.

Q.—Did you have any correspondence with anybody in the District of Columbia Medical Society? *A.*—I have no recollection of any such correspondence.

Q.—Did you have occasion to meet any committee of the Medical Society of the District of Columbia? *A.*—No; I have never met with any committee of the District of Columbia Medical Society; certainly not on this subject or anything related to it.

Q.—In your capacity as the Editor of *THE JOURNAL*, Doctor, what connection do you keep with the heads of the various bureaus or councils of the American Medical Association? *A.*—Material prepared for publication by the heads of various departments or bureaus or councils and others comes eventually to my desk for publication, and as I have the responsibility for material published in *THE JOURNAL* and am responsible to the Board for such material, I naturally do with such an article—in fact, even scientific articles which would then be referred back to their authors—I naturally do what is called the editing of the material.

Q.—What have you to do in your capacity as editor with the operation or the administration of any of the various bureaus of the American Medical Association? *A.*—I have no authority in the administration of any of the bureaus of the American Medical Association or over any of the councils of the American Medical Association.

Q.—What has been the custom or practice with reference to doing anything with regard to the administration of the various bureaus? *A.*—I certainly make no attempt to administer any of the bureaus. I would say, again, that I take the responsibility for what is published by such a bureau, and am responsible to the Board.

Q.—To be a little more specific, before your going to Europe, as you have related, on the 12th day of July, do you recall now that you ever had a conversation with Dr. Cutter about G. H. A.? *A.*—Certainly not.

Q.—Or Dr. Leland? *A.*—Certainly not.

Q.—Beyond the meeting of the Executive Committee of the Board of Trustees, any meetings with reference to Dr. West about G. H. A.? *A.*—Certainly not.

Q.—Had you ever formulated any plans about G.H.A.? *A.*—Nothing whatever.

Q.—Had you ever discussed anything with anybody with relation to anything affecting G. H. A. other than what you stated the Executive Committee authorized with respect to the publication of articles? *A.*—Nothing whatever.

Q.—After the Executive Committee authorized the publication of articles, what did you do toward collaborating or formulating articles? *A.*—Again I must refer to my memory, and keeping in mind the vast amount of material for which I am responsible as an editor and as an author, I would say that the article came to my desk with a memorandum from Dr. Woodward; that I then indicated certain changes which I thought desirable previously to publication, and that I then probably returned the article to Dr. Woodward, no doubt by a messenger, or perhaps just by dropping it in the basket; that I then returned the article to Dr. Woodward with the statement that I considered certain changes necessary.

Q.—Beyond that what else did you do with reference to the article itself? *A.*—Nothing whatever.

Q.—To be more specific, with reference to those who have been indicted in this case as defendants, Doctor, when, if ever, did you meet Dr. Arthur Carlisle Christie? *A.*—Outside of some meeting that had nothing to do with any of this, a good many years ago, I met Dr. Christie at dinner here in Washington on Feb. 10, 1938.

Q.—Dr. Coursen Baxter Conklin? *A.*—I do not recollect that I met Dr. Conklin.

Q.—Dr. James Bayard Gregg Custis? *A.*—I do not recollect any meeting or conversation with him.

Q.—Dr. Thomas Allen Groover, in his lifetime? *A.*—I had not had any conversation with him on this matter.

Q.—Dr. Robert Arthur Hooe? *A.*—Nothing.

Q.—Dr. Leon Alphonse Martel? *A.*—Nothing.

Q.—Dr. Thomas Ernest Mattingly? *A.*—Nothing.

Q.—Dr. Francis Xavier McGovern? *A.*—Nothing.

Q.—Dr. Thomas Edwin Neill? *A.*—I believe Dr. Neill introduced me at the address which I made at Georgetown University on Feb. 10, 1938.

Q.—Is that the same occasion when you met Dr. Christie? *A.*—Yes. I had dinner on that occasion with Dr. Christie and, I believe, Dr. Cavanaugh and Dr. Gwynn, and then I believe, later, Dr. Neill introduced me to the audience at the forum.

Q.—Dr. Edward Hiram Reede? *A.*—No connection.

Q.—Dr. William Mercer Sprigg? *A.*—No connection.

Q.—Dr. William Joseph Stanton? *A.*—Nothing.

Q.—Dr. John Ogle Warfield Jr.? *A.*—Nothing.

Q.—Dr. Prentiss Willson? *A.*—Nothing, so far as I can remember, and no correspondence and no discussions with any of those gentlemen.

Q.—Dr. Wallace Mason Yater? *A.*—I believe all my correspondence with Dr. Yater has been of a wholly scientific character, dealing with medical publications and books.

Q.—Dr. Joseph Rogers Young? *A.*—Not that I remember.

Q.—Doctor, on your return in September 1937, aside from the publication of the article on Oct. 2, 1937 appearing in *THE JOURNAL*, what else had you to do with reference to anything relating to G. H. A.? *A.*—It would be my impression that I sat with the Board of Trustees at its September meeting previously to the publication of the article, and it would also be by impression that I was present at the meeting of the State Secretaries and Editors, since it was my usual custom to be present at such meetings, and the article itself was published, I believe, previously to the meeting of the State Secretaries. I was probably present also at the meeting of the Board of Trustees in November.

Q.—1937? *A.*—1937.

Q.—Were you present at the meeting of November 6 in which Drs. Woodward, Leland and West met with Dr. McGovern and Dr. Hooe? *A.*—On that day I was in New Orleans.

Q.—How long were you in New Orleans at that time? *A.*—I arrived in New Orleans on the 4th of November and spent about four days there, so that I was there on November 6.

Q.—Do you recall now anything which was said or which was done at the meeting of the Association of editors of the various state and constituent organizations which was held that

fall in Chicago? *A.*—I have, again, a rather dim memory that there was an exposition of the development of Group Health Association; that the general character of the matter was discussed, and, again, reinforcing my recollection to some extent by what I have heard here in the court, I believe an attempt was made to introduce and pass a resolution. But I happen to know that that body has no authority to pass any resolutions that are binding in any way on anybody. That is purely a conference where men discuss affairs, and they can take no action.

Mr. Lewin:—Was that the conference of Secretaries?

The Witness:—State secretaries and editors.

By Mr. Leahy:

Q.—Do you recall anything which was said or done in the meeting of the Board of Trustees which you attended? *A.*—I cannot recall anything special that was done.

Q.—Are you a member of the Board of Trustees? *A.*—No; I have no official position of that character, but as Editor, and being responsible for all the publications and taking orders from the Board of Trustees as to material that is to be disseminated, I sit with the Board at its meetings.

Q.—How many other publications besides *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* do you edit for the American Medical Association? *A.*—I am Editor of *Hygieia*, which is the health magazine published by the American Medical Association for the general public. I am editor of the *Quarterly Cumulative Index Medicus*, which is a quarterly index of some fifteen hundred medical periodicals, the material being indexed so that we keep track of what it going on throughout the world. I am also managing editor of a periodical devoted to nervous and mental diseases, one for pathology, one for the nose, throat and eye, internal medicine, surgery, and I am also chief editor of *War Medicine*, which is published in cooperation with the National Research Council and with the cooperation of the Army and Navy and the Public Health Service.

Q.—Doctor, following the meeting of the Board of Trustees in November do you recall whether at any time you had anything to do with G. H. A. in any way, shape or form? *A.*—Well, I made a speech on February 10 at Georgetown University at which some people asked some questions about G. H. A. and in which I gave some discussion of group health in general. I think the title of my address was American Medicine or Medicine and the Changing Social Order, or something like that.

Q.—Was that an open forum? *A.*—It was an open forum conducted by Georgetown University. I think there were about twelve hundred people there, mostly laymen.

Q.—Beyond that can you recall anything else which was done by you or said by you that had any relation to G. H. A.? *A.*—Perhaps in one or two other addresses before public forums elsewhere in the country, not more than two or three—I have tried to refresh my recollection on this by looking through every record I could find—I may have occasionally devoted three or four sentences in my discussion to Group Health Association as just one type of maybe several hundred, if not thousands, of plans that are now being experimented with in this country.

Q.—Did you at any time following your return from Europe confer with any of the members of the District Medical Society? *A.*—I have not so conferred with them at any time. As far as I can remember, I have never had a conference with anybody in the District of Columbia Medical Society on the question of Group Health Association.

Q.—Did you ever attend a meeting of the District Medical Society? *A.*—I believe I did a good many years ago. I spoke at one of their meetings here.

Q.—I mean, during the period in 1937 and down to December 20. *A.*—No meeting in which I had anything to do with Group Health Association.

Q.—Did you ever attend any committee meetings of the District Medical Society? *A.*—I was never invited to attend any committee meeting, and I never go without an invitation.

Q.—Did you ever at any time during 1937 and 1938 discuss with or write to any official of the District Medical Society with reference to Group Health Association? *A.*—In response to the subpoena of the Government I instructed my secretaries to dig out every letter from my files in which they could find that I had had any correspondence that might have even remotely related to this, and I turned over to the Government every such letter. So far as I know there was introduced in evidence here a letter addressed to me by a boy named Fred Hammerly which did not discuss Group Health Association, and I answered his letter. He then responded, and his second

letter I referred to Dr. West. That would be the only correspondence of which I have any knowledge.

Q.—I am going to show you now Exhibit 282 for the prosecution, a letter from Hammerly to Dr. Fishbein. *A.*—I can pretty near tell you what it says, I think.

By Mr. Leahy:

Q.—I now show you this letter. There is only one, I think, that you wrote? *A.*—Yes.

Q.—Is that the letter? *A.*—I am quite sure that is the letter I wrote to Fred Hammerly. That is my letter; yes.

Mr. Leahy:—It is dated Sept. 30, 1938 and addressed to Dr. Fred Hammerly, Brooklyn, N. Y.:

"Dear Dr. Hammerly:

"I am referring your letter of September 24 to Dr. Olin West, Secretary of the American Medical Association, who is a member of the Judicial Council and who can best advise you regarding the question in which you are interested.

"Very truly yours."

By Mr. Leahy:

Q.—Doctor, you were here in the court room, were you not, when Dr. Cabot gave his testimony? *A.*—Yes, sir.

Q.—With reference to that testimony, I want to ask you, Doctor, whether quite a different policy has been established in regard to the section on Medical Economics in *THE JOURNAL* than that which had existed hitherto? *A.*—No doubt Dr. Cabot meant to imply by that statement that we were not as broad in our general admission of discussions relating to so-called medical economic matters as we are in relation to scientific matters. There might be a fair difference of opinion on that point. In fact, I could produce a list of many hundreds of articles discussing every possible aspect of the distribution of medical service.

Q.—Do you edit all the articles on economic questions and medical economics that appear in *THE JOURNAL*? *A.*—I am responsible as editor for every article and, in fact, for everything else that appears in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*.

Q.—What have you to say with reference to the statement that the articles in *THE JOURNAL* are a pretty incomplete statement with very important omissions therefrom? *A.*—That, of course, is to my mind absolutely unwarranted, for the simple reason that I have published many, many articles describing every possible technic in the distribution of medical service.

Q.—On questions wherein there is any discussion whatsoever with reference to medical economics, do you "omit source material so that the busy physician who cannot possibly go to original sources is not able to get a complete picture"? *A.*—Well, if Dr. Cabot meant that I did not publish the twenty-seven volumes of the Committee on the Costs of Medical Care—he may perhaps refer to that as source material—he was correct; obviously we print vast amounts of source material. I might refer, for instance, to an article printed long before Group Health Association appeared on the scene, dealing with various technics for distribution of service and on different types of payment.

Q.—I want to ask you, Doctor, if *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* has adopted any policy whereby the possibility of pointing out omissions and weaknesses in articles published has been frowned on? *A.*—I think when Dr. Cabot made that statement he disregarded the fact that I have published on at least five occasions statements made by Dr. Cabot himself, discussing such matters.

Q.—Has *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* in its field of discussion of medical economics and such subjects and problems been on both sides for criticism each of the other? *A.*—We have published on many occasions criticism by two sides of various technics for the distribution of medical service. In that connection it is obviously the duty of an editor always, first of all, to protect his reader, so that if an article is received with obvious misstatements of fact it would be a very poor editor who would publish it just because it came from the opposite side.

Q.—I wish to show you, Doctor, a couple of letters in which your name has been mentioned. Will you kindly look at that and see if you can identify it in any way? *A.*—That is a letter which I wrote.

Q.—I am going to show you a carbon copy of a letter which has been identified as Exhibit 281 and offered in evidence under that identification number, dated Sept. 19, 1938 and ask you if you had anything to do with the writing of the original of which that appears to be a carbon? *A.*—No. That deals with a letter which was sent to me by Dr. Arthur W. Erskine on Sept. 19, 1938 and in my reply I told him that I had read his letter with interest and was sending it to Dr. West.

Q.—This is a letter dated Aug. 27, 1938. A.—To Mr. M. K. Heartfield, Washington, D. C. The letter was written on Aug. 27, 1938.

Q.—Have you any independent recollection now with reference to the occasion of your writing the letter of Aug. 27, 1938? A.—I believe that Mr. Heartfield, who is a citizen of Washington, D. C., was visiting in Chicago and I played golf with him; in the course of playing golf, knowing that he had a good many employees in his plant, and being, as I have stated, journalistic by instinct, I asked him as to how his employees felt about all this excitement down here, that I knew was going on in Washington.

Mr. Leahy:—Exhibit 291-A, dated Aug. 27, 1938, is on the official stationery of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, addressed to Mr. M. K. Heartfield, Washington, D. C.:

"Dear Mr. Heartfield:

"I appreciate your letter of August 23, together with the information that it contains. This is most heartening as indicating the public reaction in Washington toward Group Health Association activities. I am referring your letter to Dr. Olin West, Secretary of the Association, and Dr. R. G. Leland.

"With best wishes and with the hope of seeing you sometime soon, I am
"Sincerely yours."

Exhibit 281 is a carbon copy of a letter dated Sept. 19, 1938, addressed to Dr. Arthur W. Erskine at Cedar Rapids, Iowa, and it reads as follows:

"I have read with great interest your letter of September 9 and also the material sent to you by A. H. Woods. I am sending your letter also to Dr. Olin West, since it is addressed jointly to him. I believe that the action taken by the House of Delegates, which is reported in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for September 24, will indicate to you the progress that has been made. I will be much interested in hearing your comment as to the action taken by our House of Delegates.
"Very truly yours."

By Mr. Leahy:

Q.—Do you know whose initials they are that appear on that? A.—"Z. W." is one of my secretaries.

Q.—Doctor, you are familiar, are you not, with the Principles of Medical Ethics of the American Medical Association? A.—I would say that I am familiar. I lecture on the history of medical ethics in a medical school.

Q.—Do you know how long the fundamental principles of medical ethics have been in force? A.—That question has been answered by six or seven previous witnesses, and it is a very, very difficult question to answer in a single sentence. If you cared to take a minute and a half I can probably answer it.

Q.—I will not take quite that much time. Do you recall when the framework of the principles occurred? A.—The framework was developed in Manchester, England, and was first published in 1803. It was first published after Percival secured opinions from Erasmus Darwin, William Heberden, and William Withering and others had given their opinions. The first draft was published in about 1803, and a modified draft was adopted by the American Medical Association in 1848. It was written by Isaac Hayes, who was then editor of the *American Journal of the Medical Sciences* in Philadelphia. Since that time there have been modifications of the fundamental principles primarily with the object of covering new developments in both the scientific and what might be called the general nature of medical practice.

Q.—I want to ask you whether, under those principles of Medical Ethics as interpreted by the American Medical Association and its affiliated constituent and component societies, they can and frequently do condemn as unethical group medical practice on a risk-sharing prepayment basis, principally because such practice is in business competition with and threatens the incomes of doctors engaged in practice on a fee-for-service basis, and particularly of doctors so practicing who are members of defendant American Medical Association and its affiliated constituent and component societies? A.—To use a phrase which I sometimes use in addressing the public regarding various other matters, I would say that there is not the slightest scientific or authentic evidence in support of such a statement.

Q.—Are the American Medical Association and its affiliated constituent and component societies interpreting the rules of ethics principally because, in so far as the risk-sharing prepayment basis of medical practice is concerned, there is competition from the money angle between fee-for-service practice as compared with group practice? A.—Again, I would say that from long tradition everything that is taught to every medical student in every qualified medical school is absolutely opposed to any such concept of medical practice.

Q.—I want to ask you, Doctor, whether at any time, anywhere, you ever combined and conspired together for the purpose

of restraining trade in the District of Columbia? A.—Absolutely not.

Q.—Did you (1) combine and conspire together with anybody at any time at any place for the purpose of restraining Group Health Association, Inc., in its business of arranging for the provision of medical care and hospitalization to its members and their dependents on a risk-sharing prepayment basis? A.—No.

Q.—(2) For the purpose of restraining the members of Group Health Association, Inc., in obtaining by cooperative efforts adequate medical care for themselves and their dependents from doctors engaged in group medical practice on a risk-sharing prepayment basis? A.—No.

Q.—(3) For the purpose of restraining the doctors serving on the medical staff of said Group Health Association, Inc., in the pursuit of their calling;

(4) For the purpose of restraining doctors, not on the medical staff of Group Health Association, Inc., practicing in the District of Columbia, including the doctors so practicing who are made defendants herein, in the pursuit of their calling;

(5) For the purpose of restraining the Washington hospitals in the business of operating such hospitals.

Doctor, did you ever do anything, write anything, or discuss with anybody anything, with reference to the Washington hospitals during this period from January 1937 to December 1938? A.—Absolutely no.

Q.—Do you know anybody on the staff of Group Health Association? A.—No.

Q.—Did you ever, Doctor, at any time, endeavor or try to restrain anybody from becoming a member of the staff of Group Health Association? A.—Never.

Q.—Do you know anybody who is or ever was a member of the staff of Group Health Association? A.—That takes in a lot of territory, but to my knowledge I don't know now anybody on that staff and I can't say I know anybody who ever was on the staff of Group Health Association.

Q.—Did you ever, Doctor, do anything for the purpose of hindering or restraining Group Health Association, Inc., or any of its staff, or anybody else connected with Group Health, in any manner whatsoever? A.—No.

Q.—Do you know where the Group Health Association Clinic is? A.—I have heard it mentioned as being on I Street, and have heard the number, 1328 I Street, but I don't know where I Street is.

Q.—Did you ever go in there? A.—No.

Q.—Did you ever do anything so far as Group Health is concerned in the way of restraining them from conducting, operating, maintaining or otherwise carrying on this clinic? A.—No.

Q.—Is there anything which has escaped my attention in inquiring of you with reference to any connection which you may have had with reference to Group Health, which you can recall at this time? If there is, I wish you would suggest it. A.—I believe I published a current comment in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION somewhere along in December 1938 covering the hearings which had been held in Congress on the question of appropriations, pointing out that the report made on those by an organization in New York had so mutilated the report as to give a false impression of what had happened in the Congressional hearing. That was Congressman Woodrum's hearing. Outside of that, I have no other knowledge; that is my best recollection.

CROSS EXAMINATION

By Mr. Lewin:

Q.—I have only one or two questions. You work on a salary, do you not? A.—Yes.

Q.—And don't you work for a large corporation? A.—Fairly large.

Q.—On a salary? A.—Yes.

Q.—You told us, I believe, that when you asked Mr. Heartfield for a report on the situation in Washington, it was simply because you were journalistically minded? A.—I think so.

Q.—You wanted the news, whether good or bad; that is all you wanted? A.—What I wanted, and what I asked Mr. Heartfield specifically for, was this: He has a good many employees in his business here and, as I remember it, I said to him "I wonder how all this excitement interests the average citizen in Washington," I was interested in simply that one point, and I asked him to ask some of his employees what their reaction was to this whole thing.

Q.—You were simply interested in finding out the facts, whatever it might be, whether the news was good or bad? A.—Nobody wants bad news, but I was interested in the news.

Q.—And when you got the news it was mostly adverse to Group Health Association? A.—Frankly, I can't remember much about it. He found a disinterest among his employees.

Q.—Didn't you tell us that was heartening to you? A.—Interesting and heartening.

Q.—Heartening, not because it was just news, but because it was adverse to Group Health? A.—I wouldn't say that. That is not my interpretation. To me it was interesting that a movement that had so much pressure behind it interested so few.

Q.—The thing that was heartening in it was that you thought it was true? A.—Are you interested in my emotional reaction?

Q.—I want to know your mental state; you can keep the emotions out of it. A.—I said in the letter "This is heartening news"; I think it was heartening.

Q.—Let me ask you this: I think you attended this conference of secretaries and editors? A.—I think so; I am not sure.

Q.—And didn't you say you remembered some action being taken there? A.—I said I believe some one had attempted to offer a resolution but I said that from my knowledge of the nature of the organization that body is not authorized to adopt resolutions.

Q.—But you do remember that somebody did attempt to offer a resolution? A.—I think so.

Q.—And that you remember that the resolution was passed? A.—That I don't remember, and even if it was passed it would still have no effect.

Q.—I wasn't asking you about the effect; I was asking you whether it was passed. A.—I really don't remember.

Q.—I will hand you a photostatic copy of what purports to be your note to Dr. West and ask you if you can identify that. It is 287 for identification, it is not in evidence. A.—The note is mine unquestionably, to Dr. West.

Q.—Does it refer to an attached document? A.—It says "This copy of a resolution adopted by the secretaries of the state medical societies apparently did not fit in suitably any place in the minutes. I suppose you will file it."

Q.—This attachment is the resolution which they passed, is it not? A.—I don't know whether they did. He said "adopted." Yes, they passed it, and probably I didn't print it because they had no authority to pass it.

Q.—You said because it didn't fit in well with the minutes. A.—Those were not my words: I said "didn't fit in suitably."

Q.—I stand corrected. Now, that indicates it was an extraordinary action on the part of the secretaries to do that, doesn't it? A.—An action they had no authority to take.

Q.—But a little unusual? A.—No, in the height of their enthusiasm within the past several years they have passed several resolutions without authority.

Q.—You have no doubt that was a resolution that they passed? A.—If it is here I have no doubt they passed it.

Mr. Lewin:—I offer it in evidence.

Mr. Leahy:—I object to it; it seems to me it was offered once and rejected.

Mr. Lewin:—Yes, but in another connection.

By Mr. Lewin:

Q.—Are Dr. Conklin and Dr. Yater of the District Medical Society members of that conference? A.—I wouldn't know; you see there are forty-eight secretaries and twenty-seven editors, and I wouldn't remember that.

Mr. Lewin:—I think the record shows they were.

THE COURT:—I ruled this out once?

Mr. Lewin:—Yes, but this is on a different basis.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Dr. Fishbein, I think you took the responsibility for everything published in THE JOURNAL? A.—Subject to the auspices of the Board of Trustees.

Q.—And that means you took responsibility for a certain article published Oct. 2, 1937 in THE JOURNAL with respect to Group Health Association? A.—Yes.

Mr. Lewin:—That is all.

MARCH 21—MORNING

Mr. Leahy:—There are some by-laws which must be read some time. If the Court please, these are the by-laws of Group Health Association, Incorporated:

(Mr. Leahy then read the by-laws indicating the amendments made at various times. These will be published in full in the reprints of this testimony.)

TESTIMONY OF DR. CHARLES S. WHITE

DIRECT EXAMINATION

By Mr. Leahy:

Charles S. White, 1801 Eye Street N. W., Washington, D. C., said he is a surgeon. He graduated in 1898 and has specialized in surgery from 1908 to the present time. After graduation from George Washington University he spent two years in private practice and eight years in hospital experience at Emergency, George Washington and Columbia Hospitals and part of the time in New York. He is now professor of surgery in George Washington and head of the Department of Surgery in Gallinger and Doctors hospitals, and on the consulting board of four or five others, including Emergency, Garfield and Providence. He is head of the Department of Surgery in George Washington University Hospital and on several committees; on administration, and on admission to hospital privileges. He has been on the committee on admissions since 1934.

Q.—What is the Committee on Admissions at George Washington? A.—It is a committee composed of Dr. Mallory, Dr. Howard Kane and myself, to whom all requests for the privilege of practicing any branch of medicine in the hospital are referred. This committee makes a report to the staff, and the staff acts on these applications. We act as a small group to classify these applications and submit a report on the qualifications of any of these men who apply for privileges. Dr. Mallory has medicine; Dr. Kane, obstetrics and gynecology, and I have surgery.

Q.—You make a report to what staff? A.—The staff of the University of George Washington Hospital.

Q.—Who composes the staff; I do not mean the actual names, just generally? A.—I would say about forty or fifty men who have the privilege of practicing there, and teaching privileges, and certain duties regarding patients assigned to them; the teaching staff largely.

Q.—Does George Washington have two types or characters or forms of staff? A.—They have an appointed staff and then a courtesy staff, men who have no official connection with the hospital but who are allowed to visit the patients in it if they can qualify for such privileges.

Q.—By whom is the appointed staff appointed? A.—By the Board of Trustees of the University, I would say; that is the way I received my appointment.

Q.—Are you a member of the Board of Trustees? A.—No, sir.

Q.—You said your committee on applications, having investigated the application, referred it to a staff; to which staff are applications made? A.—The appointed staff.

Q.—What is the distinction between the appointed and courtesy staffs? A.—The appointed staff is appointed by the University authority to take care of patients, mostly free patients in the hospital and university; the courtesy staff is composed of those who are practicing physicians in Washington who can take a private patient there and treat such private patient themselves.

Q.—Doctor, what is the practice in George Washington with reference to admissions to the courtesy staff privileges? A.—Applicants who wish to avail themselves of this privilege have to fill out a printed form, in which they state their qualifications, their age, where they graduated, and the usual information regarding the education; the society to which they belong; the medical papers which they have written; what experience they have: this is on a printed form. This application then is read before the staff at a regular meeting, stating this Doctor So and So, with his qualifications, has applied for membership or privileges on the staff. Then these applications are turned over to me as Chairman of that committee. I sort them then: that part relating to surgery I keep, those relating to medicine go to Dr. Mallory; and those to obstetrics and gynecology are referred to Dr. Kane. I refer mine to the Academy of Surgery, because in 1934 or 1935 we decided to turn over to the Academy all applications for investigation by the Academy of any one applying for privileges in surgery in the hospitals in Washington. They try to make it a standard type of investigation, and our organization, that is the staff of George Washington—agree to send all our applications to this Academy of Surgery to act in an advisory capacity to us. So I take these applications and send them to the Secretary of the Academy of Surgery. He in turn, I presume, investigates them and sends us back the report, and when I receive that I take it back to the next regular meeting of the staff and read it and ask the staff to vote, or the Dean who presides, asks them to vote on the applicant; whether he will be admitted, whether action will be deferred, postponed, or denied; and depending on their action the applicant is notified of such action; and that is the end of my connection with it.

Q.—Is that the general routine for every application of that nature? A.—That is the actual routine; has been since 1934 or 1935.

Q.—Since you have been connected with the George Washington Hospital, or any of them here in Washington, what has been the practice of all the hospitals to your knowledge with reference to the right of a doctor to practice in a hospital without having obtained privileges to the staff? A.—No hospital permits a man to practice without such privileges unless it is a grave emergency; then, sometimes that is waived until he can make out the proper application.

Q.—Is that true of all hospitals? A.—All as far as I know. Q.—After the medical staff has voted on an application, is that application referred to any other governing body? A.—No, it goes to the Dean, or superintendent of the hospital, who happens to be the Dean, Dr. Hoedorn, and I think his secretary takes the matter up from that point on.

Q.—Are you a member of the Academy of Surgery? A.—Yes.

Q.—Are you on any committee of the Academy of Surgery which has to do with the investigation of qualifications of applicants to practice medicine? A.—Yes.

Q.—Do you recall an application having been made to George Washington University Hospital by one Dr. Raymond E. Selders? A.—I know there was one made by him, but I don't know the exact date.

Q.—Some time in November 1937, did you know a Dr. Raymond Selders personally? A.—No.

Q.—Have you ever met him? A.—No.

Q.—Now, when his application came into George Washington Hospital did you personally have anything to do with it? A.—No, his application came in and it was filed in the proper form, and turned over to me with the usual type of applications on a printed form; then I had something to do with it.

Q.—Do you recall how it happened to come to you, if it did? A.—That is the routine procedure. It goes to the administrator of the hospital and he in turn reads that out at the staff meeting, and turns them over to me. That is how I received it.

Q.—What did you do with it when you got it? A.—I referred it to the Academy of Surgery; that was the routine method of handling it.

Q.—Doctor, has the reference of any application for courtesy privileges in George Washington Hospital, or in George Washington University Hospital, to the Academy of Surgery anything to do with Group Health Association? A.—No, not so far as I know; I think I know.

Q.—How frequently or often are you compelled to turn applications, or do you turn applications over to the Academy of Surgery of those making application to George Washington Hospital? A.—All I get that apply for surgery are turned over to the Academy. I suppose in the course of a year, fifteen or twenty; sometimes each month, or sometimes we will skip a month, or two, but it is routine in my practice.

Q.—Do you recall whether you received any information from the Washington Academy of Surgery upon the application which you had forwarded of Dr. Raymond E. Selders? A.—Yes.

Q.—Doctor, did you, as Chairman of that committee, do anything to delay action on the application of Dr. Raymond E. Selders? A.—I had nothing to do with his application after it was turned over to the Academy of Surgery. As soon as we got it back it was read before the meeting of the staff of George Washington University Hospital. There is a period in the year when there is a vacation, during the summer months, and that would be the only delay that I can think of.

Q.—After you received word from the Academy of Surgery with reference to the application of Dr. Selders, did you intentionally delay in any way bringing the matter before the board of the George Washington University Hospital? A.—I don't think it was delayed at all. It went through the usual routine, like other applications.

Q.—Did you at the time know that Dr. Raymond E. Selders was connected with Group Health Association? A.—Oh, yes; I knew that.

Q.—How did you know it? A.—By reading the newspapers.

Q.—Was there a good deal about it in the newspapers at the time? A.—As far as I could see, it was all over the papers, including the front page.

Q.—Did the fact that you knew that Dr. Raymond E. Selders was connected with Group Health Association have anything whatsoever to do with you in your conduct of dealing with the application of Selders in your committee, either after it was received or after it was returned to you from the Academy of Surgery? A.—Had nothing whatsoever to do with it.

Q.—Was the recommendation of the Academy adverse or favorable? A.—Adverse.

Q.—What did the Board do then, upon the recommendation of the Academy of Surgery? A.—His application was turned in to the Dean who presided at the staff meeting, with the notation that the Academy did not approve of his application. It was then put to a vote, submitted to the open staff meeting, and the staff voted not to give him the privileges.

Q.—Were you present at that meeting, Doctor? A.—Yes, sir.

Q.—Was anything said as the basis for rejecting the application of Dr. Raymond E. Selders—that it should be so rejected because he was a member of G. H. A.? A.—No, sir.

Q.—What influence, if any, did his membership on the G. H. A. staff have on the vote of the Board? A.—Nothing, so far as I know. The committee, you mean?

Q.—Yes. A.—Nothing whatsoever.

Q.—Upon what was the vote of the staff based, to your knowledge? A.—It was based solely, I believe, on his professional qualifications.

Q.—Outside of the report which you received from the Academy of Surgery, did your own committee on investigations make any independent investigation into the qualifications of Dr. Selders? A.—No, sir.

Q.—Doctor, do you recall whether at the same time you voted on the qualifications of Dr. Selders you voted on the qualifications of other doctors? A.—Yes, sir.

Q.—Were some of the other doctors rejected also? A.—Yes, sir.

Q.—Was there anything which was done with reference to the application of Dr. Selders which differed from that which was done with reference to the application of any other doctor who was seeking surgical privileges in George Washington University Hospital? A.—In no way whatsoever.

Q.—Will you kindly explain to the jury what an application for general surgical privileges in a hospital means? A.—It means the privilege of operating on any one you might send there as a patient, and do any operation that you think the patient requires, without any supervision of any sort. In other words, you are allowed to have complete charge of the patient and do a major operation, open the abdomen, or anything you want. It is the highest privilege that you can give a doctor, I think, to do general surgery, without any limitations. That is what it means. And we scrutinized these applications pretty closely, because we think a hospital is more or less responsible for the work that is being done, and for that reason we feel that a man who can do any sort of an operation without supervision should be a first class surgeon.

Q.—What would you say with reference to his experience? A.—We feel that he cannot be good unless he has had a large amount of experience.

Q.—You said in the course of your answer, Doctor, that one who received a general surgical privilege could operate without supervision. What do you mean by "without supervision"? A.—Sometimes a man is allowed to operate while some older man stands by, and we say he is allowed to have certain privileges under supervision, to encourage younger men to get proper experience. Without supervision, we mean that a man may go into the hospital and do as he pleases with the patient if the patient permits him to do it.

Q.—Does a resident have the right to operate without supervision in a hospital? A.—Only in the case of extreme emergency, where he could not get a member of the staff.

Q.—Otherwise, what is the practice? A.—He is merely an assistant or sometimes operates under the supervision of the attending surgeon.

Q.—Are you a member of the District Medical Society, Doctor? A.—Yes.

Q.—And of the American Medical Association? A.—Yes, sir.

Q.—What office, if any, do you hold in the District Medical Society? A.—At the present time I am on some committee that has to do with compensation claims and adjustments, or anything of that sort.

Q.—Any other committees? A.—No, sir.

Q.—Do you hold any office in the Academy of Surgery? A.—No, sir.

Q.—Have you ever held office in the Academy of Surgery? A.—I have been president of it.

Q.—When were you president? A.—I think, the first year it was organized, about 1930, I suppose.

Q.—Did you ever hold any office in the District of Columbia Medical Society? A.—Yes. I have been president of that.

Q.—When were you president of the District of Columbia Medical Society? A.—I think, in 1927.

CROSS EXAMINATION.

By Mr. Lewin:

Q.—Dr. White, did you know about the correspondence which Dr. Cutter had had with Dr. Bloedern in the fall of 1937? A.—No, sir.

Q.—Did you know about any efforts on Dr. Cutter's part to have your staff confined to members of the A. M. A. and the local societies? A.—I saw no correspondence and I don't remember having any conversation regarding it.

Q.—There is some correspondence of that character in evidence. I wondered if it would refresh your recollection at all. I think I correctly characterize it when I say that Dr. Bloedern advised Dr. Cutter that the number had been reduced to about three members of your staff, and that number would be reduced later. Does that refresh your recollection at all? A.—No; I don't remember ever having any conversation with Dr. Bloedern along that line, nor was anything done about it, so far as I know.

Q.—If that rule had been in force then, Dr. Selders could not have joined your staff so long as you adhered to the rule?

Mr. Leahy:—I object as argumentative.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—You say your medical staff finally voted on the application? A.—Yes, sir.

Q.—Is it not true that the medical staff included Dr. John Reed? A.—Yes.

Q.—Was he not a member at that time of the Executive Committee of the District Medical Society? A.—I could not say; I don't know.

Q.—Did not your medical staff include at that time Dr. Jacob Kotz? A.—I think so.

Q.—Was he not at that time the vice president of the District of Columbia Medical Society? A.—I couldn't say that. I don't know his affiliations.

Q.—Did it include Dr. Daniel Borden? A.—Yes.

Q.—Was he not at that time a member of the Executive Committee of the Medical Society? A.—I couldn't say. He may have been.

Q.—Did it include Dr. Mallory? A.—Yes, sir.

Q.—Was he not at that time a member of the Executive Committee, and was he not shortly thereafter the president of the District of Columbia Medical Society? A.—He was president at one time. I don't know whether it was that particular time or not.

Q.—Was he not president in the latter half of 1938? A.—Possibly; I don't know.

Q.—At the time at which Dr. Selders' application came up before you the second time? A.—If it was in 1938, he must have been.

Q.—Was not Dr. Arch L. Riddick a member of your medical staff? A.—Yes.

Q.—Was he not also a prominent member of the District of Columbia Medical Society and active on its committees? A.—He was a member of the Medical Society, but I don't know how active and prominent he was.

Q.—Was not Dr. Warren W. Sager a member of your medical staff? A.—Yes.

Q.—Was he not also a member of the Hospital Committee of the District of Columbia Medical Society in the fall of 1937 and the early part of 1938? A.—I couldn't answer as to his activities in the Medical Society; I don't know.

Q.—Did you not know that the Medical Society had a hospital committee? A.—Well, it may have had. I do not take a very active part in the meetings, so I am not familiar with the officers or their activities.

Q.—Did you know about Dr. Sager's answers to a questionnaire which was sent in by Dr. Warfield? A.—No, sir.

Q.—Did you not ever hear of such a questionnaire being sent? A.—If I did, it didn't impress me, because I have no recollection of a questionnaire now.

Q.—Did you not know that Dr. Sager advised the Hospital Committee that your hospital was in sympathy with the policies of the District of Columbia Medical Society in relation to Group Health Association? A.—The committee of which I am chairman?

Q.—No. This Hospital Committee of the District Medical Society. A.—No; I didn't know that.

Q.—Did you not know that there was a hospital committee headed by Dr. Warfield at that time? A.—I knew there was a committee on which Dr. Warfield was active, but I didn't take any active part in it. I don't think I attended more than one meeting during all that period, and I am not familiar with who the officers were or their activities.

Q.—Which one did you attend? A.—Just one regular meeting—I don't know which one that was—in the course of the year.

Q.—Which year—1937 or 1938? A.—I don't remember which year; but I went around once and I don't believe I went again the whole year.

Q.—Of course when the medical staff of your hospital voted on Dr. Selders you did not know what information they had then? A.—What is that?

Q.—When the medical staff of your hospital voted on Dr. Selders' application you did not know what information the rest of the staff had when it voted? A.—No, of course not.

Q.—Did you mean to testify here that you voted against him personally because of the reports you got from the Washington Academy of Surgery? A.—No; I didn't say that. I said if this information was furnished them from the report of the Academy of Surgery what those men thought or felt I don't know.

Q.—When you said you voted to turn him down, you meant that you personally voted to turn him down on the basis of that report? A.—No; I didn't say I voted to turn him down. I said the staff did.

Q.—Did you not vote to turn him down? A.—I may have voted myself, but I didn't say I did.

Q.—You were asked what influenced the staff, whether it was influenced by this report or not. A.—How should I know what influenced the staff?

Q.—You know what influenced you. A.—You mean, do I know why I voted?

Q.—Yes. A.—Yes.

Q.—You voted because of the report from the Washington Academy of Surgery; is not that right? A.—Yes.

Q.—Is this a copy of Dr. Selders' application which you received (handing a paper to the witness)? Perhaps it is the original, Doctor? A.—I assume it is.

Q.—Did not that disclose to you that he graduated in medicine at the University of Oklahoma in June of 1927? A.—Yes.

Q.—And that would be ten years, would it not, before this application was made? A.—Yes, sir.

Q.—It disclosed to you, did it not, that he had received a Bachelor of Arts degree, that he had received a Bachelor of Science degree in Chemical Engineering, that he had received a Bachelor of Science degree in Medicine, and a number of other degrees? Maybe you are more familiar with them than I am. A.—Yes.

Q.—Do you know anything about the University of Oklahoma's standing as a medical school. A.—No. I think it is all right now, at the present time. I don't know what it was then.

Q.—You do not have any reason to believe it was not good then, do you? A.—No.

Q.—Did it not disclose also that he had had an internship back in 1927 and 1928 at St. Joseph's Infirmary at Houston, Texas? A.—Yes.

Q.—Did you know anything adverse to that institution? A.—No.

Q.—You would suppose that would be good intern training? A.—That would depend upon the institution.

Q.—Have you any reason to believe—A.—I know nothing about it; I couldn't say whether it was good or bad.

Q.—Did you make any inquiries to find out? A.—No, sir.

Q.—And yet this was on the application that was referred to you to pass on? A.—Yes.

Q.—You found out also that he was a resident in surgery at the Worcester City Hospital in Massachusetts, did you not? A.—Yes.

Q.—Did not that tell you that he was there in 1936 to 1937? A.—Yes, sir.

Q.—And that was seven or eight years after he had had his internship? A.—Yes, sir.

Q.—What do you say about the standing of the Worcester City, Massachusetts, Hospital? A.—I know nothing about it.

Q.—You know nothing against it? A.—No, sir.

Q.—Did you investigate to find out whether it was a good place for a resident to be trained? A.—No, sir.

Q.—Of course you wanted this information, I suppose, for the purpose of investigating him, did you not? A.—That information was used for that purpose.

Q.—But not by you? A.—No.

Q.—Or by your medical staff? A.—By an agency which the medical staff had approved.

Q.—You mean, the Washington Academy of Surgery? A.—Yes.

Q.—But it was not used by you or your medical staff or your credentials committee, was it? A.—No; it was used by the staff of the Academy of Surgery on a definite motion and act of the Society.

Q.—Were you there when that was done? A.—Yes.

Q.—Were you a member of the Credentials Committee of the Washington Academy of Surgery? A.—No, sir.

Q.—Did you attend its deliberations? A.—No, sir.

Q.—Did you take any part in the investigation that it conducted? A.—No, sir.

Q.—As a matter of fact, did they not simply delegate it to Dr. Fred Sanderson to investigate? A.—I couldn't tell you what the action was.

Q.—As a matter of fact, was not Dr. Fred R. Sanderson the vice president of the Committee on Compensation, Contract and Industrial Medicine? A.—I don't know.

Q.—As a matter of fact, did not Dr. Sanderson prefer these charges against Dr. Tribble in May of 1938?

Mr. Leahy:—I object, as immaterial. He said he did not even know that it was referred to Dr. Sanderson.

THE COURT:—That is a matter of argument to the jury later.

Mr. Lewin:—All right, your Honor.

By Mr. Lewin:

Q.—You saw that he had been admitted to practice under the laws of the District of Columbia, did you not, from his application? A.—Yes, sir.

Q.—You saw that he had had graduate work? A.—Yes.

Q.—And had received a graduate degree? A.—Yes, sir.

Q.—Do you know where he received that? A.—Pennsylvania.

Q.—The graduate school of medicine in Pennsylvania. What would you say about the standing of that institution? A.—Very good.

Q.—So you would suppose, at any rate, that a post graduate of that institution would have some qualifications, would you not? A.—Yes.

Q.—For some kind of surgery, at least; is that right? A.—For some kind of surgery; yes.

Q.—He had applied for general surgery, had he not? A.—Yes.

Q.—You would construe that to mean all types of surgery, would you not? A.—Yes, sir. General surgery includes all types, unless some special type is indicated or requested.

Q.—It would include minor surgery too? A.—Yes.

Q.—Nevertheless, you turned down his application? A.—We don't discriminate. He asked for general surgery and he was turned down in general surgery. He didn't ask for minor surgery.

Q.—It was included in general surgery, was it not? A.—That is a different classification. A general surgeon can do minor surgery, but a minor surgeon cannot do general surgery.

Q.—You say you never met this man? A.—No, sir.

Q.—You did not know what manner of man he was? A.—No.

Q.—Although this was sent to you for investigation? A.—Yes.

Q.—You also saw, did you not, that he was a member of the Harris County Medical Society and a member of the American Medical Association? A.—Yes.

Q.—He was not a member of any of the local societies here? A.—I don't know. He doesn't state there whether he was or not.

Q.—You had heard something about this controversy with Group Health Association, had you not, Doctor? A.—I had read a good deal about it. I had not heard much.

Q.—Did you not know that he was not a member of the District of Columbia Medical Society? A.—I presume I did.

Q.—Did you not know he did not have a chance to get into it? A.—No; I didn't know that. I didn't know that he had made application.

Q.—Did you not know what would happen to him if he had? A.—I had no way of knowing that.

Mr. Leahy:—I object.

THE COURT:—That is not proper.

Mr. Lewin:—I just simply want the answer, your Honor. I will not press it.

By Mr. Lewin:

Q.—Do you see from this application also that he had had teaching experience at the University of Oklahoma? A.—I presume I saw everything on there. If that is on there, I saw it.

Q.—That he had had operative surgery? A.—Yes.

Q.—Why did you bother to read this at all if you were not going to do anything about it?

Mr. Leahy:—I object.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—You saw that he had staff appointments at various hospitals, the Memorial Hospital in Houston, Texas, and St. Joseph's Infirmary? A.—Yes.

Q.—You saw about his contributions to medical literature? A.—Yes, sir.

Q.—I wonder if you would read those for me. They are hard for me to pronounce. A.—Maybe I can't pronounce them either. The first is Seminar on Rectosigmoid Carcinoma.

Q.—What is that? A.—A story or dissertation or comment on cancer of the rectum. The next one is A Comparison of Gastropylorctomy and Pyloric Resection in Treatment of Pyloric Ulcer.

Q.—Would you say those were fairly difficult surgical subjects? A.—I don't think what a man writes about it indicates his ability in any way in surgery. It is a deep subject.

Q.—You also saw that he gave some references to you? A.—Yes.

Q.—He gave you Dr. Walter E. Lee, Professor of Surgery at the Graduate School of Medicine, Pennsylvania? Did you write to Dr. Lee? A.—No, sir.

Q.—He was Professor of Medicine at the University of Pennsylvania? A.—Yes.

Q.—He gave you Dr. Leonard Brown as a reference, who is Professor of Surgery at Temple University? A.—Yes, sir.

Q.—What is the standing of that university? A.—Very good.

Q.—Would a Professor of Surgery at the University of Pennsylvania be a responsible reference? A.—I would think it would be a very good reference.

Q.—Do you think a Professor of Surgery at Temple University would be a good reference? A.—Almost as good.

Q.—Then he gave Dr. John T. Moore, Past President of the State Medical Association of Houston, Texas, and Dr. George McIvor, Superintendent of the Worcester, Massachusetts, Hospital. A.—Yes, sir.

Q.—And you did not write to any of them? A.—No, sir; to none of them.

Q.—He made his application and told you that he agreed to abide by the rules of the staff and such rules or regulations as might be enacted, did he not? A.—Yes, sir.

Q.—Also, did not Mr. Penniman's letter to the George Washington University Hospital tell you that he would be happy to be useful to the hospital in any way in which his services could be used? A.—I don't remember the details of his letter. There was a letter from Mr. Penniman, I think.

Q.—Was it not to that effect? A.—I couldn't say, without reading it again.

Q.—Well, I will not bother to get it out now. You simply took this and passed it over to the Washington Academy of Surgery. You did that orally, did you not? A.—I couldn't pass it over orally. I sent it to them. I think I did. I sent it to the secretary. I am not sure about that, but I conveyed the information to them.

Q.—And then were you present when the Washington Academy of Surgery decided what to take into consideration? A.—You mean, at a committee meeting?

Q.—I think this was a regular meeting held at the Cosmos Club, Dec. 10, 1937. A.—I don't think so. I don't recall.

Q.—I am showing you a photostatic copy of the minutes signed by Dr. Fishback. Was he the secretary? A.—He was at one time. I don't know whether he was then or not.

Q.—Did you know that the Washington Academy of Surgery took Dr. Selders' employment into consideration? A.—No; I don't know what action it took at all. I was not a member of the committee which passed on his application.

Q.—Did you not know that the Washington Academy of Surgery was made up largely of members of the defendant District of Columbia Medical Society? A.—Yes; of course most of them are members of the District of Columbia Medical Society.

Q.—Were they not all? A.—I couldn't say. Most of them were, I am sure.

Q.—So far as you know they were all members, were they not? A.—So far as I know they were—I assume they were.

Q.—Did you not know that the District Medical Society had taken the position that Dr. Selders' connection with Group Health Association was unethical?

Mr. Leahy:—I object. There is no such evidence.

Mr. Lewin:—There are oceans of evidence.

Mr. Leahy:—There is no such evidence in the case.

THE COURT:—The American Medical Association?

Mr. Lewin:—The District of Columbia Medical Society. Oh, my goodness! Think of all those minutes we read here!

Mr. Leahy:—You can say, "Oh, my goodness"! all over the place, but it is not there, and you cannot put it in there by that exclamation.

Mr. Lewin:—I think his Honor remembers it.

THE COURT:—You may ask him what action the Medical Society took about it.

By Mr. Lewin:

Q.—Do you know what action the District Medical Society took regarding the branding as unethical of the connection of a doctor with Group Health Association? A.—No, sir.

Q.—You knew about this hospital committee, the report of Dr. Warfield on December 1, did you not? A.—No, sir; I did not.

Q.—Did you not know the substance of it? A.—No, sir.

Q.—Do you think your memory might be refreshed on that point? Do you know whether or not your hospital ever went back to Dr. Selders and told him that he was asking for too much and that he ought to ask for something less, and the hospital would be glad to have him? A.—No; I have no recollection of any correspondence with Dr. Selders. I had none, I am sure.

Q.—Do you know whether or not there was any suggestion to that effect by the Medical Society? A.—I have no recollection of it. If any correspondence took place it was through Dr. Bloedorn's office, perhaps, and not through me. The purport of it I do not know.

Q.—Would you say that if this record of his is true he might have qualified to do some kind of surgery? A.—I think if he had asked for minor surgery he might have gotten it.

Q.—But you do not think you made any suggestion to that effect? A.—Well, it is not customary to do that. I know I did not make any suggestion to that effect.

Q.—Did you or your hospital make any suggestion to him that he might come to your hospital and be put under wraps, so to speak, and be observed by some of your more skilled men? A.—What do you mean by "put under wraps"? I don't understand that.

Q.—That was an expression that was used before. I do not think I understand it very fully—but put under supervision by somebody.

Mr. Leahy:—How do you spell it?

A.—It didn't come from me. It may have come from some other officer of the Society, but not from me.

By Mr. Lewin:

Q.—Would you think that would be a fair thing to do? A.—It seems to me that if I were turned down I would come around to find out why. It is not up to the hospital to suggest how to get in, any more than trying to get into a club. I don't think a club tells a man how to get in.

Q.—You think a private hospital in the city of Washington is just like a club? A.—No; I didn't say that. I said that getting in may be like a club.

Q.—You say, it is like getting into a club? A.—I said it may be. Certain qualifications are necessary, I would say.

Q.—You had that in mind when you took this action, didn't you? A.—That he didn't qualify?

Q.—No; that it was something like getting into a club. A.—No; he didn't qualify to get into a club.

Q.—Dr. White, is it not true that your hospital did not let any other Group Health doctors in during that year? A.—I don't know whether any others applied or not.

Q.—Did not Dr. Halstead apply? A.—It wasn't brought to my attention.

Q.—Did you not know that he applied to your hospital in 1938, in August, for minor surgery? A.—I didn't know of that. It didn't come to my attention. Dr. Halstead?

Q.—Yes. A.—I don't recall that he did.

Q.—Did you not know that in the fall of 1938 Group Health Association did come back to the hospital to re-apply? A.—I have heard something about that.

Q.—Is it not true that you simply referred it again to the Washington Academy of Surgery? A.—If it was for major surgery it would be referred to them, but not for minor surgery. Minor surgery comes under medicine. Therefore I would not get an application for minor surgery.

Q.—You gave it the same treatment you gave it before? A.—I didn't give it any treatment.

THE COURT:—You misunderstood him. He said an application for minor surgery would come under the medicine end of it, and he would not get it.

Mr. Lewin:—I see.

By Mr. Lewin:

Q.—As a matter of fact, did he not apply again for courtesy staff privileges at the George Washington Hospital through Group Health Association? A.—Who applied?

Q.—Dr. Selders? A.—Not that I know of. I don't remember.

Q.—I wonder if I can refresh you from my notes. If you have any doubt about it, tell me so. I have here the minutes of the staff conference of Oct. 10, 1938, of the George Washington University Hospital at which Dr. Bloedorn was present,

and you were present, among others, and it says that Dr. Selders' case was referred back to the Committee on Hospital Privileges for recommendation. Were you still on the committee? A.—Yes, sir.

Q.—And it was moved and seconded that Dr. Selders' application be referred to the Academy of Surgery and the recommendation followed the usual procedure? A.—Yes, sir.

Q.—Is not that the last action that you took in that matter? A.—That is the last that I recall.

Q.—Did you know Dr. Glenn I. Jones, Dr. White? A.—Yes, sir.

Q.—Do you remember his coming to see you with regard to a proposed connection with Group Health? A.—I think he came in to see me once.

Q.—Was not that in April of 1937, or March? A.—I couldn't recall the year or month.

Q.—Is it not true that you discouraged him from joining? A.—I don't know whether I discouraged him. I probably expressed an opinion, and he could use it as discouragement or encouragement, as he felt about it.

Q.—Did you not tell him, in substance, that any member of the medical profession of the District of Columbia who joined Group Health Association would be kicked out of the District Medical Society or lose his membership therein, and any member of the Medical Society of the District of Columbia who consulted with a member of the Group Health would likewise be put out of the District Medical Society? A.—I would say I never told him that, because I would have no way of knowing it. I may have said it was my opinion that something like that might happen, but I couldn't tell him it would happen.

Q.—You held that belief, did you not? A.—If I said that I held that belief.

Q.—Didn't you hold that belief? A.—I don't remember. I may have.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—Did you know of any reason at all why you should throw the bars down and the rules and regulations of George Washington University Hospital simply because Dr. Selders made an application?

Mr. Lewin:—Objected to as argumentative and not proper redirect.

THE COURT:—The question is whether they took the regular course; that is all.

By Mr. Leahy:

Q.—Was there anything done, Doctor, with reference to this application other than was done as to the applications of the other doctors that you said were rejected at the same time Dr. Selders was? A.—His application took the regular order of business that every other application had for two or three years prior and ever since, so far as I know. There has been no exception in any way whatsoever.

Q.—Since the time that your board voted that the Washington Academy of Surgery should make investigations into the qualifications of every applicant for general surgery privileges at George Washington University Hospital, have you ever investigated personally an application? A.—I never have. I always felt that the Academy was in a position to do it much better than I could alone.

Q.—Have you ever written to anybody whose name was given as a reference on any application? A.—Never.

Q.—Have you always referred the references, as well as the qualifications, to the Academy of Surgery? A.—I have sent the applications as they appeared to the Academy of Surgery.

Q.—Going over the application, Doctor, is there anything different about this application as it is written by Raymond E. Selders than an application written by anybody else, save and except that the answers would be different as to medical schools, and so forth?

Mr. Lewin:—Objected to. There is no question left—"Is there anything different except that it is different"? A.—It is a regular form which everybody fills out.

THE COURT:—I think the question should be simply whether or not that is the regular form of application.

By Mr. Leahy:

Q.—Is that the regular form that everybody signs? A.—These are printed by the thousand, and everybody gets one who makes application, exactly the same.

Q.—How many such applications do you think come to George Washington University Hospital in a year? A.—I suppose about one hundred and fifty to two hundred, possibly, for surgery alone.

Q.—When courtesy privileges are granted in George Washington University Hospital, how long are they granted for?
A.—For a year.

Q.—And at the expiration of the year must the applicant then fill out this same kind of an application? *A.*—No, unless for some reason he is not approved. Then they may go back to him for a new application. He may have changed his qualifications; he may have improved his qualifications. Then he can make a new application.

Q.—Do you recall how many other applications you sent along to the Washington Academy of Surgery at the time you sent this Selders application? *A.*—No; but I send in, in the course of a year, I should say, twenty or thirty, or possibly more.

Q.—Were those whose applications were rejected at the same meeting of the staff at which Selders' application was rejected members of the society? *A.*—Has it been testified that there were others rejected at the same time?

Q.—Yes.

THE COURT:—I did not catch the question. Put it again.

By Mr. Leahy:

Q.—Were other names, or the names of others who made applications, other than Dr. Selders, rejected at the same meeting in which the Selders rejection took place? *A.*—Applications to the George Washington University Hospital, which had been referred to the Washington Academy of Surgery, and which the Washington Academy of Surgery referred back to George Washington University Hospital with its recommendation pro or con.

By Mr. Leahy:

Q.—Were there other such applications than that of Selders which were rejected at the same meeting that Selders was rejected? *A.*—I cannot be sure it was the same meeting, but certainly many other applications were rejected at the regular meetings. Whether there was more than Dr. Selders' at that meeting I don't know, unless I could see the minutes. It was nothing unusual to reject a man making application for surgery.

Q.—Doctor, does the fact that an applicant for privileges in your hospital happened to be a member of one society or another society or no society control in the question of the granting or refusal of an application?

Mr. Lewin:—Objected to, as leading, argumentative, and calling for a conclusion.

THE COURT:—Objection overruled.

A.—The question of membership in the Society has never come up in the consideration of an application, so far as I know.

By Mr. Leahy:

Q.—Did the fact that Dr. Selders was or was not a member of the District Medical Society have anything to do with the rejection by your board of his application?

Mr. Lewin:—Objected to. He has already testified that he did not know what was in the minds of the board.

By Mr. Leahy:

Q.—So far as you know.

Mr. Lewin:—He does not know. He said he did not.

THE COURT:—He may state whether or not that was the subject of any discussion in the meeting.

The Witness:—The matter of membership in any organization was not discussed. I think the men had in mind his professional qualifications when they voted on it. That is my private opinion.

Mr. Lewin:—We move to strike the private opinion.

THE COURT:—That will go out.

By Mr. Leahy:

Q.—Do you recall whether there was any discussion in the board whatsoever as to the fact of his membership in the Harris County Medical Society or the Medical Society of the District of Columbia? *A.*—In the board?

Q.—When his application came up for final vote. *A.*—Before the staff?

Q.—Yes; the staff. *A.*—The membership in no society was discussed at that time.

Q.—What was the only subject discussed, to your recollection, by the staff at the time that the application came up for rejection or acceptance? *A.*—I think I made the statement that this was to be acted upon purely on a professional qualification basis. I think I made that statement before the staff.

Q.—What was the reason why you made that statement before the staff in reference to that application?

Mr. Lewin:—Objected to.

THE COURT:—Objection overruled.

A.—There had been lots of publicity about this thing, and I felt he ought to have a fair deal, a square deal, and I wanted

to make it plain to the staff that it was purely on his professional qualifications; and I think I made that statement. What the reaction was I don't know.

By Mr. Leahy:

Q.—Doctor, you were asked also some questions about a questionnaire of Dr. Warfield's. Did you ever see a questionnaire which Dr. Warfield had sent? *A.*—If I ever saw it I don't remember it, and I certainly must have thrown it in the wastebasket for it made no impression on me whatever.

Q.—Did any questionnaire of Dr. Warfield ever come before the staff of George Washington University Hospital for action? *A.*—Not that I recall.

Q.—Do you have now any recollection of ever acting on any questionnaire that was presented? *A.*—No, sir; I have no recollection whatsoever of any.

Q.—Did the staff of George Washington University Hospital ever take any official action with reference to supplying the District Medical Society with any information in regard to any questionnaire? *A.*—Not during any of my attendance in the meetings; and I attended practically all of them.

Q.—You were asked about the Mundt Resolution, Doctor. Do you know what that is? *A.*—I have heard of it recently, but up to that time I had not heard much about it.

Q.—Do you recall whether any action was even taken by the staff of George Washington University Hospital with reference to the Mundt Resolution on the suggestion of Dr. Cutter? *A.*—No, sir; not at any meeting I have attended.

Q.—Did any such thing as that ever come before the staff for discussion? *A.*—No, sir.

Q.—Did you ever hear about it before you were asked about it this morning? *A.*—I heard about it a few weeks ago, but never before.

Q.—Was that since this trial started? *A.*—Yes, sir.

Q.—Did the staff of George Washington University Hospital ever take any action as to whether the Mundt Resolution should be enforced in George Washington University Hospital? *A.*—I never heard of the Mundt Resolution, so far as I know.

Q.—Did you ever hear any motion put to the effect that only members of the District of Columbia Medical Society should be members of the staff of George Washington University Hospital? *A.*—It never came up.

Q.—As a matter of fact, are there members who are not members of the District of Columbia Medical Society on the staff? *A.*—Plenty of them.

Q.—How many, would you say? *A.*—Twenty or thirty.

Q.—Have there been for the last three or four or five years? *A.*—Longer than that.

Q.—In other words, has the application of any member for staff privileges in George Washington University Hospital any relation at all to his membership in any organization? *A.*—I don't believe it has a thing to do with it.

Q.—With reference to G. H. A., do you recall whether the staff of George Washington University Hospital ever took any position with reference to G. H. A. and the District of Columbia Medical Society or the American Medical Association? *A.*—I don't think it took any action whatsoever. I never heard it discussed in the Society. It was purely Society affairs, and nothing else.

Q.—When you voted upon the application of Dr. Raymond E. Selders did you vote for his rejection to try to restrain or to break up G. H. A.? *A.*—Certainly not.

Q.—Did you in any way vote in order to interfere with G. H. A.?

Mr. Lewin:—Objected to as leading.

Mr. Leahy:—It has got to be leading.

Mr. Lewin:—Can he not state why it was he voted?

Mr. Kelleher:—This man is not a defendant, your Honor.

THE COURT:—I think this is getting beyond the scope of the examination.

Mr. Leahy:—I made a note that they asked him something about G. H. A. and what he knew about it.

Mr. Kelleher:—You are not asking him that.

Mr. Leahy:—I know what I am asking.

Mr. Lewin:—So do we.

THE COURT:—You may ask him whether he had any bias against G. H. A.

By Mr. Leahy:

Q.—Did you, Doctor? *A.*—I voted to reject him purely on the report of the committee of the Academy of Surgery in which I had the utmost confidence, that they would give him a proper examination or investigation, and for nothing else. I did not know Dr. Selders. I had never seen him. I would reject any man that the Academy would not approve—my own son.

RE-CROSS EXAMINATION

By Mr. Lewin:

Q.—Is it not true, Doctor, that all of the surgeons on your medical staff, speaking of George Washington University Hospital, were also members of the Washington Academy of Surgery? A.—I could not say. They probably are.

Q.—When you delegate that task to the Washington Academy of Surgery you are really delegating it to the same group of men, are you not? A.—There are other men in the Academy of Surgery than are on that committee, who were members of the George Washington University Hospital staff. They may not even be members of that committee; I don't know.

Q.—Why is it that the Washington Academy of Surgery is better qualified to investigate Dr. Selders than you were, and your staff? A.—I think I can answer that for you. A committee of about ten men in the Academy of Surgery have affiliations with all the hospitals in Washington, and I believe that a committee of ten could investigate a man better than a committee of one, which would be me.

Q.—Could you not have a committee of ten? A.—Yes; but the committee was already set up, acting for all the hospitals in Washington. We were trying to get a standard board of examination at the time.

Q.—You had a Credentials committee? A.—Yes.

Q.—And you had a large medical staff composed of competent surgeons? A.—Yes.

Q.—Could you not have had ten men investigate Dr. Selders, if ten men were necessary?

Mr. Leahy:—I object to that, as argumentative.

THE COURT:—Objection sustained. It is purely argumentative. He said that the application was referred to the committee under the method that they had adopted as to every application. Of course he might have done it otherwise.

By Mr. Lewin:

Q.—You remember that the report from the Washington Academy of Surgery simply said that the committee—

Mr. Leahy:—I object to the reading of the document.

Mr. Lewin:—I am not reading from the document. As a matter of fact, this is not the document that I want to show him. I am trying to save time.

THE COURT:—I think this witness has been pretty thoroughly examined by both sides.

Mr. Lewin:—There are a few points that I do not think have been brought out, your Honor, and I would like to bring this one out.

By Mr. Lewin:

Q.—Is it not true that the report of the Washington Academy of Surgery which your hospital received confined its remarks on Dr. Selders to saying that "the committee is attempting to obtain further information on Dr. Raymond E. Selders and has not yet been able to act on his application." Was not that the first one? A.—I don't know whether it was or not. That didn't come to me directly. I think that went to the Dean, probably.

Q.—Did you not ever see the report which the Washington Academy of Surgery made on Dr. Selders? A.—I probably saw the last and final report.

Q.—Did not that simply say that he was disapproved, without stating the reasons? A.—It may have.

Q.—As a matter of fact, is not that all that the Washington Academy of Surgery reported, that he was simply disapproved? A.—That is sufficient for our purposes.

Q.—But you did not know on what ground they had turned him down? A.—No.

Q.—Or what investigation they had made? A.—No; I did not.

Q.—Why are you so confident that the Washington Academy of Surgery could have investigated him better than you could? A.—Because I have complete confidence in that group, and the hospital staff voted to accept their recommendation. That was the regular action of the staff.

Q.—You had confidence in your own group, did you not? A.—The staff took action. Why should I do differently as a member of the staff?

Q.—The point is that you and your committee and the hospital itself knew nothing against Dr. Selders except that the Washington Academy of Surgery had turned him down for undisclosed reasons; is that right? A.—Surely.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—See if this does not refresh your recollection so that you can state now, as a matter of fact, that other people were rejected besides members of G. H. A. at the same meeting.

Mr. Lewin:—That was not at the same meeting. That was another meeting.

Mr. Leahy:—It was the same meeting in which one of your men was rejected.

Mr. Kelleher:—They did not disapprove Selders at that time.

Mr. Leahy:—I know it.

THE COURT:—Let us not have this kind of argument between counsel.

The Witness:—They refused two men for privileges, in the same letter.

By Mr. Leahy:

Q.—One was Dr. Allen E. Lee? A.—Yes.

Q.—What did he make application for? A.—General surgery.

Q.—And he was disapproved as to general surgery, was he not? A.—Yes.

Q.—And without mentioning the name of the other doctor, as a matter of fact there is a disapproval of one whom we will call Dr. Blank to do surgery also; is that right? A.—Yes.

Q.—Do you know whether or not Dr. Blank was a member of the District Medical Society? A.—I think he was.

Q.—Did you disapprove him? A.—Because we did not think he was qualified to do general surgery.

RE-CROSS EXAMINATION

By Mr. Lewin:

Q.—When you got this report on Dr. Lee it did not state the grounds for his disapproval? A.—No, sir.

Q.—And at that time he was also a member of the staff of Group Health Association? A.—I don't know.

Q.—Is it not dated? A.—I don't know the date that he was a member of it.

Q.—Is not that the date (indicating)? A.—I still don't know.

Q.—Don't you know about the Lee and Scandiffio matter? A.—I knew he resigned.

Q.—Did you not know that he was tried for unethical practices?

Mr. Leahy:—I object.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—This date is Dec. 8, 1937? A.—Yes.

THE COURT:—Gentlemen, this examination has got to end some time. I think it has gone far enough.

Mr. Leahy:—It has for me. I have no further questions.

Mr. Lewin:—I have no further questions, your Honor.

Mr. Leahy:—May Dr. White be excused?

THE COURT:—Yes.

TESTIMONY OF HENRY C. MACATEE

DIRECT EXAMINATION

By Mr. Leahy:

Henry C. Macatee, 2324 California Street, Washington, D. C., said he had resided in the District of Columbia since 1895. He has been a member of the Medical Society of the District of Columbia since 1902. He has been a practicing physician in Washington since 1901. He graduated from George Washington University in 1900. Following graduation he was an intern at Garfield Hospital from 1900 to 1901, and in 1903 and 1904 was Superintendent of the George Washington University Hospital. He is now connected with Garfield Hospital as a member of the Society of Incorporators, a member of the board of directors, a member of the executive committee of the board of directors, president of the medical staff, and ex officio chairman of the advisory committee. On the board of directors there are about eighteen or twenty laymen except for himself, Dr. Reichelderfer and Dr. Lindsay. The witness had abandoned general practice for the specialty of internal medicine about 1918.

Q.—Doctor, when was it, if you can recall now, that your attention was first attracted to G. H. A.? A.—About the middle of May 1937.

Q.—How was that brought to your attention at the time? A.—I was invited to attend a meeting at the office of Dr. William Gerry Morgan.

Q.—From whom did the invitation come? A.—I think, from Dr. Morgan himself; I am not sure.

Q.—Prior to the receipt of the invitation did you know anything about the meeting to be held at his office? A.—Nothing whatever.

Q.—In what shape did the invitation come to you? A.—By telephone call.

Q.—As a result of receiving the invitation, what did you do? A.—I went to the meeting.

Q.—Who was present at the meeting, Doctor? A.—As nearly as I can remember, Dr. Morgan, Dr. Christie, Dr. Groover,

Colonel Glenn I. Jones and, I think, some medical officer of the Army whose name I do not remember.

Q.—How long did the meeting last, Doctor? A.—I would say, an hour to an hour and a half.

Q.—Do you recall who was the speaker there, in the sense of the person who was giving information, if information was given, with reference to G. H. A.? A.—Colonel Glenn I. Jones.

Q.—Following this meeting with Colonel Glenn I. Jones, when, if at all, was the next meeting or the next occasion when you had any information with reference to G. H. A.? A.—At a meeting of the Executive Committee of the Medical Society on June 1, 1937.

Q.—Were you a member of the Executive Committee of the District of Columbia Medical Society at that time, Doctor? A.—I was.

Q.—When did you take office in the Executive Committee? A.—In 1929, for this term of service. I had served ex officio as the delegate of the District Medical Society to the American Medical Association.

Q.—Are you one of the delegates from your own Medical Society to the House of Delegates? A.—I am the only delegate.

Q.—I meant to ask you, Doctor, if you ever held any other office than on the Executive Committee in the District of Columbia Medical Society? A.—I was recording secretary of the Medical Society from 1905 to 1920. In 1921 I was president of the Society, and thereafter I was a member of the Executive Committee by election and was chairman of the Executive Committee for two or three years.

Q.—During the year 1937 and also the year 1938 down to December 20 of that year, were you on the Executive Committee of the District Medical Society? A.—I was.

Q.—You state that on June 1, 1937 there was a meeting of the Executive Committee of the Medical Society of the District of Columbia? A.—There was.

Q.—Where was that meeting held? A.—At the Medical Society.

Q.—Was there any discussion at that time with reference to G. H. A.? A.—There was.

Q.—Do you recall who was present on that particular occasion, Doctor? A.—It was a well attended meeting of the Executive Committee, the personnel of which I am hazy about now. I know that the secretary of the Society was also secretary of the Executive Committee, and he was Dr. Conklin. I was present. Dr. Verbyckce was present by invitation.

Q.—What position, if any, did Dr. Verbyckce hold in the District of Columbia Medical Society? A.—At that time he was chairman of the Economics Committee.

Q.—Do you recall now whether or not Dr. Verbyckce at any time during the course of that meeting made any report to the Executive Committee with reference to G. H. A.? A.—Yes. He reported that he had obtained a copy of a prospectus in the form of a mimeographed pamphlet describing its purposes and its plan of operation.

Q.—Was there any way of identifying which particular pamphlet he had reference to? A.—The pamphlet itself was presented at that time.

Q.—Do you recall whether or not it was marked with any descriptive word? A.—It was marked "Confidential."

Q.—Did you see the pamphlet at that time, Doctor? A.—I saw it at that time and previously.

Q.—Where had you first seen that pamphlet? A.—Dr. Verbyckce and I have offices jointly, and saw it in our offices.

Q.—At the meeting about the middle of May had you then heard anything further about G. H. A., other than what you received verbally from Colonel Glenn I. Jones? A.—Nothing, until I saw the prospectus in our offices.

Q.—Do you recall how long prior to the June meeting of the Executive Committee it was that you saw this prospectus? A.—I would say, a few days only.

Q.—I want to show you a photostatic copy of what has already been introduced in evidence, and ask you if you can identify that as a copy of the pamphlet which was presented there at that time? A.—I think that is the identical pamphlet.

Q.—Do you recall now whether any action was taken in the meeting of June 1, 1937 by the Executive Committee? *The Witness*:—"June 1, 1937. News of G. H. A., Inc., communicated to Executive Committee. Prospectus presented. Subcommittee, McGovern, chairman, appointed."

Q.—Have you seen what has been offered in evidence here which purports to be a photostatic copy of the minutes of the meeting of the Executive Committee of June 1, 1937? A.—I have.

Q.—In so far as the action taken at that meeting is recorded in those minutes, can you tell us whether or not they correctly

record the ultimate action taken? A.—According to the best of my recollection, they do.

Q.—Have you looked over the statement which the minutes at the time recorded, by way of abstracting the remarks of Dr. Verbyckce, to tell us whether in your judgment Dr. Verbyckce made the statement or in substance that?

Mr. Lewin:—Objected to. We do not want his judgment about it at all, or his opinion.

THE COURT:—I suppose it is to refresh his recollection.

Mr. Leahy:—That is all it is, if your Honor please.

THE COURT:—He may state whether or not that accords with his recollection.

The Witness:—I think my best answer would be that the minutes were subsequently read and approved.

By Mr. Leahy:

Q.—Do you recall what they record with reference to Dr. Verbyckce's opinion which he gave to the committee, as to whether that is or is not what occurred at the time? A.—I think substantially the record indicates what occurred at the time.

Q.—Who was the chairman of the committee at that time?

A.—Dr. Thompson.

Mr. Leahy:

"The Chairman, in addressing the meeting, said that the reason for calling the special meeting was on account of certain serious situations that had developed. The Home Owners Loan Corporation, the Veterans Bureau, the Soil Conservation Department, and the Reconstruction Finance Corporation had already undertaken the development of a plan for medical care of their employees. He had learned that the Home Owners Loan Corporation was attempting to get an appropriation from Congress"—

Mr. Lewin:—Excuse me a moment. May it please the Court, may I make this suggestion with regard to reading from the minutes? May we not both have the right to read pertinent portions of the minutes to the witness in connection with a question, and not read the entire documents over again?

THE COURT:—It is difficult for me, the way things have gone, to put any severe limitations upon references to these papers; but I have indicated to counsel that I would like them to read only those parts which may be pertinent to the examination of a witness.

Mr. Leahy:—That is all I am going to read. There are pages that I will not even think of reading, your Honor.

(After some discussion among the attorneys.)

THE COURT:—What is your particular purpose, Mr. Leahy? I would like to know.

Mr. Leahy:—It was at this special meeting that the G. H. A. matter for the first time came in any official way before the District Medical Society. Certain information was given to the Executive Committee by Dr. Verbyckce and Dr. Thompson. It becomes important to see what the official attitude of the District Medical Society was with reference to G. H. A. from the very first day. The District of Columbia Society has been made a defendant, and there have been read so many statements made in meetings, discussions back and forth, that I want to be able to trace for the jury, if I can, that after these discussions were had, after the chats were had back and forth in committee meetings or on the floor, the action of the District Medical Society as the entity which has been made a defendant in this case was thus and so, so that we will have a clear chronological picture of just how this all developed.

THE COURT:—I think, of course, the minutes should stand in the same position as letters. I have accorded counsel on both sides the privilege of reading letters or such parts thereof as they might deem material in their own case, regardless of who has produced the letters, and that has been rather liberally taken advantage of by both sides. If there are any parts of the minutes which counsel feel are necessary to set forth in their own case, whether it be in the prosecution or the defense, I think it is only fair, in view of the great number of exhibits, to permit it to be done. But I want to request counsel again to, as far as possible, limit such reading to things that they deem really important.

Mr. Leahy:—That was the only purpose, your Honor, to see if I could get a chronological picture of the official acts taken. I think I got down to the point that he had learned that the Home Owner's Loan Corporation was attempting to get an appropriation from Congress.

"He thought it was the duty of every member of the Society to contact their representatives with a view to blocking this effort. The idea was to get sufficient funds to finance a medical service plan. Briefly, the plan, according to his information, was that Dr. H. H. Brown is to be the Medical Director at \$8,000 a year. Mr. Brown is now in the Veterans' Bureau in charge of the Tuberculosis Division. Government employees would pay a certain amount per annum from their income.

The Chairman was under the impression that it would be impossible to get an injunction out against the procedure and that the only hope would be to hold off the adoption of the plan until the Medical Society could work out a substitute plan that would be less vicious. Dr. Thompson called on Dr. J. Russell Verbyrcke Jr., who had been very much interested in this subject.

"Dr. Verbyrcke said that he had heard of this plan and he had in his hand a prospectus, marked 'Confidential,' in which details had been very well worked out. He added that there were certainly some parts of the plan that would seem intriguing. He had written a letter to Dr. W. C. Woodward, which he stated was semiofficial, in which he outlined the situation with a view to getting the opinion of the A. M. A. headquarters. He then proceeded to read rather extensively from the prospectus at hand. This prospectus was to be known as the Group Health Association, Inc. Mr. William F. Penniman of 1869 Wyoming Avenue N.W. is President; Mr. H. T. Berry, 3019 Rittenhouse Street, is Secretary. The Twentieth Century Foundation was beyond a doubt interested in this so-called Filene Association, and would in all probability help finance the project to get it started. It had been estimated that there were some one hundred and nineteen thousand Government employees and that the expected sum to be obtained from these employees would amount to \$1,750,000 per annum. It was contemplated to hire eighty physicians; their salaries would range from \$3,000 to \$12,000 per annum. They would not be allowed to do outside work. Briefly, the plan was to have an employee, whose income was \$1,000 a year, contribute \$40 a year for health service. If a man's income was \$10,000, he would pay \$400 a year. It is estimated that at the present time individuals pay from 4 to 5 per cent of their income for medical care. One physician would take care of about eight hundred and thirty-three people. It was contemplated to have the wife and family of the Government employee included. The children would be on a sliding scale.

"Colonel Glenn I. Jones, who was present by invitation, stated that he had been invited to a meeting of the Home Owners Loan Association which was organizing a plan for taking care of the health of its families. He stated frankly that he had been offered the general management of this organization. The conference he attended lasted two and one-half hours. He promised then that he would attempt to draw up an organization chart. He first suggested a small clinic with physicians and consultants. He told them frankly that if the Medical Society of the District of Columbia disapproved their efforts that there would not be any available medical assistance which could be depended upon. He stated that he had consulted Drs. C. S. White, T. A. Groover, A. C. Christie, and also William Gerry Morgan. He learned that they were opposed to the entire proposition of the prepayment plan."

By Mr. Leahy:

Q.—Now, Doctor, without reading all the rest of these minutes which are therein, I refer you particularly to a portion of a minute which has been read and call your attention to page 2 of this minute. Do you see where I have indicated (handing minutes to witness)? A.—I do.

Q.—Did you make a statement in the manner and form as reported on the minutes?

Mr. Lewin:—Objected to. The manner and form, what does that mean?

Mr. Leahy:—Well, as stated in the minutes. I just want to know what he said.

A.—My statement is not fully represented in the minutes.

Q.—In that minute which I have just directed your attention to you are purported to have made a statement following Colonel Glenn Jones's talk. A.—Yes.

Q.—What did you say, as a matter of fact? A.—I said I had attended the meeting at Dr. Morgan's office two sentences previously, that I heard the statement made by Dr. Jones at that time and, so far as the minute refreshes my recollection, I am represented as saying something which needs extensive qualification.

Mr. Lewin:—Will you show us what that is you have there?

Mr. Leahy:—Will you kindly then state what was said by you at that time? A.—That it was obvious that much of our information was based on rumor; that the only concrete evidence about the plan was the prospectus; that the plan had not yet been fully organized; wasn't fully completed; wasn't ready to go into action. If and when it did go into action and came into conflict with the Medical Society in any way our attitude would have to be entirely predicated on our own organizational rules and regulations. That we might have to consider the question of contract practice; that in that case it might be necessary to discipline members if they entered into contracts or contract practice contrary to our regulations; that if the relations to hospitals were undesirable from a medical point of view our action would be limited to such influence which we might exert through our members, who were members of the medical staff of the hospital, but that we could not directly control the hospital for reasons well known to ourselves.

Q.—Doctor, when you spoke about contract practice, and the question of disciplining members, with reference to any regulation the Society may have had in regard to contract practice, can you refer us to any regulation you had in mind? A.—Yes, one adopted in amended form for March 1937, immediately preceding this meeting of June 1.

Q.—And is that the amendment to what has been called Article 4, Section 5? A.—Yes, that is the one to which I refer.

Q.—Now, as a matter of fact, had that particular article been in the constitution for some time: Do you know how long?

A.—To my recollection since January 1936.

Q.—Do you recall whether the adoption of that particular article had anything whatsoever to do with Group Health Association? A.—Nothing whatsoever.

Q.—And did the amendment of the article which you state had been adopted in March 1937 have anything whatsoever to do with G. H. A.? A.—Nothing whatsoever.

Q.—To your knowledge did anybody in the executive committee or in the District Medical Society have any knowledge of anything about G. H. A. in March 1937? A.—Not to my knowledge; I had none.

Q.—Did the executive committee of the District Medical Society have under its jurisdiction the discretion about the adoption or rejection of the amendment of March 1937? A.—These amendments to the constitution are usually considered, perfected and recommended for adoption or not to be adopted before they are considered by the Society itself.

Q.—At any discussion with reference to this amendment by the executive committee of the District Medical Society did you ever hear G. H. A. mentioned? A.—Never.

Q.—Without going into the details, Doctor, but just substantially, so that we may know, did this amendment which you state was adopted in 1936 and amended in March 1937 have reference to any particular object whatsoever? A.—It did.

Q.—And what was the object to which the amendment was directed? A.—It was directed toward providing the Society with a means of regulating its members with regard to contract practice in so far as the contract might be out of accord with ethical principles and of our conception of good public policy.

Q.—Had it been occasioned by any particular condition which existed with reference to the practice of medicine in the District of Columbia? A.—It had been occasioned by a very disagreeable problem which arose here in the District.

Q.—And did that problem have anything to do with G. H. A.? A.—Nothing whatsoever.

Q.—What did it have reference to?

Mr. Lewin:—Objected to as immaterial.

THE COURT:—Overruled.

A.—It had to do with a complaint of a member against an industrial medical clinic which had formerly employed that member but which had summarily discontinued his services and employed another member.

Q.—That clinic was not the G. H. A.? A.—It was not.

Q.—And that clinic was in operation when, at what period of time? A.—Prior to 1936, January 1936.

Q.—Now, out of this discussion in the executive committee special session of June 1, 1937 what action did the executive committee take, Doctor? A.—The only action it took was to authorize the appointment of a subcommittee to gather facts relative to Group Health Association for presentation to the executive committee for its guidance.

Q.—And do you recall who was selected by the committee or appointed on that subcommittee? A.—I don't recall except that Dr. F. X. McGovern was chairman.

Q.—I now show you the minutes. See if they refresh your recollection. I am indicating the third page, and the top thereof. A.—That represents the personnel of the committee.

Q.—F. X. McGovern, Chairman; R. Arthur Hooe; Earl R. Templeton; A. J. Connelly; David Davis; William T. Gill Jr. That committee was appointed on the motion of Dr. Hooe when, in the next to the last paragraph, Dr. Hooe interrupted to state he wanted to change his motion to the effect that a subcommittee be appointed to cooperate with it, that is, to cooperate with the committee on economics which Dr. Verbyrcke was chairman of, and that the information should be obtained. "Seconded and adopted."

Doctor, did you have any official connection, by reason of being a delegate to the House of Delegates of the American Medical Association, with this subcommittee, which was appointed on June 1? A.—None.

Q.—So far as your knowledge goes now, Doctor, is that the only action which came out of this special meeting of the executive committee on June 1? A.—That is the only action taken.

Q.—And is that the first action of any sort to your knowledge that was ever taken by the District Medical Society? A.—That is the only action taken.

Q.—And now, following the appointment of this subcommittee on June 1, 1937, when was the next time, if at all, when you heard personally about G. H. A.? A.—I heard nothing except the gossip that goes around doctors' offices and hospital corridors with respect to this report.

Q.—Did you attend the convention of the American Medical Association at Atlantic City in June 1937? A.—I did.

Q.—Did you hear anything said about G. H. A. at that time? A.—I discussed it with such colleagues as I met in Atlantic City, and I discussed it with Dr. Woodward on perhaps several occasions.

Q.—Do you know whether any information was given to the House of Delegates, as a body, or to any committee thereof, on that occasion? A.—I myself made a brief report about what we had learned in Washington.

Q.—To whom did you make that report? A.—I made it to the House of Delegates, as I recollect it.

Q.—Do you recall whether, as a result of information which was given to the House of Delegates at the Atlantic City convention, any action was taken by the A. M. A. with reference to G. H. A.? A.—According to my best recollection I had no opportunity to address the House of Delegates until Thursday, which is the last meeting day of the House of Delegates. It was at a time after all the reference committees had considered the matters brought before them, and it was in the late hours of the meeting of the House of Delegates. It was received as information only and no action was taken.

Q.—By the way, do you recall the date of this meeting at Atlantic City? A.—I would say roughly from June 10 to June 15.

Q.—When was the next time you had any connection with any discussion had or action taken with reference to Group Health Association? A.—On June 21st, at a meeting of the executive committee.

Q.—Where was that held? A.—In the usual meeting place at the Medical Society Building.

Q.—Do you recall what was the occasion of the meeting of the executive committee on June 21? A.—To receive the preliminary report of the fact-finding committee, Dr. McGovern chairman.

Q.—That is the committee which you say was appointed on June 1? A.—Yes.

Q.—Where you present at that meeting? A.—Yes.

Q.—Do you recall now, independently, from your recollection, what occurred at that time? A.—Dr. McGovern reported for his committee that they had diligently been seeking the information desired regarding Group Health Association, and had been able to obtain no official information to communicate.

Q.—Do you recall whether you made any report at the time with reference to what you had attempted to do? A.—Yes, I reported my attendance at the American Medical Association meeting; my efforts to communicate something of these facts, and rumors, to the House of Delegates.

Q.—Did Dr. Verbrycke make a report at that time, do you know? A.—June 21, I think. That was the meeting at which he submitted a report as chairman of the economic committee.

Q.—I will just show you what has hitherto been offered in evidence as the minutes of the special meeting of the executive committee of the Medical Society, June 21: Will you glance at those and see if in any way they refresh your recollection as to what occurred at that meeting? A.—He reported at that meeting that he had met with the fact-finding subcommittee, he as chairman of the economic committee; that I had been present by invitation; that from what information could be obtained that the prospectus before us indicated a movement which was not a drop in the bucket to what this movement might grow to; that certainly the next thing should be the executive committee should notify—

Mr. Lewin:—Wasn't that report in writing; and if it was I will object to this testimony.

Mr. Leahy:—It was not in writing; this portion was not in writing.

Mr. Lewin:—Are you refreshing your recollection or testifying independently?

THE COURT:—If he is relying solely on the minutes, why don't you tell him to read the minutes?

Mr. Leahy:—Dr. J. Russell Verbrycke Jr., who was present by invitation, stated that he, with the subcommittee and the executive committee, had had a meeting, and it was ascertained that the Home Owners' Loan project for giving medical care was not a drop in the bucket to the widespread plan for taking care of all Government employees. Dr. Macatee had been present at the meeting by invitation. Mr. Ross Garrett appeared to have a great deal of information which he divulged to the committee.

Q.—Who is Ross Garrett? A.—He is administrator of Health Security Administration.

Q.—What is Health Security Administration? A.—It is an eleemosynary institution for bringing contact between indigent

and near indigent patients with facilities for their medical care, in hospitals and dispensaries.

Q.—Under whose supervision is it administered?

Mr. Lewin:—Objected to as immaterial.

THE COURT:—Sustained.

Mr. Leahy:

"It was decided that it was only right that the executive committee should know all the facts and, therefore, Dr. Brown and Mr. Russell should appear before the executive committee and give all the facts."

Q.—Who was Dr. Rolfe Brown? A.—He was purported to be the newly appointed medical director of Group Health Association.

Q.—And Mr. Russell? A.—He was vaguely in the movement, associated with the movement on behalf of the Home Owners' Loan Corporation.

Mr. Leahy:

"Mr. Garrett has emphasized that any action taken by the Society should be a matter of all haste as he had definite information that the material and wherewithal for setting up a medical care prepayment plan was definitely at hand. It was ascertained that the Government is allowing free time for the activities destined to bring a plan of medical care to Washington. No one seemed to be able to find out whether Dr. Brown and Mr. Russell were on the Government payroll. It was mentioned in this connection that with various New Deal projects workers were not always shown to be on the payroll but their source of income from the Government appeared unmistakably. Dr. Verbrycke reported at this point with a detailed plan that had been organized by the subcommittee as an acceptable substitute for the cooperative medical service plan."

"Dr. Verbrycke stated that he had sent by air mail an outline of the cooperative medical service plan to Dr. W. C. Woodward, and requested that Dr. Woodward meet with him in Washington. Every effort was made by Dr. Woodward to ascertain who was financing the project. He met with little success with his inquiries."

"It was stated that Dr. H. C. Macatee at the meeting of the House of Delegates in Atlantic City, outlined the plan that was all ready for trial in Washington. It seemed as though the attitude was: "We are sorry; we have no solution; you work it out."

By Mr. Leahy:

Q.—Doctor, do you recall what the plan referred to in the abstract as a detailed plan that had been organized by the subcommittee was? I don't want the details of it. A.—It was a report made by the committee on economics, Dr. Verbrycke, chairman, in which the salient principles of some cooperative plan might be considered by the medical society to offer to the public.

Q.—I am not going to take the time to read all the excerpts which were made, or the abstracts of those who talked at that meeting. But in the executive committee meeting we had Dr. Verbrycke, Dr. Macatee, Mr. Garrett, Dr. Verbrycke again, Dr. Lawn Thompson, Dr. Earl Templeton, Dr. Thomas Neill, again Dr. Macatee, and again Dr. Macatee. Do you know whether any official action was taken by the executive committee at the conclusion of this meeting on June 21, 1937?

Mr. Lewin:—Will you ask him whether he knows that independently of these minutes?

THE COURT:—Those minutes are the best evidence of that, Mr. Leahy.

Mr. Leahy:—No, not if he has an independent recollection: I think he may state it. They are not verbatim; they are abstracts.

THE COURT:—Any resolution reporting the action would reflect the official action.

Mr. Leahy:—If there was a resolution, your Honor, yes.

By Mr. Leahy:

Q.—Do you recall whether any action was taken by the committee?

Mr. Lewin:—I object to it on the ground that the resolution indicates the formal corporate action and is the corporate action.

THE COURT:—The minutes are the best evidence. If there is any question about it, you may inquire further, but if there is no question, then the minutes do show what, if any, action was taken.

Mr. Leahy:—I was not trying to prove the contents of any resolution.

By Mr. Leahy:

Q.—Was there any action taken at all at that meeting?

Mr. Lewin:—Objected to. The Court has already passed on it.

Mr. Leahy:—I am just asking him yes or no.

Mr. Lewin:—Yes, I know that, but I object to it.

THE COURT:—Those minutes would show it. He can look at the minutes.

By Mr. Leahy:

Q.—Glance at those minutes. A.—Yes, there was action taken.

Q.—Will you kindly indicate in the minutes what action was taken by the executive committee? A.—“The Secretary made a motion that a special meeting of the executive committee be held on the evening of Wednesday, June 23, and that Dr. Henry Rolfe Brown be informed that his presence would be welcomed; also the presence of any of his confrères.

“This motion was seconded and in the discussion the question of executive session on that evening was brought out. It was decided that this could be worked out afterward. This motion was adopted.”

MARCH 21—AFTER RECESS

TESTIMONY OF DR. HENRY C. MACATEE

DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

Q.—Doctor, I was just asking you about the special meeting of the Executive Committee of the Medical Society of the District of Columbia under date of June 21, 1937. Would you kindly glance those over, please, and see if that paragraph correctly records what you stated on that occasion? Does it correctly record what you said, Doctor? A.—The minutes do not convey the spirit of what I said on that occasion.

Q.—What did you say on that occasion? A.—I said substantially what I said on a previous occasion in which I stated that the record would have to be qualified by my conviction that so far as the Medical Society itself could proceed in this or any similar circumstance it would have to be limited by its own constitution and by-laws, and what it could do under the constitution and by-laws in disciplining its members if they should become involved adversely with any provision of the constitution and by-laws, and that, so far as hospitals were concerned, we should only exert an influence through our own members so far as that might go.

Mr. Kelleher:—May we have the statement read to which the witness is referring?

Mr. Leahy:—Yes. You mean the statement from the minutes?

Mr. Kelleher:—The statement of Dr. Macatee.

Mr. Leahy:—The statement by Dr. Macatee is in the minutes, on the third page, and I will read everything he said:

“Dr. H. C. Macatee, in addressing the meeting, stated that the Principles of Medical Ethics of the American Medical Association had been amended at the meeting in Atlantic City so that the interpretation of the free choice of physicians would be broadened with the idea of adjusting itself to the various compensation laws. He then recited some of the details of his attempts to bring to the House of Delegates the important situation that now confronts the profession in Washington. It was not until Thursday, the last session of the Delegates, that he was able to bring the matter on the floor, and as stated scant attention was given to it. Details of Senator Lewis's presentations to the House of Delegates were given. It appeared that the Senator had come before the House of Delegates with the knowledge and approval of the Nation's Chief Executive. He let it be known that the President was sympathetic with the American Medical Association and its motives, and he, Lewis, wanted to be advised as to just what the profession wanted done. The Kopetzky set of resolutions were definitely tied in with a conference”—

Mr. Lewin:—The part that you are reading now—does not that refer to something else that is not germane to this case?

Mr. Kelleher:—And it is not in evidence, either.

Mr. Leahy:—Oh, yes; it is all in evidence:

“The Kopetzky set of resolutions were definitely tied in with a conference that had been held at the White House last April, at which Miss Esther Everett Lape and other socially inclined members of the profession were present. Specifically, representatives of the American Medical Association were excluded. In effect Kopetzky's series of resolutions, after going to a reference committee, were in essence similar to what was given two years ago to the plan sometimes known as the Washington Plan presented by Dr. Macatee. In effect the American Medical Association had accumulated considerable data and these data were available to the various state societies and to the workers in the United States Government. The plan from New York was predicated on the principle that care of the sick indigent was a taxpayers' problem; that the doctor should be paid for taking care of them; further, that hospitals should be financed by the Government and that no longer would there be many hospitals in bad financial straits; further, the Government would subsidize scientific investigations of various hospitals.

“Dr. Macatee, in summary, stated that two ways available in combating or controlling any such scheme as recently proposed in Washington might probably be handled (1) through disciplining our own members who undertook to participate and (2) the possibility of doing something to recalcitrant hospitals through pressure on their staffs. He mentioned the various cooperative plans that were now in force; that the Ross-Loos Plan of California and various county societies had through their medical societies handled the situation. There was now a bill before the legislature in the state of Wisconsin that would definitely

prevent any interference with doctors who were members of societies in their activities in any scheme of socialized medicine. In other words, the societies would be prohibited by law to discipline their members.”

By Mr. Leahy:

Q.—Does so much of what you state, Doctor, with reference to the bill in the state of Wisconsin legislature, represent what you said on that occasion? A.—I take it, Mr. Leahy, that it does. That was a very discursive report as Delegate, having recently returned from a meeting of the House of Delegates.

Q.—Doctor, in pursuance of the motion which I read this morning from the minutes, that Dr. Brown and Mr. Russell should be invited to the District Medical Society to a special meeting on June 24, do you recall now whether Dr. Brown appeared on June 24? A.—They were invited to appear on June 23 and actually appeared on June 24.

Q.—Who was there on June 24 with Dr. Brown, if anybody? A.—Mr. Penniman and Mr. Zimmermann.

Q.—Were you present at that meeting? A.—I was.

Q.—Do the minutes record those who were present for the District Society? A.—As I recollect it, the minutes record those present accurately.

Q.—I will show you what purports to be an abstract of the minutes, with a verbatim statement of the statements which were made at that meeting. Do you recall whether they represent what was said on that occasion? A.—I have read this exhibit, or one identical with it, and I think it accurately records the proceedings.

Mr. Leahy:—I am not going to take the time, ladies and gentlemen of the jury, to read all this; it is too much. There are some portions which I would like to bring to your attention, more particularly a statement by Dr. Conklin which was given toward the end of the meeting, as well also as a statement by Dr. Groover:

“Dr. Conklin:—

This is toward the end of the meeting—

“I think that all of us present tonight appreciate just what these gentlemen have done. They have been kind enough, good enough, to come down and meet with us. They have answered all of our questions and have not denied us at all, no matter what their own personal feelings may have been concerning some of it. We are primarily interested in the patient's welfare. That has been demonstrated time and time again in this country and throughout the United States. I am wondering if they would accept a committee of three of the Medical Society to meet with them with a view of making presentation as clearly as possible of the Medical Society's attitude primarily toward this particular proposition from the viewpoint of the patient primarily. I wonder if that would be acceptable. I have no authority to say that the Medical Society would appoint such a committee, but if that would be acceptable to the Medical Society, do you gentlemen think you would accept a proposition of that kind?

“Dr. Brown:—A further meeting to elucidate certain questions?

“Dr. Conklin:—I am sure there are certain ideas that definitely seem to be fixed. There is a possibility in further conference with three representatives of the Medical Society who would go down to the Home Owners Loan Corporation and talk these things over and see whether or not some alternative proposition will operate that would be acceptable to some eight hundred practicing physicians here in the District of Columbia. I would think it would be a wonderful thing.”

Mr. Lewin:—Will you read what Dr. Brown said?

Mr. Leahy:—Oh, surely:

“Dr. Brown:—Our objectives are identical with those you have expressed. We have no objections to meeting any committee of three. “The Chairman:—To confer with their own committee if they would like to have such a meeting.

“We have a board of trustees,” said Mr. Penniman. “It might not be a bad idea to have as many men as they want to discuss the thing further. There is no question that other units in the Government are going to undertake the same thing.

“Dr. Conklin:—If we may have a definite assurance of tentative acceptance of this plan. I think your coming down has been just the most successful thing with a view to definite harmony. I think that is what we want. We want to see these men and greet these men and have them certainly not fighting organized medicine, because I think any doctor who attempts to do that is doomed to failure. We want to have this committee of three representatives meet with you and talk these things over with a possibility of making some little rearrangement wherein we can come before our entire membership and present this thing and recommend adoption.

“Dr. Brown:—We are anxious for cooperative intercourse. We would be glad to have you consider those plans.

“Mr. Penniman:—I want to say what I should have said and would have liked to have said at the outset. Reversing the words of Shakespeare, I came down with the idea of praising Caesar, not burying him. I have the most profound respect for the medical profession, always have had and always will have. It is the desire of this Association to work to the ultimate end that we may give our employees medical care—I speak not as an official of the Home Owners Loan Corporation, but as one of the employees—medical service of the highest type within their ability to pay and to solicit at every point of view possible the full cooperation of the Medical Society of the District of Columbia. Glad to

have it. I would like to make a suggestion. Since we have a board of trustees consisting of eleven employees of the Corporation who have been elected by the employees, if you would be good enough to drop us a line so we can put it clearly to the board, your point of view, I am safe in saying that it would meet with a ready response.

"Dr. Conklin:—You mean, the point of view as to this committee of three?"

"Mr. Penniman:—Yes."

And at that time Mr. Penniman and Dr. Brown and Mr. Zimmerman left the meeting. Then following a suggestion on the part of the chairman, after those three had retired:

"The chairman said he would welcome a motion to the effect that a copy of these minutes be sent to the active membership so they would know what was going on. It was his opinion that 90 per cent of the membership know nothing about this plan."

Then follow pages of discussion back and forth upon a motion, and finally, after expressions by Ruffin, Bennett, Hooe, Schoenfeld, and I don't know how many more, there was a motion.

By Mr. Leahy:

Q.—Was a motion adopted, Doctor? I am just asking you because I think there was, but I cannot find it in quickly looking this over. A.—A proposition was adopted at that meeting finally, and a committee to carry out the purposes suggested by the secretary was authorized.

Q.—Was a committee appointed? A.—My feeling is that Dr. McGovern's committee was continued for that purpose.

Mr. Lewin:—It gives the names of the members of the committee.

Mr. Leahy:—Dr. F. X. McGovern, chairman; H. C. Macatee, Earl R. Templeton, William P. Herbst Jr., Coursen B. Conklin.

The Witness:—That was the same committee. That was part of the old committee, but evidently revamped for those purposes.

By Mr. Leahy:

Q.—Did you serve as a member of that committee, Doctor? A.—I did.

Q.—Do you recall now the date upon which you went down to talk with the board of trustees of the G. H. A.? A.—That was July 26, 1937.

Q.—In the interval can you recall whether the committee which had been appointed on June 1 in order to try to get some information and data about G. H. A. was still functioning? A.—Yes, sir. It reported to a meeting of the Executive Committee on July 12, 1937. Q.—I now show you what has already been introduced in evidence as the minutes of the Executive Committee of the Medical Society of the District of Columbia for July 12, 1937. Are these the minutes of that meeting to which you just referred? A.—I have seen that exhibit, and I think it is a fair transcript of what occurred.

Mr. Leahy:—That is a long time, too, ladies and gentlemen. I am not going to take your time to read all of it—just a few excerpts:

"Dr. F. X. McGovern, Chairman of the subcommittee that was appointed to confer with representatives from the Group Health Association, Inc., was recognized and made a motion that his report be given preference over the other agenda for this meeting and that it be heard at this time. It was duly seconded and adopted.

"For the information of the new members of the Executive Committee Dr. McGovern outlined the prepayment medical care plan that has been set up by the Home Owners Loan Corporation, stating that the Executive Committee had appointed a subcommittee to meet with the committee on Medical Economics to study the prospectus and bring a report back to this committee. A report which was prepared by Dr. J. Russell Verbruycke, who was then the chairman of the committee on Medical Economics, was approved in principle by the Executive Committee at a subsequent meeting. Since that time the subcommittee has met and studied and reviewed supplementary plans by Dr. Verbruycke which Dr. McGovern offered as a report of the Executive Committee tonight.

"Dr. H. C. Macatee interpolated for the information of the new members of the Executive Committee that upon the adoption in principle of the report of the subcommittee, the subcommittee was given instructions to negotiate on the basis of the report with the Medical Service Corporation, and this supplementary report is now made to gain alternative instructions.

"Dr. McGovern, in answer to why the subcommittee had not met with the Group Health Association representatives up to this time, said that his committee did not feel that it was ready to meet until it had something concrete to offer. He stated that within the past week Dr. Olin West, Secretary of the American Medical Association, was in the city and met with the committee and it was felt that very important information was obtained through this meeting. He added that he had a telegram from Dr. West stating Drs. W. C. Woodward and R. G. Leland, the latter Director of the Bureau of Medical Economics of the American Medical Association, would be in Washington Wednesday morning of this week."

Then other members spoke, including Dr. Templeton and Dr. Sprigg and Dr. Hooe, and then Dr. McGovern again. Dr.

Ruffin spoke, and Dr. McGovern added that his committee "did not know just what the attitude of the Executive Committee of the Society would be, whether to fight this thing with the weapons at hand or possibly set up an organization to combat it. The committee felt that some definite instructions should be given along that line."

Then followed talks by various members of the committee, and Dr. Macatee spoke and said that he had talked to a patient who was an attorney in the Corporation, and he said it could be done perfectly legally, and that if his recollection was correct the papers had gone over this attorney's desk and they could do anything not contrary to the law or the Constitution for the benefit of their employees.

"With respect to the duties of the subcommittee Dr. Macatee pointed out that according to the letter which was addressed to the members of Group Health Association it was clear that at least one medical man had made a contact with the Group and that they are on the verge of going into action. It had been thought by the subcommittee that we could probably go before the trustees and we could ask them what their prospectus meant when it said that they wished to enter into the fullest cooperation with the Medical Society of the District of Columbia, to ask for representation on their board in an advisory capacity and they wished to do their work in a harmonious way. We thought we might say to the board of trustees that the Medical Society had looked upon the organization with some concern."

The point was raised as to whether the subscribers would not, in the long run, have the free choice of physicians, and whether they understood that as soon as some grave medical problem arose among the employees they would follow the usual human instinct and say, "We don't want these hired men; we want 'he best,'" whether that would be disruptive of the whole plan whether in view of those facts or other facts they might not feel that the principle of organized medicine, that the free choice of a physician is essential to the success of any proposition, and whether they might convey something looking to the entire medical profession of the District as a source of the medical and surgical services needed.

"If they could consider that we would be glad to take it up with the Medical Society and see what could be worked out. It is for this committee to decide whether it is likely that any good will come from such a meeting."

There followed discussions by the secretary, Dr. Ruffin, Dr. Hooe, and then the motion which theretofore had been offered was withdrawn.

"Dr. Ruffin made a motion that the subcommittee be instructed to meet with the Home Owners Loan Corporation representatives to be addressed by Dr. Macatee along the lines discussed and bring a report back as promptly as possible to the Executive Committee with a view to a meeting of the Medical Society. Seconded and carried."

There followed a good deal of other talk with reference to other matters which are not germane to the point here.

By Mr. Leahy:

Q.—Doctor, I want to ask you whether, in pursuance of that motion made by Dr. Ruffin, you did meet, you personally, and address, along the lines discussed, the board of trustees of the Home Owners Loan Corporation? A.—I did.

Q.—And that was on June 26? A.—July 26, 1937.

Q.—There is a matter contained in the minutes of the meeting of July 12 which I would like to have you explain, please. And that—I think I am right in my memory—is with reference to a supposed or a so-called approved list or White List. Do you know to what I refer? A.—Yes, sir.

Q.—Am I correct in saying that this matter also came before the attention of the meeting on July 12? A.—It did.

Q.—Do you recall, Doctor, at what date, if any, any authorization was made to prepare an approved list which has been called a White List? A.—That was incorporated in the constitutional amendment adopted in March 1937, in which the Executive Committee was charged with the duty of preparing such a list.

Q.—Do you recall whether anybody upon the Executive Committee had been working upon the list from the date in March when authorization therefor was made? A.—There was a subcommittee of which Dr. McGovern was either chairman or a member, which was working on that duty.

Q.—I ask you, Doctor, if the preparation of an approved list had anything whatsoever to do with Group Health Association? A.—Nothing whatsoever.

Q.—I will ask you further what the approved list resulted from as an activity of the District Medical Association? A.—It resulted from a hearing on a complaint by the Executive Committee against an industrial clinic which, in turn, resulted in the original adoption of Chapter 9, Article 4, Section 5, which was amended in March 1937.

Q.—Do you recall, Doctor, whether or not any legal advice had been sought by the Society with reference to the amendment of this approved list?

Mr. Lewin:—I object to that, may it please the court, as totally irrelevant, incompetent and immaterial.

THE COURT:—What was the question?

Mr. Leahy:—I asked the Doctor whether he recalled, with reference to this approved list, and also the amendment in March, under which the approved list was authorized, any advice of counsel had been sought and, if so, from whom?

THE COURT:—Is that the White List?

Mr. Leahy:—Yes, sir.

THE COURT:—Objection sustained.

Mr. Leahy:—May we approach the bench for just a moment, if your Honor please?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the Court in a low tone.)

(There was extended discussion at the bench dealing with the nature of testimony that could be offered showing the chronology and events leading to the development of the approved list of organizations. The Court ruled that testimony by an attorney to show the Society took counsel was irrelevant and immaterial.)

Mr. Leahy:—Doctor, I think just before recess I was asking you some questions about the approved list. I will read from the minutes on page—sometimes it is 11 and sometimes 14, of the minutes:

"Dr. McGovern stated that he requested the various county medical societies in Virginia and Maryland, within 10 miles of the District of Columbia, to send him a list of their membership. He was not very successful by letter and intended to contact the secretaries personally. He added that there were a few physicians practicing medicine in the District of Columbia who were not on the rolls of the Society. The Society's office was busy at the present time checking the list of physicians and surgeons as classified in the newest telephone directory and the Commission on Licensure had been approached to obtain a list of all licentiates in the District of Columbia.

"The Chairman, Dr. Sprigg, stated that he requested a list of the licentiates and the Society's office was informed that the records of the Commission on Licensure would be available if the Society could supply clerical help to type the list.

"Dr. McGovern read a proposed list of approved organizations, groups and individuals.

"Dr. Macatee suggested that the words 'employed by' be substituted for the words 'connected with' in item 10. With this change the list was approved, upon motion, duly seconded and adopted, as follows:

"1. All members of the Medical Society of the District of Columbia.

"2. Medical staffs of all hospitals, institutions and clinics, each member of which has been approved by the Medical Society of the District of Columbia.

"3. The United States Government Medical Personnel on duty in the District of Columbia, or within 10 miles thereof, i. e., the United States Army, Navy, Public Health Service, and the Veterans' Administration.

"4. The Health Officer and attached medical personnel.

"5. Membership of the District of Columbia Dental Society.

"6. Membership of the Homeopathic Medical Society.

"7. Members of the Montgomery County (Md.), Prince Georges County (Md.), Fairfax County (Va.), and Arlington County (Va.) Medical Societies, who reside within 10 miles of the District of Columbia.

"8. Members of the Alexandria Medical Society.

"9. The following compensation clinics: Farragut Medical Clinic, operated by Frank E. Gantz; First Aid Station, operated by Arch L. Riddick; Harry M. Lewis Clinic, operated by Harry M. Lewis; Market Compensation Accident Clinic, operated by M. J. Kossow; Northeast Insurance Clinic, operated by G. Henry Rawson; Union Market Workmen's Compensation Clinic, operated by Maxwell Hurston; Washington Industrial Accident Clinic, operated by Edward Clark Morse; Washington Medical Building Workmen's Clinic, operated by Charles S. White.

"10. All medical personnel employed by the Federal or Municipal Governments within the District of Columbia or within 10 miles thereof.

"11. Membership of the Medico-Chirurgical Society (colored medical society).

"12. Membership of the Robert T. Freeman Dental Society (colored dental society).

"Dr. Raymond T. Holden Jr. inquired as to the personnel (medical) of the proposed Group Health Association, Inc.

"Dr. Hooe pointed out that it was a separate individual corporation and would have to be approved as a single unit. As a matter of information, Dr. Hooe would inquire if he was right in the assumption that this approved list would not have to be submitted to the Society but from tonight on would be filed in the Secretary's Office for reference."

Then follow certain discussions with reference to that by Dr. Hooe, the Secretary and Dr. Ruffin.

"Dr. Macatee said he understood that the list as read by Dr. McGovern was not a complete list. Was it to be assumed that when it was added to that another registered letter would have to be mailed to nine hundred or more members?

"Dr. Hooe said that there were a good many fine men who were not members of the Medical Society, such as Drs. Henry R. Elliott, R. J. Kemp and others. When these individual names were obtained they would be submitted by Dr. McGovern to the Executive Committee for approval.

"Dr. Hooe's motion, with amendment by the Secretary, was duly accepted."

By Mr. Leahy:

Q.—Doctor, do you recall to what you referred when you said that you understood that the list as read by Dr. McGovern was not a complete list? A.—Dr. McGovern, in making his report, spoke of the great difficulty in formulating a complete list, said he had incomplete information from the surrounding counties; incomplete information from our own district, and that was the best he could do at the time.

Q.—Did that approved list, as it came before the Executive Committee on July 12, 1937 have anything whatsoever to do with the approval or disapproval of Group Health Association, Incorporated? A.—It did not.

Q.—Why not? A.—Because Group Health Association had not been at a stage of development where it had asked for approval or where approval could be given for lack of information.

Q.—Did the Executive Committee at that time consider that it had sufficient information about Group Health to approve or disapprove Group Health Association? A.—It did not.

Q.—Did you tell us that this approved list had been authorized in March of 1937? A.—It had been directed to be prepared.

Q.—And was that in connection with any constitutional amendment which had been adopted? A.—It was part of that constitutional amendment, as I understand it.

Q.—Do you recall whether subsequently the list was mailed as directed by the Executive Committee on that night to each member of the Medical Society? A.—I am so informed.

Q.—There was, was there not, a direction, on that evening, to mail that to each member of the Medical Society? A.—Yes.

Q.—Do you recall whether at any time there was any direction by the Executive Committee that it should be mailed also to the hospital? A.—There is not within my recollection.

Q.—Do you recall when it was that the list was mailed? A.—By reference to the record I find that it was mailed July 29, 1937.

Q.—With the exception, Doctor, of this approved list in that particular meeting, what, other than what we have drawn attention to, and what is contained in the minutes, occurred, or was said or done with reference to Group Health Association on July 12, 1937? A.—Nothing.

Mr. Lewin:—May I have that question read?

Mr. Leahy:—The substance of the question is was there anything which was said or done which is not recorded in the minutes.

The Witness:—Nothing.

Q.—Now, do you recall, following this meeting of July 12, when next anything was said and done, or done by the District Medical Society, or the Executive Committee thereof, with reference to Group Health? A.—The subcommittee of the executive committee met with the Board of Trustees of Group Health Association.

Q.—And what was the date of that meeting? A.—July 26, 1937.

Q.—Do you recall now who were present at the meeting, representing the subcommittee of the Medical Society of the District of Columbia? A.—Dr. McGovern, Dr. Conklin, Dr. Verbyck by invitation; Dr. Groover, and I think Dr. Templeton was there, but I am not sure.

Q.—Did you mention Dr. Conklin? A.—Yes.

Q.—By the way, Dr. Groover is dead now? A.—He is.

Q.—And where did you meet that evening? A.—In a large room at the office of the Home Owners Loan Corporation.

Q.—And where was that located at that time? A.—I don't know; I think Indiana Avenue and First Street.

Q.—Do you happen to have with you a photostatic copy of what occurred at that meeting? A.—No, I have not.

Q.—Do you recall at that time, Doctor, whether you personally discussed with the Board of Trustees of Group Health Association the questions pertaining to Group Health Association, and the attitude of the District Medical Society thereto? A.—I did, as instructed by the meeting of July 12, I think it was.

Q.—While you are looking for the exhibit, Doctor, following that meeting was any report made to the District Medical Society with reference to it? A.—There was a report to the executive committee at the meeting of July 27, the following day, and then a report from the executive committee to the Medical Society on July 29, special meeting.

Q.—Does the exhibit which I now ask you to look over record what was said by the representatives of the subcommittee on that particular occasion? A.—It does, surprisingly well.

Q.—I will ask you, Doctor, if your statement begins as recorded at the bottom of page 1. A.—Yes.

Q.—And did you open the meeting in accordance with the motion which was made earlier, on June 24, meeting of the executive committee? A.—Wasn't it July 12?

Q.—July 12 meeting? A.—Yes.

(Here was read in full again Dr. Macatee's statement of July 26, 1937 as published previously in the testimony of Mr. Penniman.)

And then follows a further discussion on the subject by Dr. Groover.

By Mr. Leahy:

Q.—Now, Doctor, do you recall whether anything further was said or done at that particular meeting that is not recorded here in the minutes? A.—I do not.

Q.—Do you recall whether at any time following this meeting of July 26, 1937 any further or additional information was given to your subcommittee by Group Health Association that you did not have on July 26 when you discussed the matter with them? A.—No information was ever voluntarily given us, that I know of.

Q.—Was there any information given at any time with reference to any of the suggestions which you brought to the attention of the Board of Trustees that night with reference to answering the question as to the legality of G. H. A., and the question you had raised about it? A.—The Medical Society had no further official communications from Group Health Association that I know of.

Q.—Of any kind or character? A.—I say of any kind or character.

MARCH 24—MORNING
TESTIMONY OF DR. HENRY C. MACATEE
DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

Q.—Doctor, I believe that on last Friday you had just told us of the meeting which was held on the 26th day of July between the board of trustees of G. H. A. at H. O. L. C. headquarters and the committee of the District Medical Society. Do you recall whether any report of that meeting was made to the District Medical Society? A.—Oh, yes; there was a report made by the committee; yes.

Q.—Do you recall what day that report was made? A.—It was made, first, to the Executive Committee on the 27th of July, and from the Executive Committee to the Medical Society on the 29th of July.

Q.—I am going to show you what purport to be the minutes of that meeting of the Executive Committee on the 27th day of July. Will you kindly look those over and see if you can identify them, Doctor? A.—I have read this photostat of the minutes recently, and it is a record of the action of that meeting.

Mr. Leahy:—Just a brief excerpt, ladies and gentlemen, from the minutes of the meeting of the Executive Committee:

"A special meeting of the Medical Society of the District of Columbia, held Tuesday evening, July 27, 1937 at 8 p. m.

"Dr. F. X. McGovern, chairman of the subcommittee that had been appointed to make contact with the Home Owners Loan Corporation medical unit, was called upon to make a report. He opened his remarks by stating that pursuant to recommendations made at the last special meeting of the Executive Committee he had prepared a letter which was sent to Mr. William F. Penniman in which letter request was made for copies of (1) contract of the Home Owners Loan Corporation; (2) adopted constitution and by-laws; (3) form or forms of applications for membership, and (4) any form of contract or agreement setting forth the service to be rendered to employees and their dependents.

"Dr. McGovern stated that Mr. Penniman had not given him a written answer but had called him up and asked that he have luncheon with him at the Raleigh Hotel. On this occasion he frankly stated that he would give responses to the questions asked in the registered letter that had been received, but copy of contract asked for he said he would have to refuse to exhibit. He thought the Medical Society's asking to see this contract was quite similar to going into Garfinkel's department store and asking them to show the contract they had with some firm with which they were doing business. Dr. McGovern then proceeded to read the prepared report as follows:

"Known facts in re the Home Owners Loan Corporation.

"1. Corporation, Group Health Association, Inc.

"2. In Home Owners Loan Corporation with which it had a contract.

"3. Mr. W. F. Penniman is president, Mr. R. T. Berry is secretary-treasurer. Dr. Henry Rolf E. Brown is medical director.

"4. Instituted presumably to give medical care, complete, to any and all members of the H. O. L. C. who may care to join in.

"5. Non-profit voluntary prepayment insurance organization.

"6. Must be in some way related, possibly by contract, to Home Loan Bank Board.

"7. President, Mr. Penniman, avoided replying by letter to an official letter from the Society to him.

"8. Mr. Penniman refused to give your committee a list of physicians employed by the corporation.

"9. Articles of incorporation so worded that all Federal Employees except Army and Navy may belong.

"10. President, while he states that purpose of the corporation is to provide medical service to low-income individuals, at the same time admits that the constitution and by-laws do not establish any income level.

"11. Invites attention to many other similar organizations in existence throughout the country and claims they do the job better than would otherwise be done.

"12. The lay members of the board of directors sincerely believe that they are performing a needed helpful and humanitarian function for their employees and apparently are firmly convinced that nothing that they are doing is in conflict with the established ethical principles of organized medicine.

"13. Dr. Brown is a physician recently retired from the Veterans Bureau and is being paid a good, under the circumstances, salary as Medical Director. Licensed in the District May 21, 1937.

"14. Whereas the officers of the Corporation express a desire to cooperate with the Medical Society of the District of Columbia, it is a fact that in the beginning and at all times there has been no real effort made to apprise the Medical Society of the District of Columbia of what they were undertaking. They have not considered officially the Medical Society of the District of Columbia during the formative stage of their organization. On the contrary there seems to have been a desire to keep the matter confidential.

"15. Meeting with officials of the American Medical Association on two separate occasions convinces us that the national organization is keenly interested in the whole affair and is solicitous as to how we will consider its relation to us locally and what policy the Medical Society of the District of Columbia will adopt in regard to it.

"16. What might be done:

"1. Consider it unethical.

"2. Control our own members in terms of the ethical requirements of our own constitution and by-laws.

"3. Offer a substitute plan of our own.

"4. Cope with the situation in the courts in terms of the local healing arts practice act.

"17. Your committee met with the board of directors of Group Health Association, Inc. The attitude of organized medicine in regard to the medical ethics in matters of this kind was fully presented to them. Quotations were read to them from the code of ethics of the American Medical Association and other relevant facts were presented. The only reply was made by a Mr. Loomis, member of the board of directors, to the effect that he hoped that the Medical Society would see fit to withhold final judgment until Group Health Association, Inc. had been in actual operation a sufficient length of time to practically demonstrate its purpose and its relation to the community and to the medical profession of the District of Columbia.

"Dr. H. C. Macatee elucidated the various points that had been brought up before the Home Owners Loan Corporation committee on the preceding evening at its home on the 8th floor of the old Acacia Building, First and Indiana Avenue Northwest. He cited particularly a statement by one of the officers to the effect that if and when the project became large enough to include all of the Government workers of the city of Washington, that is, its scope raised to the nth degree, quoting him exactly, there would be room enough for all of the physicians practicing in Washington, and it was freely intimated that they all could be placed presumably on a salary basis, working for the project.

"Dr. Macatee, in continuing, read an excerpt from the latest issue of the Principles of Medical Ethics of the American Medical Association, having to do with the definition of free choice of physicians, as follows:

"The phrase 'free choice of physicians' as applied to contract practice is defined to mean that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patient and physician when no third party has a valid interest to intervene. The intervention of a third party who has a valid interest and who intervenes does not per se cause a contract to be unethical. A 'valid interest' is one where, by law or necessity, a third party is legally responsible either for cost of care or for indemnity. 'Intervention' is the voluntary assumption of partial or full financial responsibility for medical care. Intervention shall not proscribe endeavor by component or constituent medical societies to maintain high quality of service rendered by members serving under approved sickness service agreements between such societies and governmental boards or bureaus and approved by the respective societies."

"The ambiguity of the situation was immediately apparent.

"Dr. Macatee said that he certainly did not read this at the time of the meeting with the H. O. L. C. unit. He did, however, read on that occasion extensively from the Principles of Medical Ethics under which the medical profession is bound, showing that the project as at present constituted could not be expected to be approved by the Medical Society of the District of Columbia, the local unit of the American Medical Association.

"Dr. Macatee was rather inclined to think that there should be no hasty action taken at this time and he would recommend that the four possible solutions as prepared by the subcommittee be not read before the Medical Society. He too thought that it might be possible to bring some accord with the Group Health Association."

Then in connection with the visit of Dr. Woodward and Dr. Leland the minutes record as follows:

"The secretary explained just what had been suggested by Drs. William C. Woodward and R. G. Leland at the time of their visit. It would seem that Dr. Woodward would advise quo warranto proceedings, which proceedings would require a district attorney or United States Attorney for the District of Columbia, who at least was not hostile, that the suit would be filed in his name. He saw many difficulties in following this up. Dr. Leland had given a sketchy verbal outline of a plan whereby a pool of money should be created and this could be built up by either the people in the lower income brackets or even in the higher brackets, and from this pool the care of the sick could be financed."

By Mr. Leahy:

Q.—I am going to show you on page 34 a motion and ask you if you can identify that for us and explain what it is. However, I should conclude the paragraph which I just read with reference to Dr. Woodward and Dr. Leland and their visit:

"The secretary stated that the very next morning after the meeting he wrote to Dr. Leland asking for full details of this plan. Up to date he had received no reply. The secretary opined that the American Medical Association authorities certainly did not have any definite knowledge as to how to proceed in combating the situation that was confronting the Medical Society of the District of Columbia.

"The secretary said he was quite sure that he was in accord with everything that Dr. Reed wanted passed. He would make two motions if acceptable to Dr. Reed:

"1. That a special meeting of the Medical Society of the District of Columbia be called for Thursday, July 29, 1937 at 8 p. m.

"2. That a recommendation be made that the president of the Society appoint a special committee to consider the entire matter with a view to bringing accord, if possible, with Group Health Association, Inc.

"In view of the fact that many of the members thought that report should be made back to the Executive Committee Dr. Reed's motion was finally made to the effect that the chairman of the Executive Committee appoint three of its members to act as a subcommittee, they to add two members of their selection from the Society at large for the purpose of further studying Group Health Association, Inc., with a view of bringing back to the Executive Committee a solution concerning what the Society's attitude should be toward Group Health Association, Inc., and to report to the Executive Committee at its next regular meeting. A motion was made concerning the registered letter that was to be sent out."

That was to a list of organizations, groups and individuals. It was seconded and adopted.

By Mr. Leahy:

Q.—Doctor, I will ask you whether or not in pursuance of the motion which I have just read with reference to holding a special meeting of the Society, and the motion that there should be three members of the Executive Committee appointed to make a further study of the Group Health situation with reference to determining the attitude of the Society, whether or not they were adopted. A.—They were.

Q.—(Reading):

"It was also adopted that the fullest information in the hands of the Executive Committee be presented to the Society's membership at its special meeting on Thursday evening, July 29."

Doctor, I think you stated that on the 29th day of July that special meeting of the Medical Society was held. I will ask you to look at those minutes which I have just now shown you and see if you can identify those as the minutes of that special meeting. I have read this photostat copy recently and it sets forth the transactions of that meeting.

Mr. Leahy:—I am not going to repeat the report which I just read to you as the report of Dr. McGovern to the Executive Committee, which contains what he considered to be and stated as the known facts, some sixteen, which the committee at that time knew about G. H. A. The Executive Committee presented its report, and I am not going to reread that. Then there was discussion by Dr. Thompson, Dr. Hooe, Dr. Sprigg, and then Dr. McGovern was called upon to discuss the question. He stated:

"that he was the chairman of the subcommittee of the Executive Committee that investigated this matter thus far. He brought out the fact that the purpose of this meeting tonight was to inform the membership of the situation and to familiarize them with the facts obtained to date with an idea of turning it over in the minds of the membership and arriving at some conclusion as to how the Society should act in the matter. He felt that it was apparent from the report that the Group Health Association was not willing to 'come clean.' It was specifically stated that Mr. Penniman, its president, refused to comply in writing to an official communication addressed to him from the Society. In that letter four specific requests were made: that they submit copy of any contract they may have between the Group Health Association and the Home Owners Loan Corporation with the Federal Home Loan Bank Board; copy of their constitution and by-laws; and any contract that may be in existence in relation to the members of this corporation; and any other matter that would be of importance to the Medical Society. Dr. McGovern pointed out that the communication was sent by registered mail. Mr. Penniman called him by telephone asking that he have luncheon with him where these matters could be discussed. After consulting with officials of the Society Dr. McGovern accepted the invitation to meet Mr. Penniman at luncheon at the Raleigh Hotel. Dr. McGovern made it emphatic that he was not authorized to commit the Society in any way. Mr. Penniman was willing to give some of the information desired, but when asked for the contract between the Group Health Association and the Federal Home Loan Bank Board, he refused, stating that the Medical Society had no more right to ask for that than they would to go down to Garfinckel's department store and ask to see a contract that the store had with an express company, for instance. Dr. McGovern felt that it was definite that they had some kind of contract and they are not desirous that anybody should see it. In this connection he would add

that the American Medical Association, through Dr. W. C. Woodward, tried diligently, spending a whole day in the building of the Home Owners Loan Corporation, going from office to office, trying to get a glance at the contract, without success. Dr. McGovern felt that the contract itself did not interest the Medical Society as much as it did interest the A. M. A. If there is a connection between the Federal Home Loan Bank Board and the Group Health Association, and the Board is spending money, they are spending taxpayers' money which makes it a national entity. As far as the panel doctors are concerned, Mr. Penniman said he did not think it was appropriate for the Medical Society to have a list of the panel of physicians who have already been employed. He added that it is a well known fact that members of the Society have been approached. It also is a known fact that doctors have been asked to come in from the outside; that Dr. Brown has talked to them.

"Dr. McGovern said that property had already been leased for the housing of the clinic on I Street, between 13th and 14th streets. There was no doubt in his mind that the lay members of the board of directors of the Group Health Association are thoroughly convinced that they are doing a splendid thing for their employees. He was further convinced that they are not doing anything that might be considered unethical by them.

"Dr. McGovern called attention to an article which appeared in the *Evening Star*, in which it was announced that Senator Lewis had introduced a resolution in the Senate of the United States to provide medical care for the needy and the stricken with illness, etc."

I will not read the resolution which Dr. McGovern read, because it is not particularly interesting to us at this time. Dr. McGovern continued further with reference to Senator Lewis's speech at Atlantic City, N. J., at the convention, and Dr. Willson spoke, and then Dr. McGovern stated:

"that in the articles of incorporation they are going to give complete medical care and hospitalization. It would not be found out as to how they plan to do that. He pointed out that it is incorporated to include all Federal employees, except Army and Navy. He thought possibly they would have the free use of the local hospitals.

"At this point Dr. Charles R. Fierst, of Silver Spring, Md., addressed the Society."

"Dr. H. C. Macatee was recognized. He reiterated the plea of the chairman of the Executive Committee that if any members had ideas on this subject, or information about it, they should submit it to the committee for investigation. He said he would like to express his personal feeling about this matter, for whatever value it may have. He was of the opinion that the Medical Society should not take its attitude based on the idea that there are certain scurrilous people who are trying to do a scurrilous thing to the Medical Society and doing it in an underhanded, scheming way. It was his impression, gained from contact with certain individuals, that they are highly intelligent people who have profoundly studied this subject, who are aware of all the social currents flowing through the country with respect to the relation of the medical profession and the people. They are aware of what has been done elsewhere and the results. 'My feeling is that this is a group of responsible, honest, rather public-spirited people, who are undertaking to do something for the benefit of their associates in office. They are convinced and have secured what they call competent legal advice that they are on secure legal ground. They have by reason of their knowledge of similar projects elsewhere become convinced that wherever such organizations spring up they almost consistently receive the antagonism and the animosity of the local medical profession.'

"Dr. Macatee added that he was of the opinion that their desire to avoid publicity in this matter was due to their knowledge of that fact. So far as Dr. Henry Rolf Brown was concerned, Dr. Macatee stated that he has had a distinguished service in the Veterans Bureau, where he was highly esteemed. He was retired on account of age and feels that he is not old enough to be put on the shelf. Dr. Brown has been detached from the organized profession for a long time. He (Dr. Macatee) said he for one did not blame Dr. Brown for taking the position.

"Dr. Macatee, continuing, stated that they had evidently obtained advice from the *Twentieth Century Foundation* and are perfectly aware that similar organizations, such as the Endicott-Johnson Medical Service, which was fought tooth and nail by the County and New York State Medical Society; also the Ross-Loos Clinic of Los Angeles, which was likewise fought tooth and nail by the California organized medicine to the point that the members of that outfit were expelled from membership and then by court order were instated, were in operation. It was because of all these facts that the Executive Committee was recommended that this matter be recommitted for further study as to what will be wise for the membership as well as the public.

"Dr. Macatee added that there is now available a list of corporations and organizations and persons employing physicians in a contractual relationship, prepared under provisions of the constitution and by-laws. He urged the members to take the list and examine it carefully and familiarize themselves with its contents."

By Mr. Leahy:

Q.—Doctor, I want to show you on page 41, the first paragraph thereon, and ask you whether, so far as any knowledge you have is concerned, that is the first information of a Dr. Selders which came to the District Society or any of its members? A.—So far as I know, that is.

Mr. Leahy:—That is at the special meeting of July 29, 1937, when Dr. Charles H. Fierst, of Silver Spring, Md., addressed the Society:

"He said that last evening he overheard a conversation that took place in one of the drug stores in Silver Spring. A man represented himself as a surgeon of this organization and showed the clerk a list of instru-

ments and equipment procured for a clinic to be opened in the 'Evans Electrical Building.' This man told the drug store employee that any major surgery that would be done would be performed in the local hospitals of Washington. Minor surgery would be taken care of in the clinic. By inquiry of the employee of the drug store, Dr. Fierst stated he obtained the name of this man as Dr. Raymond H. Selders, 2445 15th Street N.W., Telephone Adams 5302; that he was formerly from Massachusetts. Dr. Selders applied for a courtesy card at the drug store."

Then there was further discussion by other members with reference to Dr. Macatee's remarks and Dr. McGovern's remarks, and at this point Dr. Sprigg reread the recommendation of the Executive Committee, as amended, as follows:

"That the chairman of the Executive Committee appoint three of its members to act as a subcommittee, they to add two members of their selection from the society at large, for the purpose of further studying the Group Health Association, Inc., with a view of bringing back to the Executive Committee a solution concerning what the society's attitude should be to the above Group Health Association, Inc., and to report to the Executive Committee, subject to the call of the chairman.
"Duly seconded and adopted."

By Mr. Leahy:

Q.—Doctor, did you happen to serve upon that committee which was appointed that evening? A.—Yes, sir.

Q.—Do you recall the composition of the committee? A.—I remember I was chairman of it and that Dr. Groover, I think, was one of the members added at large. Dr. McGovern was a member of it. The other personnel of it has escaped my memory.

Q.—Was there any other action taken by the District Medical Society which is not reported in any of the minutes of the meetings up to this date, July 29, 1937, other than the appointment of a subcommittee to study the matter? A.—None whatever.

Q.—How long did your committee function before you made another report, if you did? A.—The committee functioned from July 29 until its final report on Sept. 27, 1937.

Mr. Leahy:—May I approach the bench for just a moment, your Honor?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

TESTIMONY OF WILLIAM RICHARDS CASTLE

DIRECT EXAMINATION

By Mr. Leahy:

William Richards Castle said he has resided in Washington since 1918. He was first in the Red Cross for a year, and then in the State Department from the beginning of 1919 until 1933. He was head of the European Division for a while, and then was Assistant Secretary and finally Under-Secretary of State. He identified a letter which he had sent to the addressee.

TESTIMONY OF DR. HENRY C. MACATEE

DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

The witness identified minutes and said he had been on vacation from the first of August and returned just after Labor Day.

Mr. Leahy:—At the meeting of September 8, which was a special meeting of the Executive Committee, the secretary was called on to make a report in the absence of the chairman of the subcommittee, Dr. H. C. Macatee:

"It was stated that during Dr. Macatee's absence from the city during the month of August, owing to the clamor for action that had been set up by certain society members, it was incumbent upon the committee to hold a meeting. At a meeting which was held in the office of Dr. Thomas A. Groover, it was adopted that Drs. Macatee and McGovern be duly appointed by the Society at large as members of the subcommittee."

The following statement was made as the statement of the committee:

"1. That Group Health Association is unethical and that the participation in it by any member of the Medical Society of the District of Columbia would render him or her subject to disciplinary action by the Society.

"2. Your committee at this time has no definite recommendation to make with respect to combating the activities of Group Health Association other than as embodied by implication in the preceding paragraph.

"3. It is the opinion of your committee that the Medical Society of the District of Columbia should maintain close contact through the chairman of this committee with the American Medical Association in an effort to formulate a suitable and effective policy with respect to combating the activities of Group Health Association.

"It was explained that Dr. Macatee has been duly notified of the committee's activities during his absence and also that it was the desire of the committee to hold a meeting just previous to the meeting of the Executive Committee on this evening. Dr. Macatee had stated over the telephone that this afternoon was very well taken up and it would be impossible for him to be present.

"Upon motion duly seconded the Executive Committee unanimously accepted the report of the subcommittee."

Then Dr. McGovern was called on to speak, as well as other physicians, and then Dr. Macatee was recognized.

"He summed up briefly his stand in the matter, stating that before accepting the subcommittee appointment he definitely told Dr. Sprigg that he was going to be out of town for the whole month of August, and he thought that some one else should serve. Upon insistence he accepted. He was of the opinion that in view of the committee seeing fit to meet this evening and on other occasions during his absence, and having brought in a report without his presence, he should resign and that his resignation from the committee should be immediately accepted.

"Dr. Ruffin and others expressed the hope that Dr. Macatee would not deprive the Executive Committee and the Society of his services which were deemed most valuable in the revamping of the report which Dr. Sprigg and others thought should be in such a form as to be suitable to be sent to each member of the Society and Members of Congress as a dignified expression of organized medicine's stand in the protection of the health of the individual.

"Upon motion duly made and finally adopted the committee was to be continued with Dr. Macatee chairman and the report to be made back to the Executive Committee with a statement involving specifically the violations of the Code of Ethics and the reasons for opposition to the group plan on the basis of the health of the individuals who would be subscribers.

"That portion of Dr. Ruffin's proposal which would refer the matter back to the American Medical Association was stricken out.

"Dr. Macatee announced his willingness to continue and do anything within his power to aid the committee."

Then several doctors talked and further instructions were given with reference to other matters which I do not think are of interest here.

By Mr. Leahy:

Q.—Doctor, do you recall what occurred to the report which was submitted on the 8th day of September of a meeting at which you were not present? A.—Although it was adopted at that meeting, the whole matter was recommitted to the committee and it was superseded by another report which the subcommittee submitted to the Executive Committee on September 27.

Q.—That was the meeting, was it not, Doctor, which we were discussing just before I brought to your attention the September 8 meeting in the shape of minutes? A.—That is the meeting the record of which I identified.

Mr. Leahy:

"A regular meeting of the Executive Committee of the District of Columbia Medical Society held Monday, Sept. 27, 1937.

"The chairman at this point called on Dr. H. C. Macatee, Chairman of a subcommittee, to consider the Group Health Association, Inc., for a report. The report was read, Dr. Macatee stating that there had been two meetings of the committee and that the committee recommended the following for presentation to the membership:"

By Mr. Leahy:

Q.—Doctor, before I read this, may I ask you what relation had this report, which was your report, to the report of September 8 which I just read? A.—It was to be a final report of the committee upon recommitting the whole matter to that subcommittee and was to supersede and supplant the preliminary report made on September 8.

Q.—Did it so supersede and supplant the earlier report? A.—It did.

Mr. Leahy:—This is the report:

"At a special meeting of the Medical Society of the District of Columbia held July 29, 1937 the membership was advised of all the facts that the Executive Committee had been able to gather respecting the purposes, proposed methods, and progress of the Corporation composed of employees of the Home Owners Loan Corporation now in process of organization, the object of which is to provide complete medical, surgical and hospital care for its members and their dependents upon a prepayment plan of financial support through membership dues. The professional services offered by the Corporation are to be supplied by a full time salaried staff of medical and other technical employees. The name of the organization is Group Health Association, Inc., of the Home Owners Loan Corporation.

"The Executive Committee recommended at the special meeting that the Society authorize further study of the subject by the Committee in order to enable it to report suitable recommendations to the Society looking to the formal adoption of an official attitude toward this proposed new type of medical practice.

"Such an expression of the Society's attitude is necessary for the guidance of our membership, both with respect to possible employment by the corporation and with respect to professional relationships to its medical and technical employees when and if it shall have begun to function.

"The Executive Committee finds: First, that employment by or professional relations with the Group Health Association, Incorporated, on the part of our members would be conditional upon approval of the organization by the Society as required by Chapter IX, Article III, Section 2, of the Constitution; that no application has been made by any member or by the organization itself for such approval; and that consequently there has been no submission of the data required for approval to the Compensation, Contract and Industrial Medicine Committee of the Society.

"The Committee finds: Second, that the conditions of rendering the medical and surgical service offered by Group Health Association, Incorporated, as set forth in such written promulgations of the organization the Committee has been able to see and as indicated verbally by officers of the corporation, appear to be inconsistent with the criteria for an acceptable form of contract practice as set forth in Chapter III, Article VI, Section 3, of the Principles of Medical Ethics of the American Medical Association, by which we are obliged to be guided. In particular it would appear that at least two of the criteria would necessarily be violated, viz.: '1. Where there is solicitation of patients, directly or indirectly'; and '5. When free choice of a physician is prevented.' In the first instance, it is obvious that the solicitation of employees of the H. O. L. C. to take membership in Group Health Association, Incorporated, is an effort to entice many away from medical relationships already formed to the medical personnel of the corporation. This effort would raise the question whether a further criterion of an acceptable contract is violated, viz.: '4. When there is interference with reasonable competition in a community.'

"However, the criteria above quoted must be applied in the light of experience, and we are required by the same Principles of Ethics to exercise prudence in forming opinions: 'Judgment should not be obscured by immediate, temporary or local results.' In any form or instance of contract practice 'The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole.'

"The Executive Committee, therefore, recommends the adoption of the following:

"Resolved, That a final expression of the attitude of the Medical Society toward the acceptability of any cooperative medical service organization as an approved agency for the employment of members is manifestly impossible without the submission of all related data as a basis for approval, and manifestly undesirable when information is lacking as to whether any such group will ever become operative; and

"Resolved, That the membership be reminded of the requirements of Chapter IX, Article III, Section 2 of the Constitution for their guidance with respect to Group Health Association, Incorporated, of the H. O. L. C.; and

"Resolved, That the Medical Society recognizes a growing desire in Washington for some feasible plan of cooperative group medical service on a prepayment basis; that it recognizes the value of such an arrangement for many people of limited incomes; and that, having already provided a means in the Health Security Administration for the people without ready money to secure medical service on a postpayment plan, it is willing to collaborate with appropriate, responsible groups to devise methods for group prepaid medical service mutually acceptable to the two essential parties to such an agreement, viz.: the group needing and proposing to pay for the service and the group capable of furnishing it; and

"Resolved, That, if hereafter it shall appear necessary or desirable, the Board of Medical Supervisors of the District of Columbia be requested to determine, by judicial decision if necessary, whether the operation of Group Health Association, Incorporated, or any similar organization, is or will be in conformity with the Healing Arts Practice Act for the District of Columbia.

"Dr. Macatee, upon concluding reading, stated that THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION would publish in its issue of Oct. 2, 1937 a detailed analysis of the Group Health Association, Inc., pointing out weak points from a legal viewpoint. It began with the statement that Title 5, Chapter 5 of the District Code was taken advantage of, which had to do with the mutual welfare of individuals in organizations. It was clear that the Government was definitely embarking in the insurance business and that the check-off from the Government payroll would have all of the evil points that were included in check-off in the factories for union dues. The American Medical Association's statement would cover four or five pages in THE JOURNAL. It was emphasized that this material was not for release until September 29. Dr. Macatee stated that it was his view that despite this article appearing in THE JOURNAL, that there should be no hesitancy in adopting the report of the Subcommittee."

Mr. Leahy:—There was a great deal of discussion as you can see on many points. I am not going to read that.

By Mr. Leahy:

Q.—Doctor, was this report which you read finally adopted at the meeting? A.—It was adopted unanimously.

Q.—You mention in here, in your own report, Doctor, that having already provided a means "in the Health Security Administration": what was that? A.—That is the eleemosynary organization to which I referred the other day, with offices at 1823 L Street, which investigates applicants for medical charity and arranges for their hospitalization in clinics, and also provides a means by which they may pay their own way or budget out the expenses of their hospitalization after the services have been rendered.

Q.—Doctor, at the time you made this report to the Executive Committee on Sept. 27, 1937 what information, if any, Doctor, over and beyond what you already had a month previously with reference to G. H. A. had you? A.—Nothing that I remember.

Q.—What communication had you in any shape or form with any member of G. H. A.? A.—None whatsoever.

Q.—Or with any of its Board of Directors? A.—None at all.

Q.—Do you recall, Doctor, after the Executive Committee had adopted this report which you just rendered, had just rendered, on September 27, whether that report was ever presented at any meeting of the District Medical Society? A.—It was incorporated in a report of the Committee to the Society on its meeting on Oct. 6, 1937.

Q.—In between the special meeting of the District Medical Society on July 29, 1937, what other meeting of the District Medical Society, subsequent thereto, and prior to October 6, with relation to G. H. A., or anything connected with it, was held? A.—None.

Q.—I am now going to hand you a copy of the minutes of what purport to be a meeting held Oct. 6, 1937, and ask you if you can identify them. A.—Yes, this is a photostatic copy of the transaction for that time.

Mr. Leahy:

"Dr. Sprigg, continuing, stated that for the information of the membership he would report that the Executive Committee met four times during the summer for the purpose of studying questions of the organization which has been featured by the Home Owners Loan Corporation. He pointed out that officials of the American Medical Association lent their aid: Dr. W. C. Woodward, Director of the Bureau of Legal Medicine and Legislation, and Dr. R. G. Leland, Director of the Bureau of Medical Economics, discussed the matter before the subcommittee; and Dr. Olin West, Secretary, discussed the matter with certain members of the Society. All discussing this question were thoroughly opposed to the plan as presented in toto."

And the following resolutions are the results of these deliberations concerning Group Health Association, Inc. And then follows this same resolution which I have read to you. I am not going to take time to read it. Then, upon motion duly seconded, and adopted, the recommendations of the Executive Committee were considered *seriatim*.

"Dr. Thomas A. Groover was recognized. He stated that if there was no objection he would like to introduce a substitute for the foregoing resolutions. No objections were made. He presented the following:

"WHEREAS, The Bureau of Legal Medicine and Legislation of the American Medical Association has prepared and published a comprehensive report on the activities of Group Health Association, Incorporated; and

"WHEREAS, The Medical Society of the District of Columbia is in full accord with the content of said report, both as to the established facts set forth therein and the implications drawn therefrom; therefore, be it

"Resolved, That the Medical Society of the District of Columbia cause a copy of said report to be sent to each of its members as an indication of its future policies with respect to combating the activities of said Group Health Association and also with respect to the ethical responsibilities of the Medical Society of the District of Columbia and of its individual members.

"Dr. Groover moved the adoption of these substitute resolutions. Seconded by Dr. F. X. McGovern.

"In discussion of the subject, Dr. Groover stated he wished to briefly state some of his reasons for proposing these substitute resolutions. He said:

"I wish briefly to state some of my reasons for proposing these substitute resolutions.

"I have grave doubts if this Medical Society alone can do a great deal toward combating Group Health Association, Incorporated, and believe that the most effective assistance and support it can invoke is that of the American Medical Association.

"The A. M. A. has manifested a keen interest in this problem and in the October 2 issue of THE JOURNAL has caused to be published a comprehensive survey of it which I trust many of you have read carefully.

"If you have, you must have noted that there are three dominant notes that run through it—the first being that Group Health Association is illegal; the second, that Group Health Association is unethical; and third, that the operation of Group Health Association would be inimical to the best interests of the medical profession and the public.

"As to the illegality of Group Health Association I am not personally qualified to speak, but I happen to know that the A. M. A. has made a careful study of this aspect of the question and it is their opinion that it is illegal. It would seem out of place at this time for this Society to commit itself to any plan of procedure such as that recommended by the Executive Committee in the event that legal action against Group Health Association is undertaken later. Obviously any plan of procedure should be contingent upon the advice of counsel.

"As to the ethical responsibilities of the Medical Society of the District of Columbia and its members the conclusion to be drawn from the A. M. A. report is inescapable. It says: "Physicians who sell their services to an organization like Group Health Association for resale to patients are certain to lose professional status." In contrast to this clear-cut statement the statements in the Executive Committee report are equivocal and quibbling for which I can find no justifiable excuse. The members of this Society I believe have a right to expect a definite unequivocal expression from the Society as to their ethical responsibilities which is lacking in the Executive Committee report.

"Finally it is the collective opinion of organized medicine that prepayment plans for medical care except under very special conditions are inimical to the best interests of the medical profession and the public. The quasi endorsement of any prepayment plan for a community like Washington as contained in the Executive Committee report might well alienate the support of the A. M. A. and prove disastrous to its influence and leadership. For these and other reasons which I will not go into I believe that any such commitment by this Society might very well prove to be exceedingly embarrassing."

Then follow talks by many, many people for pages and pages, which I will not take up with you, and then they go into other matters for perhaps forty to fifty pages.

Mr. Kelleher:—You want the action of the Society.

Mr. Leahy:—I was just going to ask that.

By Mr. Leahy:

Q.—Doctor, what was the action of the Society with reference to the report which the Executive Committee made at the meeting of October 6, and the report which was offered as a substitute by Dr. Groover? *A.*—I wasn't present at that meeting. My information was that Dr. Groover's substitute resolution was adopted.

Q.—And following that, what became of the subcommittee which had been appointed in the early part of the summer and of which you were chairman? *A.*—Its duties having been completed, it ceased to exist.

Q.—Up to Oct. 6, 1937 had the District Medical Society taken any other action than is indicated in the minutes which I have just brought to your attention? *A.*—None whatsoever.

Q.—Up to the meeting of Oct. 6, 1937 what expression of an attitude of the Society had ever been adopted? *A.*—On June 1 the Executive Committee authorized the appointment of a subcommittee to find out facts; on June 24 a meeting with the officers of Group Health Association was held at the Medical Society building to elicit facts; on July 26 a further meeting was had with the Board of Trustees of Group Health Association for further conference in the hope of reaching some accord with them. On July 29 all the facts obtained were submitted to the Medical Society at a special meeting, and the only action taken was the appointment of another committee to formulate a policy for the Society to adopt officially; on October 6 the Medical Society did adopt a policy as contained in the resolution presented by Dr. Groover. Those were the only actions taken by the Medical Society between those dates.

Mr. Leahy:—I should like to draw the attention of the jury to one statement which is made on page 4 of the minutes of the meeting of October 6, wherein after Dr. R. Arthur Hooe had been recognized he said:

"He referred to the constitution of the Society, as mentioned in Dr. Macatee's resolution, stating that there is a provision therein which makes it utterly impossible for a member of this society to engage with any corporation, group or individual without first submitting its verbal or written contract to the Compensation, Contract and Industrial Medicine Committee. He said when this fact was disclosed to the Group Health Association officials, their verbal reply was 'if that makes it impossible, if it is in violation of the ethics of the American Medical Association and your ethics, then why don't you and the American Medical Association change your ethics.'"

"Dr. Hooe said the reply naturally was: 'Because you haven't sufficiently convinced us that we should change them with any good reason.'"

Mr. Leahy:—And then there was a long speech by Dr. Horvath, with which Dr. Hooe said he was in accord.

By Mr. Leahy:

Q.—Now, Doctor, do you recall whether following the meeting of October 6, and the adoption of this particular report of Dr. Groover, anything further was done in reference to Group Health Association during that month of October 1937? *A.*—I know of nothing, sir.

Q.—I am going to show you the meeting of Oct. 11, 1937 of the Executive Committee, sitting in a special meeting, and ask you whether anything appears therein as to what the Executive Committee recommended for further action. *A.*—Yes, that exhibit which you place before me is a record of that special meeting of the Executive Committee.

Q.—Do you know independently: have you any independent recollection now as to whether you attended that meeting or not? *A.*—I just referred to the list of those attending and I find myself listed.

Q.—Have you any independent recollection now, aside from the abstract as recorded there as to what occurred at the meeting? *A.*—No, sir.

Mr. Leahy:—This is March 11, 1937 special meeting of the Executive Committee of the Medical Society:

"The recommendation was finally adopted that the American Medical Association authorities be communicated with and they be asked to send to the Insurance Commissioners, the Commission on Licensure, the District of Columbia Commissioners, the United States District Attorney for the District of Columbia, and the Corporation Counsel, substances of the article that appeared in the Oct. 2, 1937 issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION (ORGANIZATION SECTION, p. 39B), and that if the American Medical Association refused or would not comply, then the Secretary send a reprint of said article to each of these officials."

By Mr. Leahy:

Q.—Do you recall whether any further action was taken by either the Executive Committee or the Society with reference to determining the question involved in the recommendation just read? *A.*—How does your question go?

Q.—Do you recall anything further was done in pursuance of the recommendation which Dr. John A. Reed, at this point, as stated in the minutes, was requesting: "He stated that in his opinion the American Medical Association should follow through and duly notify the District Attorney, Corporation Counsel, and other legal officials of the apparent violation of law of Group Health Association, Inc., would violate when and if they start to operate"? *A.*—I recollect no further action.

Q.—I am going to show you now the special meeting of the District Medical Society proceedings as reported in its minutes of Oct. 15, 1937 and I will ask you if there was any action taken at that particular meeting with reference to anything concerning G. H. A.

Mr. Lewin:—Was this witness present?

By Mr. Leahy:

Q.—Were you in the meeting? "Other members to the number of about a hundred and fifty-five." *A.*—My impression is that I was not at that meeting.

Q.—At this particular meeting, according to the minutes which I am not going to read—because they deal with so many other matters, and so many doctors spoke—Dr. Wall, Dr. Sprigg, Dr. Jansen, Dr. Conklin, Dr. Hooe, Dr. Jacobs, Dr. Kirby, Dr. Holden, Dr. Hagner, Dr. Riddick, Dr. Davis, Dr. Sager, Dr. Chase, Dr. Christie, Dr. McLean, Dr. Parker, Dr. Alfaro, Dr. Templeton, Dr. Hooe, Dr. Groover—until we come down to the seventh page of the minutes:

"Dr. W. M. Sprigg asked consent to read a letter addressed to the Boards of Directors of the various hospitals in the city. Consent was granted."

That letter is dated October 15. He read the letter. He called attention to Chapter IX, Article 4, Section 1. The result of the action as to sending the letter was that the matter was held over, as I recall.

Mr. Lewin:—Mr. Leahy, didn't he also refer to Section 5?

Mr. Leahy:—Did he?

Mr. Lewin:—Didn't he start out with Section 5 and quote it?

Mr. Leahy:

"The Medical Society of the District of Columbia desires to call your attention to Chapter IX, Article IV, Section 5 of the Constitution, as follows,"

quoting it; and that matter was held over for further discussion. This was at the meeting of Oct. 15, 1937.

By Mr. Leahy:

Q.—Doctor, have you any independent recollection now as to this letter which has just been brought to the jurors' attention? *A.*—None.

Q.—Do you recall whether you were present at the meeting of November 3 of the District Medical Society? *A.*—May I see the photostat?

Q.—Yes. It says "Other members present about one hundred and sixty." *A.*—I think I was not present at that meeting.

Mr. Leahy:—This is November 3. There are many things in here which have no relation whatsoever to the matter at hand. On the bottom of page 2, however, Dr. Sprigg, the chairman of the Executive Committee, was recognized. He presented the following recommendation from the Executive Committee, which is the one I just drew your attention to, to the effect that the American Medical Association authorities be communicated with and asked to send to the various public officials of the District of Columbia substances of the article which appeared in the Oct. 2, 1937 issue of THE JOURNAL. Dr. Sprigg made the motion that the recommendation as read be adopted. No. 1 I have just brought to your attention. Second, Dr. William J. Stanton was then recognized and he offered a substitute for the recommendation of the Executive Committee. Now, that is a long resolution and inasmuch as it was not adopted I will not take your time to read it.

Motion was made that the foregoing resolution be adopted, and it was seconded. Then there follows a long discussion between Dr. Stanton, Dr. Sprigg, Dr. Smith—

Mr. Lewin (interposing):—Excuse me. I would like to object to the reading of these minutes at this time. The witness has testified he was not present, so I do not see how it could form a basis for any examination of this witness.

Mr. Leahy:—I haven't asked the witness any questions about it.

THE COURT:—He may read from the minutes at any time.

Mr. Leahy:—Then, Dr. Sprigg offered a resolution:

"Resolved, That the Executive Committee of the Medical Society of the District of Columbia is hereby authorized and directed to take such steps as may be necessary, first, through the American Medical Association and if that fails, second, through its own initiative to inaugurate a program of information through the state medical associations and other sources of the dangers of lowering the standards of medical care to be given government employees in the Home Owners Loan Corporation organization and other government agencies as found in the rules of the Group Health Association, Inc., and many other reasons why it is contrary to sound public policy."

Then follows another discussion between Dr. Sprigg, Dr. Stanton, Dr. Prentiss Willson, Dr. Hooe, Dr. Caulfield, Dr. McLeod, Dr. Wilkinson, Dr. Sager, Dr. Christie, Dr. Ruffin, Dr. Stanton again, and Dr. Willson's motion was finally adopted. That motion was that a committee should be appointed to retire to draw up a resolution. The committee appointed was Dr. Stanton, Dr. Ruffin and Dr. McGovern.

"Later in the evening Dr. Stanton made the following report of the committees's deliberations, presenting the resolutions:

"That the President of the Medical Society of the District of Columbia appoint a committee of two members to go to Chicago as promptly as practicable and lay before the proper officials of the American Medical Association the views of this Society with regard to the activities of Group Health Association, Incorporated, including:

"1. That inasmuch as the movement threatens to be nationwide in its scope and affects every component organization of the American Medical Association, it is the duty of the American Medical Association to oppose immediately with all its might this entering and possibly illegal wedge to the socialization of medicine.

"2. That in view of the tremendous import of the Group Health Association movement to the membership of the Medical Society of the District of Columbia and also to the profession at large and to the public, it is the opinion of the Medical Society of the District of Columbia that it is the duty of the American Medical Association to combat vigorously Group Health Association, Incorporated.

"3. That the Medical Society of the District of Columbia waives any question of regional interference by the American Medical Association.

"4. That the American Medical Association give a definite and immediate expression of its intended action in this matter.

"Upon motion, duly seconded, the foregoing resolutions submitted by the special committee were adopted."

By Mr. Leahy:

Q.—Doctor, do you recall whether there was any other action taken to your knowledge by the District Medical Society other than this which authorized the going to Chicago of Drs. McGovern and Hooe to see the American Medical Association?

Mr. Kelleher:—He was not at the meeting: let's get what the minutes show followed.

Mr. Leahy:—I am not talking about anything else at this point.

The Witness:—None.

Mr. Leahy. Now, at that same meeting of Nov. 3, 1937 there was another resolution adopted which I wish to draw the attention of the jury to. Oh, there were many offered; much talk—until we come down to the twelfth page.

"Dr. Prentiss Willson would inquire if the foregoing was in lieu of the recommendation concerning the sending of a letter to the Board of Directors and medical staffs of the local hospitals, as published through the membership on the agenda."

That is the Dr. Sprigg letter I called attention to at the earlier meeting.

"He said he intended to move a substitute motion for the letter which appeared on the agenda. If the Society approved the motion proposed by Dr. Sprigg it would be inexpedient to send the letter out at the present time. He was of the opinion that the Hospital Committee, composed of members of the Society serving on hospital staffs in Washington would be a more suitable committee to handle the matter. He offered the following substitute:

"WHEREAS, The Medical Society of the District of Columbia has an apparent means of hindering the successful operation of Group Health Association, Inc., if it can prevent patients of physicians in its employ being received in the local private hospitals; and

"WHEREAS, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as determined by their lay boards of directors, except through its control of its own members serving on their medical staffs, and

"WHEREAS, Conflicts between the Medical Society of the District of Columbia and any local hospitals arising from an attempt to enforce the provisions of Chapter IX, Article IV, Section 5, of its Constitution should be assiduously avoided, if possible, because of the unfavorable publicity that would accrue to its own members; therefore, be it

"Resolved, That the Hospital Committee be, and is hereby, directed to give careful study and consideration to all phases of this subject and report back to the Society, at the earliest practicable date, its recommendations as to the best way of bringing this question to the attention of the medical boards and boards of directors of the various local hospitals in such a manner as to insure the maximum amount of practical accomplishment with the minimum amount of friction and conflict."

Mr. Leahy:—This is afterward adopted; the minutes show it was adopted, and the matter referred to the Hospital Committee.

By Mr. Leahy:

Q.—Doctor, did you have any membership on the Hospital Committee whatever? *A*.—No, sir.

Q.—The Sprigg letter which this resolution was presented in order to supplant, do you recall whether that was ever sent? *A*.—I know, but I do not know how; I know it was not sent.

Q.—Do you know it was not sent; I thought perhaps you had read these minutes? *A*.—I have read the minutes over and the Willson resolution stopped it.

Q.—Do you recall or have you any knowledge yourself personally whether this Willson resolution did go to the Hospital Committee? *A*.—I have no personal knowledge of that.

Q.—Have you any personal knowledge as to whether any action of any kind was ever taken on the Willson resolution? *A*.—Only from reading of the minutes that the Willson resolution was adopted, and the Sprigg letter was not sent.

By Mr. Leahy:

Q.—Doctor, as read, the resolution proposed by Dr. Prentiss Willson stated:

"WHEREAS, The Medical Society of the District of Columbia has no direct control over the policies of such hospitals as determined by their lay board of directors, except through its control of its own members serving on their medical staff:"

May I ask you, Doctor, how long have you been connected with the hospitals in the District of Columbia? *A*.—Through-out my full medical career.

Q.—Over how many years does that extend? *A*.—Forty-one.

Q.—As a matter of fact what control has the Medical Society over the hospitals of the District of Columbia?

Mr. Lewin:—Objected to as calling for a conclusion.

THE COURT:—Well, he may state whether or not there is any understanding or agreement between them which gives the Society that control: Is that what you mean?

The witness referred to incidents which had occurred in 1905, 1920 and 1922.

By Mr. Leahy:

Q.—And following those incidents do you recall that the Medical Society itself or through any of its committees ever tried to control the hospitals?

Mr. Lewin:—Objected to as calling for a conclusion.

Mr. Leahy:—That is not asking for a conclusion. I am asking whether through any contract, understanding or agreement the Medical Society ever pretended to control the District of Columbia Hospitals.

THE COURT:—He may answer that.

The Witness:—None whatever, because—

Mr. Lewin:—Objected to. It has been answered.

THE COURT:—Yes, I think that is sufficient.

By Mr. Leahy:

Q.—What was the attitude or the knowledge of the District Medical Society with reference to its ability to control hospitals in the District of Columbia?

Mr. Lewin:—That is objected to.

THE COURT:—Through his own experience?

Mr. Leahy:—Yes.

The Witness:—Will you read the question?

By Mr. Leahy:

Q.—What knowledge had the District of Columbia Medical Society, through its own experience, as to its ability to control hospitals in the District of Columbia?

Mr. Lewin:—Objected to.

THE COURT:—I think that would call for an exposition of these incidents and occasions.

Mr. Leahy:—Yes, but if they learned from those occasions of their ability or inability: that is what I am asking him.

THE COURT:—They are rather remote.

Mr. Leahy:—But if they affected the conduct of the District Medical Society down through the years.

THE COURT:—He said 1922.

Mr. Leahy:—Yes, and he said they have never tried since then.

THE COURT:—I wouldn't want the situation to develop where we would have to try out those experiences.

Mr. Leahy:—Oh, no, your Honor, I wouldn't either.

THE COURT:—He has stated that the Society had these experiences at that time and to his knowledge it has not since

attempted to exercise control over the hospitals. It seems to me that is about as far as we can go without going into the matter which would open up the details of the specific incidents.

By Mr. Leahy:

Q.—Have you any knowledge now of any acts done by the District Medical Society in any attempt to control the policies of any hospital in the District of Columbia, other than what is disclosed in the minutes of the meetings of the District Society, as read?

Mr. Lewin:—Objected to as leading, and calling for a conclusion.

Mr. Leahy:—No, I am not calling for any conclusion; I am asking if they didn't disclose every action that was taken by the Society, so far as his knowledge goes.

THE COURT:—He may answer that.

The Witness:—Nothing was done by the Medical Society other than as disclosed by the minutes.

By Mr. Leahy:

Q.—Do you recall whether at any time any action was taken by the District Medical Society in any way, shape or manner to prevent patients of physicians in its employ—re-referring to Group Health Association—being received in local private hospitals?

Mr. Lewin:—Objected to; the minutes speak for themselves.

THE COURT:—You mean any formal action, or any action other than is disclosed in the minutes?

Mr. Leahy:—Yes.

Mr. Lewin:—I think he has already testified to that.

THE COURT:—He may answer that generally.

The Witness:—The Medical Society never on any occasion undertook to do anything to interfere with the reception by the local hospitals of patients arising from the G. H. A. group.

By Mr. Leahy:

Q.—Now, I think you stated earlier that in your own experience you have been connected for some years with Garfield Hospital? *A.*—Yes.

Q.—I have forgotten just how long: will you refresh our memories on that? *A.*—I was an intern there between 1900 and 1901; I was a frequent attendant on private patients for years thereafter; and then I became an attending physician at Garfield. I am now a member of the Board of Directors and President of the Medical Staff.

Q.—Doctor, does Garfield Hospital have a rule that only those who have been given privileges can exercise and practice their profession within the hospital? *A.*—It does.

Q.—Do you recall how long that rule has been in effect? *A.*—Ever since I have been connected with it in a staff capacity.

Q.—Do you recall whether that same rule is in effect within the other private hospitals in the District of Columbia?

Mr. Lewin:—Objected to.

THE COURT:—So far as he knows from experience he may answer.

The Witness:—That is true, because I am admitted to courtesy privileges in the other hospitals annually.

By Mr. Leahy:

Q.—In the exercise of its judgment as to those who shall enjoy courtesy staff privileges at Garfield, on what does the judgment of the hospital depend as to whether the privileges shall be extended or not?

Mr. Lewin:—Objected to as calling for a conclusion, and because the minutes of the hospital are the best evidence.

THE COURT:—You say you are a member of the Board of Directors, and President of the Medical Staff?

The Witness:—I am.

THE COURT:—I think he may outline the general considerations that apply as to the policy of the hospital.

The Witness:—There is required a formal application by any physician who desires courtesy privileges. The formal application must state the physician's name, his address, the place and scope of his education, his postgraduate training, his special aptitude. It must contain the names of those who know personally of his professional attainments in the way of endorsers. Upon receipt by the superintendent of the hospital of that it is referred to that section of the medical staff involved in the type of practice in which he desires courtesy privileges. For instance, if he desires privileges in general surgery, the application is referred to the attending surgical staff. Upon their opinion is based the answer whether or not they endorse the application. It is a rule that their endorsement must appear. All of the members of the attending staff must endorse the application. It then comes to the advisory committee, of which I am chairman; whereupon these facts are

considered; where it is determined whether further endorsements might be necessary or desirable and, after all the information has been obtained the advisory committee recommends to the Board of Directors the appointment to the courtesy staff of this applicant, or not; whereupon the Board of Directors takes its own independent action with regard thereto.

By Mr. Leahy:

Q.—Ultimately then the appointment to professional privileges depends upon the Board of Directors? *A.*—Entirely.

Q.—Doctor, in the determination as to the right to courtesy privileges, what, if anything, does membership in a local medical society mean as affecting the question of his right to membership on the courtesy staff? *A.*—That depends on the regulations, as adopted by the individual hospitals concerned.

Q.—With reference to Garfield, what effect has membership in the local society upon the qualification or right to become a member of the courtesy staff?

Mr. Lewin:—Will you fix the time?

By Mr. Leahy:

Q.—From January 1937 to Dec. 20, 1938.

A.—During that time there has been no change in the policy of the hospital, but the fact that the applicant is a member of the medical society stands as a substantial bit of evidence with regard to his acceptability, but his nonmembership is not a bar in Garfield Hospital.

Q.—And as a matter of fact are there others than those who are members of the local medical society on the staff, and were there at that time? *A.*—Yes, there were.

By Mr. Leahy:

Q.—Do you recall whether, while you were at Garfield Hospital, Dr. Raymond E. Selders made any application for privileges at the hospital? *A.*—I do.

Q.—Do you recall when it was that he made application for privileges? *A.*—My recollection is it was shortly after Group Health Association came into operation, which was fixed about November or December 1937.

Q.—And will you kindly tell us what route that application took in so far as Dr. Selders was concerned, and whether it took any route different from any application by any other doctor? *A.*—None whatever.

Q.—What was finally done with Dr. Selders' application? *A.*—He was given temporary privileges under the rule that an applicant would be given temporary privileges pending action on his application, and his application finally was denied by the Board of Directors.

Q.—Over what period of time does this rule permit temporary privileges to be exercised? *A.*—Until the meetings necessary to go into the application and pass on it are held.

Q.—In granting Dr. Selders privileges during the period while his application was under consideration at Garfield Hospital, were you or were you not following the general rule as applied to all applicants? *A.*—We were.

Q.—Do you recall now when it was that the Board met finally to determine whether privileges should be granted to Dr. Selders? *A.*—I think it was in the spring of 1938.

Q.—Have you any recollection now as to about what time in the spring that occurred? *A.*—Yes.

Q.—When was it? *A.*—According to the best recollection I have it was in March 1938.

Mr. Lewin:—The records are already in evidence, showing when that was. May they be referred to? January 25 is when the temporary privileges were withdrawn.

Mr. Leahy:—I know that. I am talking about March. I want particularly that interoffice communication—run-of-the-mill case.

By Mr. Leahy:

Q.—Doctor, there came a time when the temporary privileges of Dr. Selders were withdrawn? *A.*—Yes.

Q.—You have heard the day just fixed. I think you will remember it, Jan. 25, 1938. *A.*—Yes.

Q.—Do you recall the occasion for the withdrawal of those privileges? *A.*—I know that there was a report from the surgical staff.

Mr. Lewin:—Objected to: you were simply asked whether you recalled it, Doctor.

The Witness:—I don't recall it in detail.

By Mr. Leahy:

Q.—Do you recall generally the occasion for the withdrawal, without stating the contents of any report, or anything of that kind? *A.*—It must have been on official action about Jan. 25, 1938.

Q.—In connection with the application of Dr. Selders at Garfield, do you recall an interoffice communication from Dr. Eisenman of Dec. 3, 1938 in which attention is called, I think, to the medical staff. Well, we will get it in a minute, so we will be sure about it. I show you a copy of it. It is dated Dec. 3, 1937. I will ask you whether or not that particular interoffice communication came for consideration of the committee of the staff of which you are a member. A.—The letter has come to my attention since that date. I know nothing of its origin.

Q.—And you never saw it or about the time it was written? A.—I did not.

Q.—I now show you a letter dated March 28, 1938, I believe it has been introduced in evidence. It is 487, and ask you if you recall the letter or the facts contained therein? A.—That letter set forth—

Mr. Lewin:—Objected to as not responsive.

By Mr. Leahy:

Q.—Do you recall the contents of the letter? A.—No.

Q.—Do you recall whether any action was taken at or about the date of March 28, 1938? A.—Yes. Action was taken by the board of directors at a meeting at which I was present.

Q.—I will ask you whether or not the letter correctly sets forth what that action was? A.—That sets forth accurately the action taken.

Q.—Who was on the medical staff on Dec. 28, 1937, Doctor? Do you recall?

THE COURT:—That was a pretty large staff, was it not?

By Mr. Leahy:

Q.—Was that a large staff? A.—A very large staff; yes.

Q.—Were you present at the meeting of December 28, at the executive meeting of the staff, when the action which is set forth was taken? A.—This was a meeting of the Executive Committee of the board of directors, and my recollection is that I was present.

Q.—Is it your recollection now that that truly reflects the action of the Executive Committee? A.—It does.

Q.—And also that so much as is quoted truly reflects the official action of the board of directors on March 22, 1938? A.—It does.

Mr. Leahy:—The letter is U. S. Exhibit 487, dated Dec. 28, 1937 from Dr. Eisenman, Superintendent, to Mr. Aspinwall, and it says:

"That pending the settlement of the question as to the ethical status of Group Health Association, Inc., and pending further study of the professional qualifications of Dr. Raymond E. Selders that he be not accorded courtesy privileges at Garfield Memorial Hospital except, of course, in a real emergency."

That is the meeting of the board of directors of March 22, 1938:

"The president, in reviewing the proceedings, stated:

"Our final connection with Group Health Association was the application of Dr. Selders for surgical privileges. The temporary privilege awaiting action on the application and the withdrawal of these privileges on recommendation of the Medical Staff as noted in the resolution of the Executive Committee meeting on Dec. 28, 1937 awaiting legality of Group Health Association. The actual disqualification of Dr. Selders' application was by the board of directors at meeting on Jan. 25, 1938, in which the minutes of the Executive Committee meeting of Dec. 28, 1937 were read.

"In approving these minutes the board desires to state that in denying privileges to the courtesy staff of the hospital to Dr. Raymond E. Selders on the recommendation of the Medical Staff of the Hospital the action was pending the legality of the organization who employed Dr. Selders."

By Mr. Leahy:

Q.—Could you tell us about how many are on the Medical Staff at Garfield Hospital? A.—That question is difficult to answer, because the staff is divided up into different categories.

Q.—Can you approximate the number? A.—I do not know whether you are referring to the Medical Staff in general or the particular part of it which had to do with recommendations in the case of Dr. Selders.

Q.—How many would compose that part of the Medical Staff who had to do with the application of Dr. Selders? A.—Four.

Q.—Who were they? A.—Dr. H. H. Kerr, Dr. Charles S. White, Dr. F. X. McGovern and, I think at that time Dr. Howard F. Strine.

Q.—Following the application in the fall of 1937 do you recall a renewed application made some time in July of 1938, following Mr. Justice Bailey's decision, for privileges of Dr. Selders at the hospital? A.—I have no independent recollection of that, sir.

Q.—I am going to show you now, Doctor, what was identified this morning as Defendants' Exhibit for identification No. 42. I want you to see that letter and ask you if that had come to

your attention as a member of the Executive Staff? A.—That came to my attention as a member of the Board of Directors.

Q.—As a member of the Board of Directors of the hospital? A.—That letter did come to my attention in that way.

Q.—Do you recall whether or not Dr. Selders was ever accorded privileges at Garfield Hospital? A.—Only temporary privileges until his application was denied officially.

Q.—What effect, if any at all, did this letter which I have just submitted to you for your perusal have upon the board of directors' determination with reference to whether he was qualified for privileges or not?

Mr. Lewin:—Objected to, because the date of the letter is after the action of the board, as just testified.

THE COURT:—Let me see that letter, please.

(The letter referred to was handed to the court.)

Mr. Lewin:—When the letter is offered I will have other objections.

THE COURT:—Come to the bench, please.

(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

(The discussion concerned the admissibility of the Castle letter and the Court ruled it admissible.)

Mr. Leahy:—Will you kindly read the question, Mr. Reporter? (The pending question was read by the reporter as follows:)

"Q.—What effect, if any at all, did this letter which I have just submitted to you for your perusal have upon the board of directors' determination with reference to whether he was qualified for privileges or not?"

The Witness:—It had a definitely adverse effect.

Q.—Is the W. R. Castle whose name appears on the top of this letterhead the same William R. Castle whose name appears in Government Exhibit 481 as a member of the board of directors? A.—Yes, sir.

Q.—Of Garfield Hospital? A.—Of Garfield Memorial Hospital.

Q.—Do you recall whether the board of directors had taken any action by way of requesting Mr. Castle to get this information? A.—My recollection is that it was an independent action on his part.

DEFENDANTS' EXHIBIT 42

Mr. Leahy:—This is on the stationery of W. R. Castle. It is dated March 30, 1938, and addressed to Dr. Francis J. Eisenman, Garfield Hospital:

"My Dear Dr. Eisenman:

"I wrote as I told you I would to Mr. Aldus Higgins in Worcester. He is the president of the Norton Company, is connected with various hospitals, and is, I believe, head of the Worcester Museum. Mr. Higgins is a very careful individual who would not write anything which he had not checked on pretty carefully. This is what he said:

"Dr. Selders was a surgical resident at Worcester City Hospital for one year, two years ago, at a salary of \$900 and keep. We understood that he had graduated from a medical school in Oklahoma, had been in practice about seven years, and part of the time in Houston, Texas, where he had a hospital staff appointment. He then came to Pennsylvania State Medical School to their P. G. course which requires one year at the school and one year of practical experience as a resident. His year at the hospital was a part of this procedure. His work at the City Hospital did not meet with the approval of the Superintendent as to the way he handled himself with interns, nor the approval of the surgical staff as to his accomplishments as a surgeon. The appointment accordingly was not continued after the first year.

"Our superintendent has a letter from one who claims to be his sister living in the South with the statement that she made sacrifices to educate Dr. Selders and that recently when she had turned to him for aid in her financial circumstances he had informed her that he did not care to hear from her again."

"Mr. Higgins adds that it is quite possible he may be able to get some more detailed information by consulting the doctors who knew him. He says, however, that it seems as though the above, for the accuracy of which he vouches, would be bad enough to dispose of him both as a surgeon and a man.

"If you would like me, however, to write Mr. Higgins and ask him to make further inquiries, I shall of course be glad to do so. We ought to realize, however, that if that is done and Mr. Higgins consults various people, the inquiries are likely to be known.

"Very sincerely,

"William R. Castle."

There was extended discussion on an action taken by the hospital following the Tew case.

Q.—What did you do with reference to the paper which you have just seen here? A.—I prepared it and presented it to the staff.

DEFENDANTS' EXHIBIT 43

Mr. Leahy:

"Regulation governing admission of patients to Garfield Memorial Hospital upon the application of physicians and surgeons not members of the courtesy staff.

"The word 'emergency' is defined for the purpose of the use of the facilities of the hospital by physicians and surgeons not admitted to the courtesy staff of the hospital as some condition in which the life or safety of the patient is in danger except for some immediate intervention by the physician involved in the way of first aid, as in the case of hemorrhage, asphyxiation, or the like. In cases in which there is time for the formal posting of an operation the hospital holds that there is also time to secure the services of a surgeon who had been granted surgical privileges at the hospital, and that course of action will hereafter be required upon application for the admission of any patient by a physician or surgeon not of the courtesy staff.

"Under the conditions stipulated members of Group Health Association will be admitted to the hospital just as any other person is admitted, subject to available space and the suitability of the patient in other respects.

"Unanimously adopted by the Executive Staff at a special meeting held March 25, 1938."

It is signed "H. C. Macatee, M. D., President, Medical Staff," and it says that the original was sent to Mr. Aspinwall on the 25th day of March 1938.

By Mr. Leahy:

Q.—Who is Mr. Aspinwall? A.—President of the Board of Directors.

Q.—What was the occasion of your defining the word "emergency" in the manner in which I have just read? A.—The occasion was the admission to the hospital of a G. H. A. patient named Miss Tew, upon the statement of Dr. Selders that it was an emergency case. The staff of the hospital took the position that it was not an emergency case; and it was to make the position of the hospital officially known to all concerned in such cases, so that no question would arise thereafter, that this resolution was devised and adopted.

Q.—Under the rule of Garfield Hospital could one who did not enjoy courtesy privileges treat an emergency case, notwithstanding, in that hospital? A.—Certainly.

Q.—And then it was to define and make clear what such an emergency case was that this was made known? A.—Exactly.

Q.—And under the definition as just outlined, following that was Dr. Selders still qualified to treat an emergency case at Garfield Hospital? A.—If it was an emergency under the stipulation.

Q.—Do you recall whether, after Justice Bailey's decision, Garfield Hospital received any applications for courtesy privileges by any of the G. H. A. staff members? A.—I do.

Q.—Do you recall how many, now, did so apply? A.—I recall two applications which were considered in December 1938.

Q.—Do you recall how promptly consideration was given to those applications after their receipt by the hospital?

Mr. Lewin:—Objected to. I think there must be records that show this.

THE COURT:—There may be records, but that does not preclude the circumstances being shown by him. I think if it were a matter in which you were attempting to impose a contractual obligation upon the hospital the records would be the best evidence, but I think that for ordinary evidential purposes the testimony of anybody who knows it is sufficient.

Mr. Lewin:—Yes, but how about a conclusion, your Honor, such as has been asked for here?

THE COURT:—I did not understand that it was asking for a conclusion.

Mr. Lewin:—I think he should have asked the witness when he received the applications and when they were passed on.

THE COURT:—What was the question?
(The reporter read as follows:)

Q.—Do you recall how promptly consideration was given to those applications after their receipt by the hospital?"

THE COURT:—I think he may state how long it took them to act upon them.

A.—There was no delay beyond that necessary for the orderly process by which such applications were received and acted upon.

By Mr. Leahy:

Q.—What was the result? A.—Those two applicants were admitted to courtesy privileges.

Mr. Lewin:—Will you fix the date?

Mr. Leahy:—I think he said in December 1937.

The Witness:—That is as near as my recollection will serve me.

By Mr. Leahy:

Q.—There is one other question that I forgot to ask you with reference to Dr. Selders' application, Doctor. Where applications come in for general surgical privileges on the courtesy staff of Garfield Hospital, does Garfield Hospital avail itself of the facilities of any other body with reference to an investigation which has to be made into the qualifications of the applicant? A.—It does.

Q.—What other body does Garfield Hospital usually engage in such matters? A.—The Washington Academy of Surgery.

Q.—How long has Garfield been doing that? A.—Ever since I have been on the Advisory Committee of the hospital.

Q.—And, once again, will you tell us how long that has been? A.—Certainly about ten years.

Q.—Do you recall now whether Garfield Hospital referred the investigation into the qualifications of Dr. Selders to the Academy of Surgery? A.—It did.

Q.—In doing so were they acting differently with reference to Dr. Selders from any other doctor who made application for such privileges? A.—Their action was entirely in accord with the usual practice.

MARCH 24—AFTER RECESS

TESTIMONY OF HENRY C. MACATEE

DIRECT EXAMINATION (RESUMED)

By Mr. Leahy:

Mr. Leahy:—U. S. Exhibit 450, which has been offered in evidence before, is dated January 31, 1938. It is directed to the superintendent of Garfield Memorial Hospital, Washington, D. C.:

"Dear Sir:

"The Committee on Hospital Privileges recommends the disapproval of the applications of the following men to do surgery in Garfield Memorial Hospital:"

And then follow one, two, three, four, five, six names. The last one is Dr. Selders'. Then it recommends the approval of about 45 others on that page and, continuing on the "approved list," some eight or ten; minor surgery; then follows orthopedic surgery and urologic surgery.

"I am returning the applications to practice at Garfield Hospital in other branches of medicine and surgery which the Committee feels it is impossible to pass on.

"F. C. Fishback,

"Secretary,

"Washington Academy of Surgery."

By Mr. Leahy:

Q.—Doctor, can you, by glancing down the list of the six doctors whose applications for hospital privileges were recommended to be disapproved, tell us whether any members of those were members of the District Medical Society? A.—I think four of them are.

Mr. Lewin:—Objected to. Objected to. We don't want his thoughts about it, I don't believe.

By Mr. Leahy:

Q.—Well, I mean if you know? A.—To the best of my knowledge four of them are.

TESTIMONY OF WALTER ESTELL LEE

DIRECT EXAMINATION

By Mr. Leahy:

Walter Estell Lee said that he resides in Philadelphia. He is connected with the Graduate School of the University of Pennsylvania as Professor of surgery since 1920. He was a graduate of the University of Pennsylvania in 1902. After graduation he trained at the Pennsylvania Hospital and was there for six years before leaving. He identified his signature on a letter to Dr. Frederick Sanderson at Washington. He identified also letters to Dr. George A. MacIver, Superintendent, Worcester City Hospital, Worcester, Massachusetts; Miss Edna H. Treasure, Superintendent, National Homeopathic Hospital, Washington, D. C. and to Dr. Lewis Taylor, Sibley Memorial Hospital, Washington, D. C.

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. Lee, who was the dean of the Graduate School of Medicine of the University of Pennsylvania in the year 1937 and the year 1938? A.—Dr. George H. Meeker.

Q.—Do you know whether he would have knowledge of the qualifications of students in that school?

Mr. Leahy:—I object. It would be outside the direct.

Mr. Lewin:—I think he testified as to his position with the—

THE COURT:—It goes beyond the direct examination. Objection sustained.

Then after considerable argument between attorneys he identified some other signatures.

TESTIMONY OF HENRY C. MACATEE

FURTHER DIRECT EXAMINATION

By Mr. Leahy:

Q.—Doctor, I want to hand you a booklet here and ask you if you can identify that, please. A.—Yes, sir. It belongs to me.

Q.—And what is it? A.—It is the final report of the Committee on Costs of Medical Care, including a majority report and several minority reports.

Q.—And is there a minority report in there which perhaps we could identify by saying it is the larger of the minority reports submitted? A.—It is called, I think, the principal minority report in the book.

Q.—It has been introduced here in evidence, Doctor, that the American Medical Association approved the minority report of that committee on the cost of medical care. Do you recall now or can you identify which of the minority reports therein the American Medical Association adopted? A.—The American Medical Association approved as its own policy the minority report No. 1 as contained in this book.

Q.—Do you recall who moved the motion for the adoption? A.—I did.

Mr. Leahy:—I just wish to read to the jury the recommendations of the principal minority group.

Mr. Kelleher:—I object. Excuse me, Mr. Leahy. I didn't know you were offering that.

Mr. Leahy:—Yes.

Mr. Kelleher:—We object to offering just the minority report without offering the entire report of the Committee.

Mr. Leahy:—All right; I will let it all go in, the whole book.

Mr. Kelleher:—All right.

Mr. Leahy:—Tickled pink.

THE COURT:—Just a minute.

Mr. Leahy:—(Reading:) "Recommendations of the Principal Minority Group."

THE COURT:—Just a minute, Mr. Leahy. What is the whole book?

Mr. Leahy:—I don't know. It is a majority report, there. Look (indicating).

THE COURT:—Yes. We haven't got to listen to all that, have we?

Mr. Leahy:—I hope not. I wouldn't dare read it. I don't know what it's all about.

Mr. Kelleher:—Your Honor, there is one, there is a single chapter in there for the recommendations of the majority report and a second report called the minority report.

THE COURT:—Let me say, gentlemen, of course you have a rebuttal coming, see; and if you deem that any other evidence is proper rebuttal evidence, you have a right and your time will come to offer it in evidence at that time. Don't you see?

Mr. Kelleher:—Yes, your Honor.

THE COURT:—In other words, strictly speaking, it isn't your time to be offering evidence.

Mr. Kelleher:—My objection is addressed to this:—

THE COURT:—Go ahead.

Mr. Kelleher:—That he is offering just the part of a document and not the whole, and that when he offers a part we are entitled to have the whole in.

Mr. Leahy:—No.

Mr. Kelleher:—During his case.

THE COURT:—He is offering his report.

Mr. Leahy:—I am offering the minority report. Mr. Kelleher, I think himself, introduced evidence of the adoption of the minority report.

Mr. Kelleher:—That is correct, but we didn't—

Mr. Leahy:—Now I want the jury to know what he introduced it for.

Mr. Kelleher:—Yes, but I think—but we didn't offer the majority.

THE COURT:—Well, I think when the proper time comes if you deem that the majority report is a proper part of the evidence you may offer it, and we can deal with it. I have gotten to the point, gentlemen, that I am a little interested in keeping this record down as much as I reasonably can and from now on limiting the scope of evidence as much as I reasonably can, without being too strict about it. I want to check on you gentlemen a little bit on both sides.

Mr. Leahy:—If your Honor please, I am not going to read that. Frankly, I wouldn't know what it's all about if I did.

These are the recommendations of the principal minority group:

"I. The minority recommends that government competition in the practice of medicine be discontinued and that its activities be restricted (a) to the care of the indigent and those patients with diseases which can be cared for only in governmental institutions; (b) to the promotion of public health; (c) to the support of the medical departments of the Army and

Navy, Coast and Geodetic Survey, and other government services which cannot because of their nature or location be served by the general medical profession; and (d) to the care of veterans suffering from bona fide service-connected disabilities and diseases, except in the case of tuberculosis and nervous and mental diseases.

"II. The minority recommends that government care of the indigent be expanded with the ultimate object of relieving the medical profession of this burden.

"III. The minority joins with the Committee in recommending that the study, evaluation, and coordination of medical service be considered important functions for every state and local community, that agencies be formed to exercise these functions, and that the coordination of rural with urban services receive special attention.

"IV. The minority recommends that united attempts be made to restore the general practitioner to the central place in medical practice.

"V. The minority recommends that the corporate practice of medicine, financed through intermediary agencies, be vigorously and persistently opposed as being economically wasteful, inimical to a continued and sustained high quality of medical care, or unfair exploitation of the medical profession.

"VI. The minority recommends that methods be given careful trial which can rightly be fitted into our present institutions and agencies without interfering with the fundamentals of medical practice.

"VII. The minority recommends the development by state or county medical societies of plans for medical care."

CROSS EXAMINATION

By Mr. Lewin:

Q.—Dr. Macatee, you were the chief of the staff, weren't you, at Garfield Hospital in the fall of 1937? A.—I was president of the staff.

Q.—Would that correspond to the chief of staff? A.—No, that does not.

Q.—Was there a chief of staff in addition to a president? A.—No; we did not have the system of chiefs of staff at Garfield.

Q.—I see. Would a letter addressed to Chief of Staff ordinarily come to you as president of the staff? A.—I think most likely it would.

Q.—Yes. Well, now, as president of the staff, the application of Dr. Selders made Nov. 10, 1937, was referred to you, was it not? A.—It was referred to my committee, the committee of which I was chairman.

Q.—I see. A.—Namely, the advisory committee.

Q.—Yes. And didn't that application consist of a filled-out form dated Nov. 10, 1937 (exhibiting a photostat to the witness)? A.—That is a form used at Garfield Hospital.

Q.—Yes. Well, I say, didn't his application— A.—It did.

Q.—Yes. Now, didn't it give his name and address and place and date of birth? A.—It did.

Q.—Did it give his degrees that he had received in medicine and in science? A.—It did.

Q.—And the institutions from which he had received those degrees? A.—Looking at the application, it does.

Q.—Yes. And didn't it show that he was a graduate of the University of Oklahoma Medical School in 1927? Right here (indicating). A.—It does.

Q.—And doesn't it show that he was then, at the time of the application, a man 40 years old? A.—It does.

Q.—Doesn't it show that he was a member of the American Medical Association through his membership in the Harris County, Texas, Association? A.—It does.

Q.—Doesn't it show that he had had teaching experience at the University of Oklahoma and at various hospitals in Texas and at Worcester City Hospital in Massachusetts? A.—It does.

Q.—Doesn't it show that he had had courtesy staff privileges at various hospitals, including St. Joseph's Infirmary, the Methodist Hospital, and the Memorial Hospital in Houston, Texas? A.—It does.

Q.—Doesn't it show that he had been a contributor to medical literature, and doesn't it give the titles of his disquisitions? A.—It does.

Q.—And doesn't it give as references the names of three persons to whom your hospital might write if they wanted to learn about him? A.—It does.

Q.—And aren't those references United States Senator Lee of Oklahoma, Dr. Walter E. Lee who was on the stand a few moments ago, a surgeon of Philadelphia, and Dr. John T. Moore, of Houston, Texas? A.—It does.

Q.—And then doesn't the application conclude with the statement that the applicant agrees to abide by the by-laws of the staff and such rules and regulations as may be from time to time enacted? A.—It does, yes.

Q.—Now, this is the application that came to your committee, is it not (indicating)? A.—It seems to be a photostatic copy of it.

Q.—Now let me ask you whether you communicated or your committee communicated with Senator Lee with regard to the applicant. A.—I don't know.

Q.—What? A.—I don't know.

Q.—You didn't, did you? A.—I did not.

Q.—And have you any knowledge that anybody on your committee did? A.—I have no such knowledge.

Q.—Yes. Now let me ask you whether you or your committee or anybody on the committee communicated with Dr. Walter E. Lee, the second reference? A.—Not to my knowledge.

Q.—And let me ask you the same thing with regard to Dr. John T. Moore, of Houston, Texas? A.—Not to my knowledge.

Q.—As far as you know none of these references were ever communicated with; is that correct? A.—Not by me.

Q.—Or by any committee of your hospital or medical staffs of your hospital?

Mr. Kellcher:—To your knowledge.

By Mr. Lewin:

Q.—To your knowledge? A.—To my knowledge, no.

Q.—Now, Dr. Macatee, isn't it true that following receipt of that application you received a letter from Dr. Conklin, the secretary of the Medical Society of the District of Columbia, addressed to the chief of staff of Garfield Memorial Hospital, dated Dec. 2, 1937? A.—I have no independent knowledge of that letter.

Q.—Such a letter as that is in evidence, Dr. Macatee, and it is addressed to the chief of staff. Would you ordinarily receive it? A.—Yes.

Q.—And didn't it include a resolution adopted by the District Medical Society on Dec. 1, 1937? A.—It did.

Q.—And didn't that tell you this: that the District Medical Society has resolved, as a matter of educational policy, it strongly recommended that all hospitals, including yours, engaged in the teaching and training of residents, interns, and nurses, where possible, follow the recommendation of the American Medical Association regarding the constitution of their entire staffs, both the regular staff and the courtesy staff; that each member of that staff be a member of the American Medical Association and of the local societies here either in Washington or in nearby states?

Do you want to refresh your recollection? (Handing an exhibit to the witness.) Is that correct? A.—I didn't understand it was addressed as a question. That is the purport of the resolution.

Q.—Yes. And wasn't that resolution taken up at the advisory committee of the medical staff of Garfield Memorial Hospital on Dec. 6, 1937? A.—It was.

Q.—And were you present at that time? A.—I don't know. There's nothing in that to—

Q.—If you were, you would be the presiding officer, would you not? A.—I would, yes.

Q.—And you would ordinarily be present at such meetings, would you not? A.—I would.

Q.—Well, isn't it a fact that the secretary was directed by the advisory committee to reply to the communication that I just showed you from the District Medical Society? A.—That is what the minutes show.

Q.—Yes. And wasn't the secretary a defendant in this case, Dr. F. X. McGovern? A.—He was.

Q.—Yes. And as a matter of fact didn't he reply to Dr. Conklin by his letter dated Jan. 3, 1938 (handing a photostat to the witness)? A.—That exhibit indicates that he did, yes.

Q.—And didn't he say that in reply to that letter, and enclosing the resolution, that he had been requested to advise Dr. Conklin and the Medical Society that the present policy in force at Garfield Hospital is in conformity with the provisions of that resolution? A.—That's what the letter states.

Q.—That's what the letter states. And as far as you know, there is no question but that it states the correct fact; isn't that so? A.—Not with the emphasis on "present," as you put it.

Q.—Oh, really? Well, now, I thought I understood you to testify that you hadn't made any change with regard to that policy at Garfield Memorial Hospital throughout the two years 1937 and 1938. A.—That's my recollection of the fact.

Q.—Is the defendant Warfield a member of your medical staff? A.—He is.

Q.—Yes. Well, let me show you what purports to be his answers to a questionnaire given him by a committee of which he was chairman, a hospital committee of the District Medical Society, and see if this refreshes your recollection:

"Question 8: Does your hospital require membership in the Medical Society of the District of Columbia as a qualification for appointments to its medical staff?"

And isn't his answer, "Yes, or have applied"? A.—That is the answer given there.

Q.—Yes. And is that correct? A.—It is not.

Q.—Question 9 is, "What percentage of the entire medical staff of your hospital are members of the Medical Society of the District of Columbia?"

And his answer is, "Over 75 per cent. All recent appointments."

That is the answer, isn't it? A.—That's the answer given there.

Q.—Does that refresh your recollection that on or about that time, although only 75 per cent were then members of the District Medical Society, all recent appointments were required to be members? A.—That does not refresh my recollection.

Q.—Would you deny that that was the fact? A.—I do.

Q.—Would you deny that about this time, after the receipt of the resolution of the District Medical Society, you changed your policy to require all new, recent appointments to apply for membership in the District Medical Society? A.—Not within my recollection.

Q.—It's simply a question of your recollection, is it? A.—Yes.

Q.—Isn't it true also that Dr. Warfield, in answer to the question, "Is your hospital in sympathy with the policies of the Medical Society of the District of Columbia?" replied "Yes"? A.—That is his answer.

Q.—And wasn't he speaking with regard to Group Health Association when that answer was made?

Mr. Leahy:—I object. It calls for a conclusion of the witness.

By Mr. Lewin:

Q.—And the policies of Group Health Association as appearing in the first question?

Mr. Leahy:—I object.

THE COURT:—Well, I don't know what the paper states, Mr. Lewin.

Mr. Lewin:—Would you like to see it?

THE COURT:—Unless this gentleman had something to do with the making of that paper or authorized the making of it, or something like that, I do not see how he is bound by that.

Mr. Lewin:—No, I didn't mean to bind him. I was wondering if I might refresh his recollection as to these facts.

The Witness:—I have no recollection of the paper.

By Mr. Lewin:

Q.—Well, have you any recollection of the fact that your hospital was then in sympathy with the policies of the District Medical Society with regard to Group Health Association? A.—I couldn't make that statement then or now.

Q.—Now, isn't it true that the superintendent of the Garfield Memorial Hospital referred Dr. Selders' application which I have just shown you to the Committee on Surgical Privileges? A.—Yes.

Q.—And I believe you said that committee included Dr. Carr and Dr. McGovern and Dr. Charles Stanley White and Dr. Strine; am I correct? A.—Yes.

Q.—Now, didn't he say, when he submitted this to them for their opinion, that "This," speaking of Selders' application, "is not a 'Run of Mine' case, and your action may be far reaching. Information shows him"—that is Selders—"to have sufficient training for personal recognition, when compared with many now approved for courtesy privileges at Garfield Memorial Hospital. He is a member in good standing in A. M. A., County and State Medical Societies in Texas, and was returning from Massachusetts to Texas when offered the position with H. O. L. C."?

Doesn't he also say that "Should your recommendation be adverse, for other than personal qualifications, request they be stated, in order that the Board of Directors might have the benefit of your advice and counsel"? Am I correct? A.—That is what the letter states.

Q.—Yes. Now, didn't you know that that had been done? A.—I did not.

Q.—Was the surgical service, as far as you know, authorized to pass on this applicant for anything other than his personal qualifications? A.—My answer is that there is no regulation which directs the surgical service how it shall reach its conclusions with regard to applications.

Q.—So if such a report were referred to you, you would think that you had the right to take into consideration anything whatever in addition to the man's personal standing or his professional capacity and qualifications? A.—I would think from that letter that I was put on notice to be especially careful to look into his qualifications fully.

Q.—And you would think you were put on notice to do that because of his connection with Group Health Association, wouldn't you? A.—At that particular time I would think so,

because of the very strong and very bitter publicity directed at the hospitals in the public press of this city.

Q.—Now let me ask you whether Dr. McGovern, the secretary to your advisory committee, wasn't authorized and did not reply to Mr. Aspinwall with regard to this application of Dr. Selders? *A.*—He did.

Q.—Now, was he speaking for the advisory committee of the medical staff when he so wrote? *A.*—He was.

Q.—Therefore he was speaking for you, wasn't he, among others? *A.*—I am presiding officer of the advisory committee, without vote.

Q.—And would you say he was speaking for you or he was not? *A.*—He was speaking for me because I was in sympathy with the action of the advisory committee.

Q.—He was? *A.*—I think it was taken on good grounds.

Q.—Yes. And were you in sympathy with the reasons which Dr. McGovern said prompted that resolution? *A.*—I was.

Q.—All right. And wasn't this the resolution: "That pending the settlement of the question raised as to the ethical status of Group Health Association, Inc., and pending further study of the professional qualifications of Dr. Raymond E. Selders, that he be not granted courtesy privileges at Garfield Memorial Hospital, except of course in a real emergency"? *A.*—That is correct.

Q.—Now, there you were delaying action pending the ethical status not of Dr. Selders but of the organization to which he belonged; am I correct? *A.*—That is one statement.

Q.—Yes. And isn't this the reason that was given for it: "The reason prompting this recommendation is the fact that Group Health Association, Inc., a lay corporation, is considered unethical by the Medical Society of the District of Columbia, and its legality is being questioned"? Is that right? *A.*—That is the statement of the letter.

Q.—Yes. And isn't it a fact within your knowledge that it was then considered unethical by the Medical Society of the District of Columbia? *A.*—That is true.

Q.—Does not the reason continue that "Dr. Selders has been hired by Group Health Association as its surgeon. It is the opinion of the Advisory Committee that if the Garfield Hospital allows Dr. Selders courtesy privileges that it would be placed in the light of aiding and abetting Group Health Association, Inc."? *A.*—That is what the letter states.

Q.—And that was your reason, was it not? *A.*—Yes.

Q.—And that was your reason, although you had not yet communicated with Dr. Selders' references or heard any report on his professional qualifications?

Mr. Leahy:—Now, wait a minute. That is a double-barreled question.

Mr. Lewin:—All right, let us take it step by step.

Mr. Leahy:—What do you mean by one? and then we'll get it.

By Mr. Lewin:

Q.—At that time you hadn't communicated with his references, had you? *A.*—Indirectly we had.

Q.—You mean you referred it to the Washington Academy of Surgery? *A.*—I do.

Q.—When did you do that? *A.*—I don't know.

Q.—Well, did you do it before or after this letter? *A.*—The rule was to require them—the applications as they came in.

Q.—Did you refer it to the Washington Academy of Surgery on Dec. 6, 1937 (exhibiting a photostat to the witness)? *A.*—We did.

Q.—And had you heard from the Washington Academy of Surgery?

Mr. Leahy:—Now, pardon me. Would you just give me the date of the letter you are referring to, Mr. Lewin?

Mr. Lewin:—Yes. I will give you both references. The reference was December 6, and the letter I have examined him about was December 17.

By Mr. Lewin:

Q.—Had you had any response from the Washington Academy of Surgery at that time? *A.*—The response from the Washington Academy of Surgery would come to the surgical group of the staff and not to the advisory committee.

Q.—So the reason which you advised the president of the hospital that to approve Selders would be aiding and abetting Group Health Association antedated this letter by over a month; am I correct? *A.*—Yes.

Q.—And did the Washington Academy of Surgery give you any grounds for recommending against Dr. Selders' application? Will you gaze at that letter again and see whether it discloses any reasons at all? *A.*—That letter gives no grounds.

Q.—Now, as a matter of fact, before you received any word from the Washington Academy of Surgery your board of direc-

tors on January 25 had already withdrawn Dr. Selders' temporary privileges and denied him courtesy privileges; isn't that correct? *A.*—On two grounds recommended to them.

Q.—Yes. On two grounds. And that was six days before you got any report about his qualifications; am I right? *A.*—Yes, because there were other sufficient grounds.

Q.—Yes. And weren't those grounds the grounds recommended by the medical staff? *A.*—They were the grounds recommended by the medical staff.

Q.—Yes. And wasn't the action of the directors predicated upon the recommendation of the medical staff? *A.*—It was.

Q.—And didn't Dr. Eisenman so tell Dr. Selders (handing a letter to the witness)? *A.*—He did.

Q.—And isn't it true also that before you received any reply from the Washington Academy of Surgery your president had received a letter from the president of Emergency Hospital asking for an explanation for the admission of Miss Sara Abbott to the Garfield Memorial Hospital (handing a letter to the witness)? *A.*—That letter is not within my knowledge until you exhibit it here.

Q.—You never had any knowledge of that? *A.*—I never had any knowledge of it.

Q.—Did you have any knowledge of President Aspinwall's reply giving the explanation? *A.*—None.

Q.—Did you know that copies of both those letters were sent to the District Medical Society at the time they were written? *A.*—I did not.

Q.—Now, the Castle letter which was offered this morning was dated March 30, was it not? *A.*—Yes.

Q.—And at that time the Board of Directors had turned down Dr. Selders on January 25? *A.*—It had.

Q.—And it denied him even temporary privileges; is that correct? *A.*—It had.

Q.—And at that time also your medical staff had met in March and had confirmed that action, had it not? *A.*—The medical staff does not confirm the action of the Board of Directors.

Q.—Well, didn't you go along with that action in March of 1938? *A.*—The Board of Directors having acted, the medical staff had nothing further to do with it.

Q.—Didn't the medical staff consider it again in March of 1938? *A.*—I have no recollection of it.

Q.—On Feb. 2, 1938 did not the medical staff meet (handing the witness a paper)? *A.*—What is this document?

Q.—These are my notes. Do they refresh your recollection? *A.*—Only to the extent that that would be about the time when the medical staff would normally meet.

Q.—Did you not attend that meeting? *A.*—I could not tell you at this late date.

Q.—Did you not present information there with regard to Dr. Selders' application? *A.*—My recollection would have to be refreshed.

Q.—All right. Here is a photostatic copy of the minutes themselves. Will you look at them and see whether or not they refresh your recollection? *A.*—All right.

Q.—Is it not true that when Miss Tew was admitted to Garfield Memorial Hospital for a short time in February of 1938 Dr. Selders then had privileges to bring a person there in an emergency? *A.*—He had, and he might still have.

Q.—Is it not true that at that time you had no formal definition of an emergency? *A.*—That is true.

Q.—Is it not true that at that time you relied upon the judgment of the surgeon bringing the patient as to whether or not it was an emergency? *A.*—I could not unqualifiedly answer Yes to that, sir.

Q.—Would not the judgment of the attending surgeon ordinarily be the criterion of admission of an emergency case? *A.*—If he had courtesy privileges.

Q.—Suppose he did not have. *A.*—That would not be the criterion.

Q.—Suppose he had privileges to bring a patient there in an emergency? *A.*—He would in an emergency.

Q.—I ask you again, did you have any rules or regulations governing the definition of an emergency at that time? *A.*—None governing the definition of "emergency," but plenty governing the admission of surgeons not on the courtesy staff.

Q.—As a matter of fact, following the Tew incident you drew up this definition of "emergency"? *A.*—I did.

Q.—And that is the first time you ever had such a definition? *A.*—I do not know as to that.

Q.—In that definition you said specifically that it was to apply to Group Health Association, did you not? *A.*—I said that the definition would apply to Group Health Association so that there would be no question involved.

Q.—You did not pick out anybody else or any other clinic to whom it might apply in specific terms? A.—No.

Q.—Is it not a fact that you made a copy of the definition of "emergency" available to the other hospitals in the District of Columbia? A.—I did not.

Q.—Is it not a fact that the other hospitals in the District of Columbia applied to your hospital for that definition so that they might keep it? A.—I have been told so.

Q.—The action of the surgical service in recommending against Dr. Selders was based upon the ethical status of Group Health Association and the fact that the legality of Group Health was being questioned? A.—There was another reason advanced by the surgical service.

Q.—But pending the study of Dr. Selders— A.—There was another reason advanced by the surgical service.

Q.—What was that? A.—It was that being the sole surgeon of a large group of people they would not be able to grant him surgical privileges.

Q.—Will you find the statement of any action which the surgical service took in December of 1937? Have you any notes here with you? A.—No.

Q.—The folder that you have in your lap—does that contain hospital documents at all? A.—It does not.

Q.—Suppose you look at these, then (handing papers to the witness). I show you Dr. McGovern's report to the president. Does that indicate that the reason you just mentioned was presented?

THE COURT:—Maybe you can get at it in this way. Was it a matter of record or not?

THE WITNESS:—I did not catch that.

THE COURT:—Was this additional reason a matter of record?

THE WITNESS:—Yes, sir.

By Mr. Lewin:

Q.—I show you the minutes of the Executive Committee of the Board of Directors and ask you if there is anything in that that could be interpreted as being the reason you suggested?

MR. LEAHY:—What is the date?

MR. LEWIN:—Dec. 28, 1937.

THE COURT:—If I may suggest: Maybe he can indicate what paper it would be.

MR. LEWIN:—I wish he would.

By Mr. Lewin:

Q.—Can you so indicate? A.—My information is it was a letter addressed by Dr. Hooe of the Surgical Service to me as Chairman of the Advisory Committee.

Q.—Was it not addressed to you in the fall of 1938? A.—I don't remember the date of it.

MR. LEAHY:—I have a copy of it right here.

By Mr. Lewin:

Q.—Am I correct that it was Nov. 21, 1938? A.—It was; evidently referring to a second application after legality had been determined.

Q.—So that the reasons given in the fall of 1937 and the reasons given for the denial of privileges in January 1938 did not include this reason which you have now mentioned as the additional one? A.—It is not so stated in the record.

Q.—Did you not just tell his Honor that it was stated in the record, if it was stated at all? A.—It was not so stated in the record.

MR. LEAHY:—His Honor asked him if it was made a matter of record, and he said "Yes."

THE COURT:—I thought he referred to a letter.

By Mr. Lewin:

Q.—Now, Dr. Macatee, after you received notice of Mr. Justice Bailey's decision upholding the legality of Group Health Association, was Selders admitted to your staff? A.—He was not.

Q.—Was he admitted at any time during 1938 after his temporary privileges were withdrawn? A.—So far as I know, he was not.

Q.—And down to the date of the indictment he was not admitted, was he? A.—He was not.

Q.—Although in the fall of 1938 he made an additional application? A.—Yes.

Q.—And you simply let it take the same course, did you not? A.—Yes.

Q.—And referred it to those various committees? A.—I don't know whether all the references were made or not.

Q.—Were references communicated with in the fall of 1938? A.—I don't know.

Q.—So far as you know, there was nothing more that happened except to send the applications through the mill again? A.—Yes. In the operation of the mill I had nothing to do

normally, in my official capacity, with following up these references or making any communications having to do with them.

Q.—What were the names of the two Group Health Association doctors who were admitted in 1938? A.—One, I think, was Dr. Price, and the other, my recollection is was a Dr. Halstead. I am not sure.

Q.—Dr. Halstead testified to the contrary when he was on the stand. Could it have been Dr. Bowe?

MR. LEAHY:—Testified to the contrary of what?

MR. LEWIN:—He testified that he was not admitted to the staff of Garfield Hospital in 1938. There cannot be any doubt about that.

MR. LEAHY:—I don't know. It is too far back for me.

THE WITNESS:—The name Bowe sounds familiar.

By Mr. Lewin:

Q.—It may have been Dr. Bowe and Dr. Price? A.—Yes.

Q.—As a matter of fact, were not those gentlemen admitted for the first time on Dec. 19, 1938? A.—Yes.

Q.—And, as a matter of fact, did not you and your colleagues at the hospital know that a grand jury of the United States had been convened in the late summer of 1938 and was investigating this very matter at the time they were admitted? A.—I don't think that entered into the consideration of the matter.

Q.—I did not ask you that. I asked you whether you did not know that that was so. A.—No; I don't know that it is so, but I do know that that would not influence me.

Q.—As a matter of fact, don't you know that those gentlemen were admitted for the first time two days before the indictment in this case came down? A.—I don't know that.

Q.—What would your testimony be now with regard to Dr. Halstead? Does that refresh your recollection that he was not admitted at all? A.—No; I don't remember.

Q.—On your direct examination, Dr. Macatee, I find on referring to the record, page 4470, that you gave this testimony. Mr. Leahy asked you with regard to the so-called White List—

Q.—Do you recall, Doctor, at what date, if any, any authorization was made to prepare an approved list which has been called a White List?

And you answered:

"That was incorporated in the constitutional amendment adopted in March 1937, in which the Executive Committee was charged with the duty of preparing such a list."

Do you remember that testimony? A.—I do.

Q.—When you said it was incorporated in the constitutional amendment, you did not mean that the list itself was incorporated in that amendment, did you? A.—I did not; the authorization.

Q.—Then you were asked:

"Q.—I ask you, Doctor, if the preparation of an approved list had anything whatsoever to do with Group Health Association."

And you answered:

"A.—Nothing whatsoever."

Do you remember that? A.—I do.

Q.—Do you still stand on that testimony? A.—I do.

Q.—Did you mean to confine your answer to the preparation of an approved list back in March, or the preparation of the approved list in July of 1937? A.—I meant to limit it to the preparation of an approved list in July 1937.

Q.—You did? A.—Yes.

Q.—So that your testimony is that the preparation of the approved list in July of 1937 had nothing whatsoever to do with Group Health Association? A.—Yes.

Q.—You also testified on page 4483 of the record as follows:

"Q.—Did that approved list, as it came before the Executive Committee on July 12, 1937 have anything whatsoever to do with the approval or disapproval of Group Health Association, Incorporated?"

And your answer was:

"A.—It did not."

Do you remember that testimony. A.—I do.

Q.—Do you stand on that testimony? A.—I stand on it.

Q.—By that did you mean to limit your answer to the approved list as it came before the Executive Committee, or did it include also as it left the Executive Committee on July 12, 1937? In other words, is there any point in this definition as it came before the Executive Committee—

MR. LEAHY:—I made no point of that.

A.—There is no point in that. My answer is the same both as it came before and as it left.

By Mr. Lewin:

Q.—And your testimony is that it had nothing to do with Group Health Association and was not directed at Group Health Association? A.—That is true.

Q.—Did you mean to testify also that when it was first authorized to be issued to the hospitals as well as the members on June 21, 1937 it was not aimed at Group Health and had nothing to do with it? A.—It was not. It was unfinished business left over from March 25.

Q.—Is it also your testimony that when it was sent out on July 29 both to the members of the District of Columbia Medical Society and to all the private hospitals, that then it was not directed toward Group Health Association? A.—It was not.

Q.—Is it not true that the committee which was appointed in March 1937 to prepare this White List consisted of the defendant McGovern as Chairman, and of the defendant Hooe and of another doctor named Dr. Daniel Borden? A.—I don't recollect the composition of the committee.

Q.—To refresh your recollection I show you the minutes of March 19, 1937. A.—Yes; that would be the committee.

Q.—And the committee then consisted of three, two of whom are defendants in this case; is that correct? A.—Are defendants; yes.

Q.—Is it not true that the first approved list which was sent out under Section 5 was approved by the Executive Committee on July 12, 1937? A.—I think that is the correct date.

Q.—No list under Section 5 had been approved by the Executive Committee or the Society prior to that date? A.—That is true.

Q.—Is it not true that on July 12, 1937 the Executive Committee had had the subject of Group Health before it on a number of occasions? A.—On two occasions.

Q.—Had it not discussed the Group Health Association situation on June 1? A.—It had.

Q.—At an executive hearing to which Colonel Jones came? A.—Yes.

Q.—And at which a committee was appointed to make further study? A.—Yes.

Q.—And was not that committee required to cooperate with Dr. Verbruycke's committee on Medical Economics? A.—Yes.

Q.—And was not Dr. Yater a member of Dr. Verbruycke's committee? A.—I don't know.

Q.—Dr. Yater is a defendant in this case, is he not? A.—Yes.

Q.—If the records show he was a member of that committee you would have no doubt of that, would you? A.—I would not.

Q.—Did not the committee include Dr. McGovern as Chairman of the committee, and Dr. Hooe? A.—Include them?

Q.—Yes, those two. A.—Yes.

Q.—And they were the same McGovern and Hooe who were on the committee to prepare the approved list; is that right? A.—Yes.

Q.—Is it not true that Group Health Association had been discussed by the Executive Committee on June 21? A.—That is true.

Q.—And at that meeting Dr. Verbruycke had made his first report for both his committees? A.—Yes, sir.

Q.—And at that meeting you had decided to have a conference with Dr. Brown of Group Health on June 21? A.—That is true.

Q.—And had not Group Health Association been pretty fully discussed at that meeting with Dr. Brown and Mr. Penniman and some of those other gentlemen on June 24? A.—That is true.

Q.—Is it not also true that you and a number of defendants in this case had discussed Group Health Association on May 16 in Dr. William Gerry Morgan's office? A.—That is true.

Q.—Is it not true also that you and a number of the defendants in this case discussed this subject with Dr. Olin West of the American Medical Association in the early part of June? A.—I don't think I had.

Q.—Did you not know that a committee had met with Dr. West? A.—Pardon me. I had discussed it with Dr. West in Atlantic City.

Q.—And had you not also discussed it with him at the Metropolitan Club? A.—No, sir.

Q.—Did you not know that some of them had done so? A.—I heard so.

Q.—But you say you discussed it with him at Atlantic City? A.—Yes.

Q.—That was June 9 or 10, was it not? A.—Yes.

Q.—So, would you say it had been discussed by you and others prior to July 12, 1937 on some seven occasions? A.—Yes.

Q.—Is that correct? A.—I don't know how it adds up, but it may have been that many times.

THE COURT:—Let us call it seven.

Mr. Lewin:—It is six or seven.

By Mr. Lewin:

Q.—Let me hand you the minutes of this meeting of July 12. Will you refer to the minutes of July 12, 1937, which are the

minutes of the meeting at which the list was approved, and see if the committee of which Dr. McGovern was chairman did not report? A.—It did.

Q.—And did he not adopt as his report the report prepared by Dr. Verbruycke? A.—Yes.

Q.—And was not that adopted by Dr. McGovern's committee of which you were a member, as the report of the committee? A.—Yes.

Q.—Is it not true that in the report the following appears with regard to Group Health:

"Active opposition is possible at present. Whether it is advisable is another matter, unless some substitute plan can be suggested"

Mr. Leahy:—Just a moment. That report was not adopted.

Mr. Lewin:—The witness has just testified to the contrary.

Mr. Leahy:—I object, if your Honor please, because I know distinctly what counsel is directing the attention of the witness to. There were two reports. One report was adopted and the other was tabled. He is now directing the attention of the witness to the one that was tabled.

Mr. Lewin:—Your Honor, I did not ask him for the action of the Executive Committee on this report. I asked him whether this is not the report of the committee headed by Dr. McGovern and of which he was a member.

Mr. Leahy:—No; you did not.

Mr. Lewin:—I beg your pardon; I did.

Mr. Leahy:—I will stand on the record.

THE COURT:—Is that what you want to ask him?

Mr. Lewin:—I pointed it out in the minutes.

THE COURT:—It will be understood.

By Mr. Lewin:

Q.—Is not this (indicating) what you and Dr. McGovern and Dr. Hooe and those others reported:

"Failure to place a cooperative on the approved list of the Medical Society would automatically forbid any consultations by members of our Society. Any full time employees of the Corporation could probably easily fail to be put on the courtesy list of the hospitals for one reason or another without the fact of his connection with the cooperative being even mentioned. In fact, any combative methods would necessarily have to be camouflaged to the nth degree."

Am I right? A.—Are you right in what?

Q.—That that was part of your report, or the report of the committee headed by the defendant McGovern. A.—Is this document that you are reading a letter addressed to Dr. McGovern by Dr. Verbruycke after he had relinquished his post as chairman of the Executive Committee?

Q.—Is not this correct? Let us have no doubt about it. At the first part of that meeting did not this transpire—

Mr. Leahy:—Why don't you ask the witness?

Mr. Lewin:—I am going to have him answer it from the minutes.

By Mr. Lewin:

Q.—Referring to the report which was prepared by Dr. J. Russell Verbruycke, who was then chairman of the committee on Medical Economics, it says:

"Since that time the committee has met and studied and reviewed supplementary plans that Dr. Verbruycke and Dr. McGovern offered as a report to the Executive Committee tonight."

Is that correct? Does that appear there? A.—That appears there; yes.

Q.—Does not the language that I have read you appear in that very report which Dr. McGovern offered as a report of his committee? A.—It appears in the letter from Dr. Verbruycke which was adopted only in principle.

Q.—Was it not adopted as your report? A.—In principle only.

Q.—Did you not testify that these minutes correctly reflected what transpired at that meeting? A.—If I did, then I qualify that answer.

Q.—You now qualify it to say this is not your report? A.—That is a report adopted in principle. It is not my report.

Q.—Do you see any place in the minutes where it says that it was adopted only in principle? A.—Did you not just read so?

Q.—I don't remember it. (Reading):

"Which Dr. McGovern offered as a report to the Executive Committee." Is there anything in there about offering it only in principle? A.—Yes. (Reading): "Was approved in principle by the Executive Committee at a subsequent meeting."

Q.—That was the original report, was it not, that was rendered on June 21, and does it not clearly show that? A.—(Reading) "The secretary made a motion that this letter be accepted as a report of the subcommittee and be approved in principle."

Q.—That is the action of the Executive Committee, is it not?
A.—That is the action of the Executive Committee.

Q.—Now I ask you whether the action of your subcommittee was not to adopt that as your report? A.—I cannot say that it was, because the report of the subcommittee was made extemporaneously and at the time there had not been any formal meeting of the committee and no formal action taken.

Q.—Do not the minutes here show that that was offered as the report of your committee and accepted as the report of your committee?

Mr. Leahy:—Point it out, please.

Mr. Lewin:—I have pointed it out a number of times.

Mr. Leahy:—Oh, no; you have not.

The Witness:—To get the picture, you have got—

By Mr. Lewin:

Q.—Now, wait. I have the picture. I want an answer to my question, Dr. Macatee. You answered very glibly before.

Mr. Leahy:—I object to the characterization.

THE COURT:—I will not permit any such remarks as that.

Mr. Lewin:—I am sorry, your Honor. I ask that the remark be withdrawn.

THE COURT:—Please do not let it be repeated.

Mr. Lewin:—Very well, your Honor.

By Mr. Lewin:

Q.—What is your answer to my question now? A.—What is the question?

Q.—I want to know whether the report from which I read was the report of your committee which was offered as the report of your committee and taken by the Executive Committee as the report of your committee? A.—It was a report offered by the chairman at that time without objection by other members of the subcommittee and adopted by the Executive Committee in principle only.

Q.—Is not this true, that it contained the language that I have read? A.—Yes.

Q.—Is it not true that when you said that failure to put a cooperative on the approved list of the Medical Society would automatically forbid consultation, were you not referring to this approved list, approved that very day or night, July 12, under Section 5? A.—That is probably the list referred to there.

Q.—And when you referred to failure to put a cooperative on the approved list were you not referring to Group Health Association? A.—I was not; the letter was.

Q.—Is not that what the report was referring to? A.—It was.

Q.—Is it not true also that there was an amendment and only one amendment to the approved list that night which was offered for approval of the Executive Committee? A.—I have no recollection of any amendment.

Q.—As a matter of fact, did you not object to Group Health Association on the ground that you thought it was an instrumentality of the Federal Government? A.—On the occasion of the consideration of the approved list?

Q.—Yes. A.—Group Health Association was not considered in the preparation of the approved list.

Q.—In these meetings prior to July 12, and on July 12, as disclosed by this report, was not one of your objections to Group Health Association that you regarded it as the Government coming into the practice of medicine? A.—That was one consideration.

Q.—Then at this time you regarded Group Health Association as connected in some way with the Federal Government, did you not? A.—Yes.

Q.—And would you regard some of its doctors on the staff of Group Health as being connected with the Federal Government? Is that right? A.—Yes.

Q.—Is it not true that when this report was first brought to the attention—that is, the report on the approved list, that item read, as one of the groups to be approved, "Medical personnel connected with the Federal and Municipal governments within the District of Columbia or within ten miles thereof? Is that right? A.—That is true.

Q.—If that list had been approved in that manner it would have carried— A.—Just a moment.

Q.—Wait a minute.

THE COURT:—He has a right to explain his answer.

Mr. Lewin:—He is trying to answer something else.

The Witness:—No; I am not. I am trying to answer that particular question, because that particular No. 10 had to do with services by medical officers and set up with statutory rights behind them.

By Mr. Lewin:

Q.—If item 10 had been approved as drawn, that you were approving of "medical personnel connected with the Federal

Government," it might have included Group Health Association and its members, might it not? A.—It might not.

Q.—You say it would have, do you? A.—Oh. I see the drift of your question now.

Q.—Just answer the question. Would it not? A.—Your question cannot be answered as put.

Q.—If you had permitted this report to go through with that item 10 reading that you approved the medical personnel connected with the Federal Government, that might have carried with it the approval of Group Health Association and its members, might it not? A.—It might have. I have no knowledge of its having been amended with that object in view.

Q.—But it was amended, was it not, and was not the amendment suggested by you? Am I right? A.—Yes. I said, "employed by" rather than "connected with."

Q.—Is this correct— A.—(Continuing) And the purpose of making the amendment was—

Q.—I did not ask you that:

"Dr. McGovern read the proposed list of approved organizations, groups, and individuals. Dr. Macatee suggested that the words 'employed by' be substituted for the words 'connected with' in item 10. With this change the list was approved upon motion duly seconded and adopted."

Is that correct? A.—That is correct.

Q.—So that after such amendment went through the list could not be construed as approval of Group Health Association or its members, whereas before it might have been? A.—The amendment had nothing to do with anything other than the grammatical construction of the document.

Q.—Nevertheless the amendment had the effect that I have just indicated, did it not?

Mr. Leahy:—I object. That is argumentative.

THE COURT:—Yes; that is argumentative.

A.—It is not my conclusion.

By Mr. Lewin:

Q.—Is it not true that when that list was amended and was ready to be issued the following transpired in the minutes, directly connected with the list itself and without intervening colloquy whatever:

"Dr. Raymond T. Holden Jr., inquired as to the personnel maintained in the proposed Group Health Association, Inc. Dr. Hooe pointed out that it was a separate individual corporation and would have to be approved as a single unit. As a matter of information Dr. Hooe would inquire if he was right in the assumption that this approved list would not have to be submitted to the Society, but from tonight would be filed in the secretary's office.

Does not that appear? A.—It appears.

Q.—Just in the way I have stated it, does it not? A.—Yes.

Q.—So that Group Health Association was specifically considered at the very time that the White List was approved, and in connection with it? A.—Group Health Association was specifically considered and excluded.

Q.—That is what I thought. A.—Excluded from consideration in connection with the White List.

Q.—Do you find anything that excludes it here (indicating)?

A.—(Reading) "Dr. Holden inquired as to the personnel maintained in the proposed Group Health Association. Dr. Hooe pointed out it was a separate individual corporation and would have to be approved as a single unit when it came up for consideration for approval."

Q.—Does it say "when it came up for consideration"? A.—No; but that is the meaning of it.

Q.—I think you testified that the reason it could not be approved then was because it had not made application for approval; is that right? A.—That among other things.

Q.—Did you not know that at that time it had been in existence as a corporation some five months? A.—I did not. I don't know how long it had had corporate existence. I had known of it only since about the middle of May.

Q.—Did you not know that in June and July it was an organization seeking medical personnel? A.—I did not know whether it was then seeking medical personnel.

Q.—Had not Dr. Brown told you that in his meeting with you on June 24? A.—He said that eventually it would seek medical personnel.

Q.—Did he not say they were seeking medical personnel then? A.—I don't recollect that.

Q.—Did you not know they had already approached Dr. Neill and asked him to come with the staff? A.—I had no knowledge of that.

Q.—Did you not say when you went down to see the representatives of Group Health that you understood approaches had been made to your members, on July 26? A.—Yes.

Q.—So you knew on July 26 that they were seeking medical personnel? A.—Obviously I did.

Q.—Do you think you gained that information between July 12 and July 26? A.—I don't know how I gained the information.

Q.—Dr. Macatee, did you not know on July 12 that they were seeking medical personnel and had been approaching some of your members? A.—I couldn't testify to that to save my life.

Q.—You would not deny it? A.—I cannot deny it; no.

Q.—If they were seeking medical personnel, would not this have been the most suitable time of all to decide whether to put that organization on the approved list or not?

Mr. Leahy:—I object as argumentative.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Was not the purpose of having an approved list to guide your members as to whether or not they could join up with or participate in certain organizations? A.—In certain organizations, but not Group Health Association.

Q.—That is what you said. But I ask you whether or not the whole purpose of the approved list was not to guide your members as to whether they could join or not?

Mr. Leahy:—Join what?

Mr. Lewin:—Organizations.

A.—The whole purpose of the approved list was in Chapter 9, Article 4, Section 5, which had to do with something else entirely, unrelated to Group Health Association.

Mr. Lewin:—I move that that be stricken as not responsive.

THE COURT:—You asked him what the purpose was.

By Mr. Lewin:

Q.—I asked you whether it was to indicate to your members whether they could participate with certain organizations. A.—My answer would have to be something of a recital, and that is that the amendment to the constitution began in January 1936, and it was amended in January 1937.

Mr. Lewin:—I do not think that is responsive, your Honor. I move that it be stricken as totally unresponsive.

The Witness:—And that it is—

Mr. Lewin:—I have a motion pending.

THE COURT:—Just a moment, Doctor. It is not always possible to answer a question yes or no. It may not give a correct impression. I think it is well, if he can answer yes or no, to do so, and then make any qualifications or explanations that are necessary. After all, it does not make much difference how you approach the answer. He was giving you his understanding of the purpose. You asked for the purpose. He was explaining to you the purpose as he understood it.

Mr. Lewin:—I most respectfully submit that the witness was giving me a history.

THE COURT:—I think the Doctor was getting away from the purpose.

The Witness:—My next sentence would complete the history.

Mr. Lewin:—I do not want the history. I move that all that history go out.

THE COURT:—He told you the purpose, and that is what you were after. Suppose you put another question.

By Mr. Lewin:

Q.—I will ask you this, whether it would not have been a more suitable time to put the organization on or off that list when they were in the formative stage and going around trying to get medical personnel, if you wanted to guide your own members? A.—It may have been a suitable time, but we did not have sufficient information about it to know at that time.

Q.—Now, Doctor, you said that one of the reasons it could not go on the approved list was because it had not applied for approval. A.—Did I say that?

Q.—That is what I recollect. Did you not say that? What is your answer? A.—I would rather say that in my report I said so in September.

Q.—Did you not testify here on Friday that that was the reason you could not put it on the approved list? A.—My memory fails me there, sir.

THE COURT:—Suppose you ask him now and save time.

By Mr. Lewin:

Q.—What is your answer now? Was that the reason you could not put it on the approved list, or one of them? Will you answer that question? A.—The answer is that it is bound up in the fact that at that meeting the special committee was charged to go down and have another talk with Group Health Association to see if we could not reach some accord.

Mr. Lewin:—I object, and ask that the answer be stricken as unresponsive.

THE COURT:—Have you got the record there?

Mr. Lewin:—Yes, sir.

By Mr. Lewin:

Q.—Did you not testify as follows:

“Q.—Did that approved list, as it came before the Executive Committee on July 12, 1937, have anything whatever to do with the approval or disapproval of Group Health Association, Inc.?” And you answered:

“A.—It did not.

“Q.—Why not?”

“A.—Because Group Health Association had not been at a stage of development where it had asked for approval or where approval could be given, for lack of information.”

Was that your testimony? A.—That sounds like it.

Q.—Can you tell me what other organizations that were approved and put on the approved list asked for approval at that time? A.—None. I say, none, Mr. Lewin. I am not sure about that.

Q.—That is your best recollection, is it not? A.—I was not a member of the committee that received applications for approval, so I just don't know.

Q.—Application for approval was not a condition precedent to getting on that approved list, was it? A.—Not this one; no.

Q.—As a matter of fact, Dr. McGovern was going out into other states to round up the list himself, was he not? A.—I don't know how to answer that, because it is not within my own knowledge.

By Mr. Lewin:

Q.—Don't the minutes on that occasion show this, Dr. Macatee?

Mr. Leahy:—What meeting?

Mr. Lewin:—July 12, 1937.

“Dr. McGovern stated that he requested the various county medical societies in Virginia and Maryland, within ten miles of the District of Columbia, to send him a list of their membership. He was not very successful by letter and intended to contact the secretary personally. He added there were a few physicians practicing medicine in the District of Columbia who were on the rolls of the Society. The Society's office was busy at the present time checking the list of physicians and surgeons as classified in the newest telephone directory and the Commission on Life Insurance has been approached to obtain a list of all associates in the District of Columbia.

Doesn't that appear? A.—It does.

Q.—Doesn't that rather indicate that the committee itself was the one that was seeking applicants for approval, for the approved list, and not waiting for applications to be made to it.

Mr. Leahy:—Objected to as argumentative.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—So, would you say now that the failure of Group Health Association to apply formally was any reason for not including it on the approved list? A.—That was still a good reason, though not the controlling reason.

Q.—What was good about it? A.—It was true.

Q.—You still say it was true, that one of the reasons for leaving Group Health off that list was because it didn't apply? A.—I said that was true. The controlling reason was we hadn't come to the point where we could approve or disapprove of it finally.

Q.—As a matter of fact, Dr. Macatee, wasn't it true that Group Health Association had made more of an application to you for that purpose than any of these other people who had been approved?

Mr. Leahy:—Objected to as argumentative.

THE COURT:—I didn't get it.

Mr. Lewin:—I asked him if Group Health Association hadn't made more of an effort to get on the approved list than these others.

THE COURT:—I think the evidence here shows what if anything they had done.

By Mr. Lewin:

Q.—Let me see if I can make this more clear. As a matter of fact, hadn't Dr. Brown said he was anxious to go along with the District Medical Society, prior to July 12, 1937? A.—That may have been one of his statements at the meeting.

Q.—And hadn't Mr. Penniman said in substance that same thing; that he was anxious to go along with the Medical Society and have your approval? A.—He may have said it.

Q.—Now, when you acted as spokesman on July 26, 1937, in the meeting with the Group Health Association trustees, I think you said that the meeting's minutes herein correctly reported that meeting, did you not; that was the meeting of July 26? A.—That statement was extemporaneous and, as transcribed, ran along with my general thought that I wished to express therein.

Q.—Didn't you say this to the Group Health trustees at that time:

"The principal difficulty that we are facing at the present time also is the knowledge of certain members of the District Medical Society have been approached with a view to serving certain organizations in a medical capacity and professional capacity"; and then, skipping a little:

"There is another provision which prohibits members of the Medical Society from lending their assistance to any corporation, group or individual under a contract until the practices and purposes of the organization have been approved by the Medical Society" et cetera.

You said that?

A.—Yes.

Q.—Wasn't this the other provision, this section 5, under which this approved list went out on July 29? A.—I don't know whether it was section 5 or section 2.

Q.—Isn't section 5 the one that prohibits members of the Medical Society from lending their services to any corporation, group or individual unless the practice and purposes have been approved? A.—Yes, that is the provision of section 5.

Q.—Then you were calling section 5 to the attention of the Group Health Association as early as July 26, 1937? A.—Yes.

Q.—You were calling their attention to it in connection with the information you had that Group Health Association was seeking a staff and had approached members of the Medical Society? A.—Obviously.

Q.—Is that right? A.—Yes.

Q.—Now, on July 27, isn't it correct, that the resolution to send the so-called white list to the members of the Medical Society of the District of Columbia was amended so that it would be sent to all the hospitals as well? A.—If the record shows so.

Q.—Aren't you familiar with that record? A.—No, not that familiar.

THE COURT:—There isn't any question about that, is there?

Mr. Leahy:—No, whatever it was; I know there was such a provision.

The Witness:—Yes, that states so in the minutes.

By Mr. Lewin:

Q.—That amendment was adopted on July 27? A.—Yes.

Q.—Now, on July 29, the so-called white list was issued for the first time? A.—I have heard evidence here to that effect.

Q.—Wasn't it sent out with two letters dated July 29, signed by the Secretary of the District Medical Society? A.—There appears to be such a letter.

Q.—And didn't the first of these letters read as follows:

"Dear Doctor:

"It may have come to your attention that there is an organization or organizations that are interested in gaining medical personnel. Your attention is called to Chapter IX, Article 4, Section 5 of the Constitution,"

quoting it in full.

Isn't that what it says? A.—Yes.

Mr. Leahy:—It says more than that.

Mr. Lewin:—Yes, it does:

"You are particularly urged to submit to the C. C. & I. N. Committee, pursuant to the Constitution, any and all contracts, written or verbal, under which you may contemplate giving your services?"

A.—It says that.

Q.—That letter which carried the white list with it refers to an organization or organizations that are interested in gaining medical personnel, does it not? A.—Yes.

Q.—Would you say that one of those organizations was Group Health Association? A.—Presumably.

Q.—So that whether it was directed to Group Health Association on July 12, or not, it was plainly directed to Group Health on July 29, 1937, the first time it went out? A.—That among others.

Q.—Now, at this very meeting on July 29, didn't you make that fact abundantly clear? Didn't you say this with regard to Group Health Association (handing witness minutes and indicating)?

"It was his impression, gained from contact with certain individuals, that they are highly intelligent people who have profoundly studied this subject, who are aware of all the social currents flowing through the country with respect to the relation of the medical profession and the people. They are aware of what has been done elsewhere and the results."

Did you say that or words to that effect? A.—My answer is that these minutes, taken down in longhand, had been shown not to express my thoughts so often that I hesitate to say they are, or that I did say that; but that was my opinion.

Q.—That was your opinion, and you have no reason to doubt you said it? A.—Correct.

Q.—When you were talking about "these people," weren't you talking about the sponsors of Group Health Association? A.—Yes.

Q.—And didn't you say:

"My feeling is that this is a group of responsible, honest, rather public-spirited people, who are undertaking to do something for the benefit of their associates in office. They are convinced and have secured what they call competent legal advice that they are on secure legal ground. They have by reason of their knowledge of similar projects elsewhere become convinced that wherever such organizations spring up they almost consistently receive the antagonism and the animosity of the local medical profession."

Didn't you say that? A.—Probably.

Q.—And when you were speaking of these "projects" weren't you referring to the Ross-Loos Clinic and other prepayment plans such as that? A.—Presumably.

Q.—Didn't you say also:

"Dr. Macatee added that he was of the opinion that their desire to avoid publicity in this matter was due to their knowledge of that fact?"

A.—Probably.

Q.—And by that didn't you mean the reluctance on the part of the Group Health people to open their doors to give you the contract with H. O. L. C. was due to the fact that they knew by reason of their knowledge of "similar projects elsewhere . . . that wherever such organizations spring up they almost consistently receive the antagonism and animosity of the local medical profession." Isn't that what you meant? A.—I think that is why they proceeded with their organization without our cooperation and advice before they asked for it.

Q.—And you seemed to feel that they were somewhat reasonable, knowing of the antagonism of the local medical society, in being a little cautious in putting all their information in your hands? A.—Yes.

Q.—Didn't you say this, following your discussion of Group Health Association, and as part and parcel of it:

"Dr. Macatee added that there is now available a list of corporations and organizations and persons employing physicians in a contractual relationship, prepared under provisions of the constitution and by-laws. He urged the members to take the list and examine it carefully and familiarize themselves with the contents."

Did you say that? A.—Yes.

Q.—And when you urged this examination of the list, and urged the members to familiarize themselves with the content, weren't you referring to this approved list issued July 29? A.—Yes.

Q.—Weren't you calling attention to its contents in connection with their attitude toward Group Health Association? A.—Yes, because the adoption of the white list had been on account of our experience in another matter, and we finished up that business in order to save us further headaches of the same sort.

Q.—Is this also the fact too: that after you talked that way, Dr. Sprigg reread a recommendation of the Executive Committee which was adopted?

Mr. Leahy:—What date is that?

Mr. Lewin:—July 29, 1937.

The Witness:—Yes.

By Mr. Lewin:

Q.—And didn't that resolution have to do with Group Health Association? A.—It did.

Q.—And then didn't the Secretary say, without any other subject matter intervening between Group Health and what he said, this:

"The Secretary stated that it was the duty of the Society's office to fulfil instructions from the Executive Committee to supply each member of the Society with a copy of the approved list that had been prepared, pursuant to Chapter IX, Article IV, Section 5 of the constitution. He pointed out that they were being mailed by registered mail. He announced that any member wishing to secure his list tonight could do so by applying at the Secretary's office and signing for same, which would aid in the distribution?"

A.—And the two statements had no connection with each other.

Q.—Although one follows the other? A.—The minutes are never subdivided to show divisions of subjects.

Q.—Was there any subject matter that intervened between the matter concerning Group Health Association and this matter? A.—Nothing appears in the minutes, but it might very well be and appear that taking up another item the Secretary said thus and so.

Q.—But you don't know about that? A.—No.

Q.—Mr. Leahy went over with you, I believe, the letter which the defendant Sprigg prepared in the fall of 1937, addressed to each one of the hospitals: am I right? A.—I can't give direct testimony about that, because I wasn't present at the meeting when this thing was discussed.

Q.—Didn't that letter start off by calling attention to this section 5?

Mr. Leahy:—The witness said he had no knowledge of it.

Mr. Lewin:—I know he said that, but the Court has indicated that we may read portions of the minutes.

THE COURT:—Yes, you may read them, but if the witness says he has no knowledge on the subject he can't testify to it.

The Witness:—If you put the letter before me I can say "I suppose that might be the letter," but I wasn't present when it was presented and considered.

By Mr. Lewin:

Q.—You were present on Nov. 3, 1937? A.—I think I was not.

Q.—Didn't you testify this morning with regard to the resolution of the defendant Willson, seconded by the defendant Christie? A.—I couldn't have testified as a direct witness, because I wasn't present on that occasion.

Q.—I ask you whether that resolution, which was certainly introduced again through your testimony, whether that resolution didn't say that the District Medical Society had an apparent means of hindering the successful operation of Group Health Association if it could prevent the doctors from being received in the local private hospitals, and then didn't the resolution refer directly to section 5, the same section adopted in March, and under which the white list went out in July? A.—I have no direct knowledge of that document; I would have to appeal to the record.

Q.—Let me come back to that meeting which you had with the Group Health trustees on July 26. You remember that? A.—Yes.

Q.—Isn't it true that at that meeting you quoted somewhat from the principles of ethics? A.—Yes.

Q.—Did you follow that up by pointing out that they might have difficulty in having and getting consultations? A.—Yes.

Q.—And didn't you point out that they might have difficulty in getting hospital accommodations, because of the principles of ethics, medical ethics? A.—I am not clear about that.

Q.—Wasn't one of the principles of medical ethics, to which you directed their attention, certain criteria for making contract practice ethical? A.—Yes.

Q.—And didn't one of them include this "free choice of physicians"? A.—Yes.

Q.—Now, isn't it true that in June 1937 the American Medical Association had amended its principles of ethics so as to include what it thought was a definition of "free choice of physicians"? A.—Yes.

Q.—And isn't it true that you failed to bring that definition to the attention of the Group Health representatives when you met with them? A.—I did fail to bring it to their attention.

Q.—Didn't you consciously fail to do so? A.—I did.

Q.—And because you wanted to withhold from them this more liberal definition of "free choice"? A.—No, the record will show that it was withheld because it was ambiguous, had just been adopted; we didn't know the purport of it.

Q.—And isn't it true that because it was ambiguous, you refrained from giving them that information? A.—I did.

Q.—But tried to leave them with the impression that this prohibition against free choice was a clear and unambiguous thing? A.—You are asking me now to recall motive?

Q.—I am asking you whether that was not your intent to withhold from them this recent amendment to the principle of free choice, and to leave them with the impression that contract practice was condemned because of a clear meaning of free choice? A.—If you want the best of my recollection I will say that I did not have any such intent, and to the best of my recollection I discovered this newly adopted item after the thing.

Q.—Dr. Macatee, weren't you present at the House of Delegates in Atlantic City in the early part of June, when this very amendment pertaining to free choice of physicians was enacted? A.—I was present at the meeting but I might not have been present at the session; more likely I was otherwise engaged at the time.

Q.—Is it your thought that you forgot this on July 26? A.—Reading back on the record, I think I forgot all about it.

Q.—But you didn't forget it on July 27, the very next day?

A.—Naturally, I would think over what I had said, trying to summarize what I had said extemporaneously and, looking over it, see what I had omitted, came across this thing and brought it to the attention of the Executive Committee.

Q.—Didn't you bring this to the attention of the Executive Committee one day after this meeting with the representatives of Group Health Association?

"Dr. Macatee, in continuing, read an excerpt from the latest issue of the principles of medical ethics of the American Medical Association, having to do with the definition of free choice of physicians, as follows:

"The 'free choice of physicians,' as applied to contract practice, is defined to mean that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patient and physician when no third person has a valid interest or intervenes. The interjection of a third party who has a valid interest or who intervenes does not per se cause the contract to be unethical."

Q.—That would apply, would it not, to Group Health Association? A.—No.

Q.—Wouldn't that have some reference to Group Health? A.—No, because the reference is to constituent or component units, local associations or societies.

Q.—Doesn't it say that the "interjection of a third person who has a valid interest between patient and physician does not per se cause the contract to be unethical"? A.—It does say so there.

Q.—And doesn't it define a "valid interest" as one where, by law or necessity, a third party is legally responsible either for cost of care or for indemnity, and doesn't it supply the definition of "intervention" as the voluntary assumption of partial or full financial responsibility for medical care? A.—It does.

Q.—And wouldn't that definition cover Group Health Association as one who intervenes? A.—Under the law of necessity?

Q.—No, not under the law of necessity. It says "voluntary assumption: voluntary assumption of partial or full financial responsibility for medical care." Wouldn't that fit Group Health Association exactly? A.—You will have to apply the definition.

Q.—And then doesn't it continue: "Intervention shall not prescribe,"—I guess that means forbid; "endeavor by component or constituent medical society,"—I guess that means members of the A. M. A., doesn't it? A.—Yes.

Q.—"To maintain high quality of service rendered by members serving under approved sickness service agreement between such societies and government boards or bureaus and approved by the respective society." A.—That is the controlling phrase there.

Q.—In other words, when the local society does it and approves it that throws out this "free choice of physicians"? A.—Yes.

Q.—You get free choice of physicians when the local society approves it, but you may not have such free choice when something like Group Health does it, is that it? A.—I will have to leave it to you to interpret.

Q.—Doesn't this follow immediately afterward:

"The ambiguity of the situation was immediately apparent.

"Dr. Macatee said that he certainly did not read this at the time of the meeting with the H. O. L. C. unit. He did, however, read on that occasion extensively from the principles of medical ethics under which the medical profession is bound, showing that the project as at present constituted could not be expected to be approved by the Medical Society of the District of Columbia, the local unit of the American Medical Association."

Is that right? A.—Yes.

Q.—So at that time you had enough information to be very definite that Group Health could not go on your approved list, didn't you? A.—That was my opinion.

Q.—And that was July 27, 1937? A.—Yes. I told them so on the 26th.

Q.—About two weeks after the white list was approved and two days before it issued? A.—That is the way the dates fall.

RE-DIRECT EXAMINATION

By Mr. Leahy:

Q.—I want to ask you to identify this letter of Nov. 21, 1938. I don't believe that was offered in evidence. I will ask you if you can identify that as one which you received from Dr. Kerr? A.—Yes.

Mr. Leahy:—This letter is Nov. 21, 1938, on the stationery of Dr. Harry Hyland Kerr, 1744 N Street Northwest, Washington, D. C.:

"DEFENDANTS' EXHIBIT 46

"Dear Dr. Macatee:

"The Senior Surgical Staff of the Garfield Memorial Hospital unanimously recommend to the Advisory Committee and to the Board that courtesy surgical privileges be denied to Dr. R. E. Selders.

"The Surgical staff believes that, though Dr. Selders has a competent post-graduate degree in Surgery, his experience has been limited to one year as resident in a non-teaching hospital in a small Massachusetts city, and is not sufficient to qualify him to take care of the surgery that may arise among 2,000 or 3,000 people.

"Sincerely yours,

H. H. Kerr
"for the Staff."

By Mr. Leahy:

Q.—Doctor, your attention was also called to a questionnaire. Do you recall that line of questions, from Dr. Warfield's committee? A.—I recall Mr. Lewin's questions regarding it.

Q.—Did you ever hear of the questionnaire from Dr. Warfield's committee before you were asked about it here? A.—No, sir.

Q.—Was any questionnaire ever received by the staff of Garfield Hospital? A.—Not to my knowledge.

Q.—Was any questionnaire ever submitted, to which answers were made, coming from that committee, to the best of your knowledge? A.—Not within my knowledge.

Q.—You were also asked with reference to certain language which was used by somebody in connection with the approval of Dr. Selders, or the attitude of Garfield Memorial Hospital toward the District Medical Society, and that answer which was stated in a letter, I think, or in a resolution to the effect that you would be aiding and abetting Group Health Association: do you recall that language; that series of questions asked on cross examination in this record? A.—No, Mr. Leahy, I don't quite get that.

Mr. Leahy:—That was contained I think in a statement which was shown you with Dr. McGovern's report or recommendation. Could I see that?

Mr. Lewin:—Yes, indeed.

Mr. Leahy:—It was admitted as U. S. 499: it is a letter from Dr. McGovern to Mr. Aspinwall, dated Sept. 17, 1937.

"The following is the recommendation of the Advisory Committee of the Medical Staff to the Board of Directors of Garfield Memorial Hospital:

"Pending the settlement of the question raised as to the ethical status of Group Health, Inc., and pending further study of the professional qualifications of Dr. Raymond E. Selders, that he be not granted courtesy staff privileges at the Garfield Memorial Hospital, except of course, in a real emergency."

"The reason prompting this recommendation is the fact that Group Health Association, Inc., a lay corporation is considered unethical by the Medical Society of the District of Columbia, and its legality is being questioned. Dr. Selders has been hired by Group Health Association as its surgeon. It is the opinion of the Advisory Committee that if the Garfield Hospital allows Dr. Selders courtesy privileges that it would be placed in the light of aiding and abetting Group Health Association, Inc."

The Witness:—I remember that letter now, yes.

Q.—Now, do you recall to what the Advisory Committee referred when it used the phrase "aiding and abetting Group Health Association"? A.—I think that answer can best be stated by the Board of Directors, acting upon that, decided that they would not admit Dr. Selders to courtesy privileges because of the alleged illegality of the outfit; and that to have done so the hospital would be put in a position of aiding and abetting an illegally operated corporation.

Q.—And is that what operated to the dictation of that letter at that time? A.—That letter could not be considered as a dictation; it was merely a recommendation to its board of directors.

Q.—You will also remember that you were asked whether or not your definition of an "emergency" had been used in other hospitals in the city. I want to ask you whether when you drew up that definition for Garfield you had in mind other hospitals in the city of Washington? A.—I had in mind nothing except that nobody would be excluded from the hospital if they came there in an emergency and were without the attendance of a doctor on the courtesy staff, so that the hospital would not be in the position of excluding anybody or being unfair or doing harm to anybody; and it would be so that everybody would be permitted to attend to a real emergency.

Q.—Did you give instructions to anybody to send out your definition of an "emergency" to the other Washington hospitals? A.—I never had any idea that it would go beyond the point of our own institution.

Q.—Do you recall whether,—and I want to see if I can straighten this out in just a minute—in the minutes of July 12, 1937. Do you recall whether Dr. Verbrycke had submitted a report while on the Economics Committee of the District Medical Society or the Chairman thereof? A.—Yes, I have seen that report somewhere. It was a number of pages, and I remember seeing it; I don't remember the contents.

Q.—June 21 was the date that was submitted, was it not? A.—I don't know.

Q.—All right, now, was Dr. Verbrycke, on July 12, in office in any committee at all in the District Medical Society? A.—He was not.

Q.—Your attention is directed now to Dr. Verbrycke's letter which was made part of these minutes. Doesn't it show and read:

"I have no longer any official status, but I am deeply interested in the entire subject, and since I was the author of the original report which has been approved by the Executive Committee, I ask your leave to submit some further thoughts with the hope that they may be of some slight help."

Is that correct? A.—Yes.

Q.—Do you recall having looked at the opening sentence of that Verbrycke letter wherein he said he had no longer any official office and his reference to the report which he says has been approved in principle by the Executive Committee? A.—Yes.

Q.—Why? A.—I thought you only asked if I remembered looking at the opening remarks in the letter.

Q.—Yes. Now, having done that, do you recall what it was that was approved by the Executive Committee? A.—He refers in his letter to his report of June 21.

Q.—Will you look to see if anywhere in the minutes you find anything indicating what action the Executive Committee took with reference to this particular letter? Kindly look at the top of page 5, and see if it refers to Dr. Verbrycke's letter. A.—I think it does.

Q.—What happened to it?

Mr. Lewin:—Is he going to read from the minutes?

The Witness:—I made a motion to the effect that the supplementary report of the subcommittee be received and be held on the table for future consideration, after the report of the subcommittee. That was seconded and adopted.

Q.—Do you recall now whether at any other time the report was ever taken off the table for action? A.—I don't recall; that is my independent memory.

Q.—Doctor, I want to ask you if there is any principle of medical ethics whatever which has anything to do with hospitals; their maintenance or their administration, so far as the medical profession is concerned.

Mr. Lewin:—Objected to. The principles of ethics are in evidence; they have been read, and speak for themselves. This is not a reference to them.

The Court:—I think so.

Mr. Leahy:—Well, I didn't want to read them again if I could avoid it.

The Court:—Well, you are not going to read them, are you?

Mr. Leahy:—No, I am not going to read them.

By Mr. Leahy:

Q.—Doctor, I want to show you the minutes of May 12, a special meeting of the Executive Committee of the Medical Society of the District of Columbia, held at half past seven in the evening. Will you kindly look at these and tell us whether or not you can recognize them as the minutes of that meeting? A.—These look like the minutes.

Q.—Do they have anybody's signature on there that you recognize? A.—That is the signature of Dr. Conklin, the secretary.

Mr. Leahy:—I want to offer in evidence these minutes of the meeting of May 12, and just read them briefly to the jury. Will you kindly mark them?

By Mr. Leahy:

Q.—Is that this white list that came out on July 12? A.—Yes.

Q.—This was May 12: Doctor, so far as you know, had anybody in the District Medical Society ever heard about G. H. A. on May 12, 1937? A.—Not to my knowledge.

Q.—Had you? A.—I had not.

Q.—Were you on the Executive Committee on May 12, 1937? A.—Yes.

"Dr. F. X. McGovern, Chairman of the Subcommittee to prepare an approved list in accordance with the provisions of Chapter IX, Article IV, Section 5 of the constitution was recognized.

"The various items were considered seriatim as follows:

"1. All member of the Medical Society of the District of Columbia.

"2. Medical staffs of all hospitals, institutions and clinics, each member of which has been approved by the Medical Society of the District of Columbia, and/or the American College of Surgeons, the American Medical Association, the American Hospital Association, in the District of Columbia or within ten miles thereof.

"It was agreed to amend recommendation No. 2 as follows:

"Medical Staffs of all hospitals, institutions and clinics, each member of which has been approved by the Medical Society of the District of Columbia."

"3. The United States Government, medical personnel on duty in the District of Columbia or within ten miles thereof, namely, i. e., the United States Army, Navy, Public Health Service, and the Veterans Administration.

"4. The Health Officer and attached medical personnel.

"5. Membership of the District Medical Society.

"6. Membership of the Homeopathic Medical Society.

"7. Members of the Montgomery County (Md.), Prince Georges County (Md.), Fairfax County (Va.) and Arlington County (Va.) medical societies, who reside within ten miles of the District of Columbia.

"8. Members of the Alexandria Medical Society.

"9. The following compensation clinics.

"1. Washington Industrial Accident Clinic.

"2. Washington Medical Building Workmen's Clinic.

"3. Northwest Insurance Clinic.

"4. Union Market Workmen's Compensation Clinic.

"5. Market Compensation Accident Clinic.
"6. Washington Compensation Accident Clinic.
"7. Washington Insurance Clinic.
"8. Harry M. Lewis Clinic.
"9. First Aid Station.
"Discussion on the recommendation No. 9 was participated in after the reading of the other reports.
"10. All medical personnel connected with the Federal or municipal government within the District of Columbia or within ten miles thereof."
"Dr. Daniel Borden was of the opinion that this should not be included.
"Others could see no objection to this subdivision.
"11. Membership of the Medico-Chirurgical (Colored Medical Society).
"12. Membership of the Robert T. Freeman Dental Society (Colored Dental Society). In the consideration of item 9, Dr. W. M. Sprigg stated he thought the clinic should be listed temporarily."

By Mr. Leahy:

Q.—Now, Doctor, these clinics, they appear in the approved list of July 12? A.—I think so.

Q.—Were these clinics of long standing in the District of Columbia or otherwise? A.—Ever since the passage of the industrial compensation law.

Q.—And had they or had they not, those clinics, been before the District Medical Society on their purpose, maintenance and operation been or been not approved? A.—They had been.

Q.—The others mentioned in the approved list refer to just what the list states, the hospitals, et cetera, in the District of Columbia, and their staffs, and those within ten miles of the District. I am not going to take the time to read, refer back to the minutes of July 12, but I ask you, Wasn't it then and there stated that that list was incomplete, that this was not a complete list? A.—It was.

Q.—As a matter of fact, was the Washington Sanitarium in Takoma Park on that list? A.—It was not.

Q.—Were there doctors practicing here in the District of Columbia who were not on that list? A.—Many.

Q.—Did it or did it not purport to be a complete list? A.—It did not purport to be a complete list.

Q.—And whether G. H. A. discovered that the Principles of Medical Ethics of the American Medical Association had been amended in June meeting of 1937, or not, did G. H. A. ever seek approval of the Medical Society?

Mr. Lewin:—Wait a minute; that calls for a conclusion.

THE COURT:—You mean did G. H. A. ever formally ask approval?

Mr. Leahy:—Yes.

THE COURT:—If you want to ask him whether they ever made formal application, he may answer that.

By Mr. Leahy:

Q.—I will adopt the Court's question. Did the G. H. A. ever make to the District of Columbia Medical Society a formal application for approval? A.—It never did.

Q.—There is one other thing. Under cross-examination you had your attention directed to the minutes of July 29. You made some answer in substance in effect to the end that the minutes had no subdivisions as to topics. Do you recall that. A.—I do.

Q.—And your attention was directed to the reading of one entry which follows another entry in those minutes? A.—I recollect that.

Q.—And your attention was directed to the minute with the statement that there was no information intervening between these minutes. I will ask you if the minutes show a line between those paragraphs, showing that there was something transpired in there? A.—There is a line indicating a division; a typed line.

Mr. Lewin:—Wait a minute. What is that?

Mr. Leahy:—A typed line.

Mr. Lewin:—Is there any subject matter or discussion that appears between the resolution with regard to Group Health and this statement of the secretary?

THE COURT:—Let the jury see it.

Mr. Leahy:—Yes. Let it be passed to the jury so they may see it.

(Thereupon the minutes were passed among the jurors for inspection.)

THE COURT:—Is that all?

Mr. Leahy:—Yes. And I ask the same permission with respect to these minutes. If the jury will also look at the other pages to see where the breakdown comes.

Mr. Lewin:—There is another page in the minutes I would like the jury to look at also.

THE COURT:—Yes, you may do that.

Mr. Lewin:—I would like the jury to consider these three paragraphs on this page, particularly the third one.

Mr. Leahy:—You mean read them over?

Mr. Lewin:—I would like to have them look over this statement of Dr. Macatee, and the subject matter of this here (indicating).

(To be continued)

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Change in Status.—S. 1230, the hospital construction bill, has been referred to a subcommittee of the Senate Committee on Education and Labor for consideration. The following Senators compose the subcommittee: James E. Murray, Montana; Allen J. Ellender, Louisiana; Berkeley L. Bunker, Nevada; Robert M. LaFollette Jr., Wisconsin, and Robert A. Taft, Ohio. It is understood that a hearing on the bill is contemplated, but no date has been set.

STATE MEDICAL LEGISLATION

Connecticut

Bills Introduced.—S. 1032 and H. 2400, to amend the laws relating to the practice of chiropractic, propose that "Chiropractic physicians shall be subject to the rules and regulations that govern other physicians in the making and filing of certificates of death." S. 2347 and H. 1588 propose that a hospital maintaining ambulance service must render such service to any person without regard to financial ability to pay, "the actual need for the ambulance to be determinative." The bill proposes that a hospital maintaining such a service must keep a qualified driver on its premises or in the immediate vicinity at all times. H. 1814 proposes that, if it appears necessary to the coroner or to the medical examiner to have a chemical or microscopic analysis or other scientific investigation made for the purpose of ascertaining the cause of death of the person on whose body he is holding an inquest, he shall report to the state's attorney, who shall order such analysis or investigation to be made at state expense by the state health department laboratory or a laboratory certified by the state health department.

Massachusetts

Bill Introduced.—H. 2301 proposes to authorize the formation of medical service corporations to operate nonprofit medical service plans whereby the cost of medical service furnished to subscribers to said plan and their dependents is paid for by the corporation to physicians agreeing to render such services.

Minnesota

Bill Introduced.—S. 1383 memorializes the governor to request the state medical association and the state bar association to study the Minnesota laws relating to the commitment of mentally defective and deficient persons and to report their findings and recommendations to the next session of the legislature.

Pennsylvania

Bills Introduced.—S. 480 proposes to require the department of health to furnish all state and state-aided hospitals free of charge the vaccines and serums used in the Pasteur treatment of persons bitten by dogs. The hospitals concerned are to furnish and inoculate free of charge all persons bitten by dogs in the commonwealth with such serum or vaccine. H. Res. 57 proposes to authorize the speakers of the house of representatives and of the senate to appoint a joint committee to investigate the maintenance, operation and conduct of all state hospitals in the commonwealth. H. 1048 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic. The bill states that "Chiropractic is the examination of the human spine by observation, palpation or x-ray and the adjustment of any or all misalignments of vertebrae or adjacent bones or tissues through

the use of the hands." H. 1094 proposes to require the registration with and the securing of permits from the state board of pharmacy by persons, copartnerships, associations and corporations engaged in the manufacture, producing and dealing in drugs and medical supplies. H. 1099 proposes a procedure for the reimbursement by the state of hospitals treating indigent persons injured in motor vehicle accidents. H. 1118 proposes to enact a separate chiropody practice act and to create an independent board of *chiropody examiners to examine and license applicants for licenses to practice chiropody*. The bill defines chiropody as "the diagnosis of foot ailments and the

practice of minor surgery upon the foot limited to those structures of the foot superficial to the inner layer of facie of the foot, the palliative and mechanical treatment of deformities and functional disturbances of the feet and the making of models of the foot and toes or any one or more of such activities." The bill proposes that chiropody is not to include treatment of communicable or constitutional diseases of the bones, ligaments or muscles of the feet or the performance of any operation on the bones, ligaments, muscles or tendons of the feet involving the use of any cutting instrument or the use of any anesthetic other than local.

OFFICIAL NOTES

RADIO BROADCASTS

The next three programs to be broadcast in the series "Doctors at Work" are as follows:

- April 23. The Big Red Schoolhouse.
- April 30. Baby's Birthright.¹
- May 7. So Mothers May Live.¹

1. This program will be broadcast at 10:30 eastern daylight saving (9:30 eastern standard) time (9:30 Chicago daylight saving, 8:30 central standard, 7:30 mountain standard, 6:30 Pacific standard time).

The program is scheduled over the Blue network of the National Broadcasting Company Wednesdays at 10:30 p. m. eastern standard time (9:30 central, 8:30 mountain, 7:30 Pacific time).

Verify the time by reference to local newspapers.

Tickets are available for each broadcast. Address the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Tickets are free, but a stamped, self-addressed envelop should accompany requests.

WOMAN'S AUXILIARY

Florida

A joint meeting of the state auxiliary board and the state advisory committee was held at Daytona Beach recently. Mrs. Gordon H. Ira, president, presided. Dr. J. Sam Turberville, president of the Florida Medical Association, was guest speaker. Dr. Gordon H. Ira, chairman of the association's advisory committee, also addressed the meeting.

Illinois

The Aux Plaines branch met recently. Twenty-two new members were reported and thirty-two prospects. Seventy-five dollars was voted for *Hygeia* subscriptions. Dr. Frederick Falk spoke on "Maternal Welfare."

The Will-Grundy County auxiliary met in the home of Dr. and Mrs. W. C. McSweeney in Joliet, recently with twenty members present. Sister Hilda of St. Joseph's Hospital spoke on hospital routine and management. Mrs. Harry Dooley, president of the state auxiliary, discussed the "Benevolence Fund."

The first regular board meeting of the year was held at the Palmer House in Chicago, November 9. The president, Mrs. Harry Dooley, presided and thirty members were present. Mrs. V. E. Holcombe, national president, was the honored guest. In her address she stressed, in addition to *Hygeia*, the national publication, the *Bulletin*, the membership drive and the Benevolence Fund. Mrs. Holcombe stressed the importance of carrying out the objectives for the year. The president-elect, Mrs. Harry Otten, described problems encountered in forming new county auxiliaries. Mrs. H. B. Henkel, chairman of the Committee on the Benevolence Fund, explained the objectives of the fund. Mrs. E. M. Egan, chairman of the Hygeia committee, told of the drive for subscriptions.

Iowa

The Woman's Auxiliary to the Dallas-Guthrie Medical Society met recently at Panoca. Mrs. E. T. Warren, state president, discussed national auxiliary news, with emphasis on the national organ, the *Bulletin*. Mrs. C. R. Osborn was appointed to report on all legislation of interest to the medical profession at the January meeting.

A social sponsored by the Woman's Auxiliary to the Polk County Medical Society was held at the Des Moines Club, recently. About 175 physicians and their wives were present; music was furnished by talent from Drake University.

Members of the Woman's Auxiliary to the Pottawattamie County Medical Society met in Council Bluffs recently. Mrs.

E. T. Warren, state president, was guest speaker. It was announced that members would sew for the Red Cross once a month. Preparations were made to distribute Christmas baskets and clothing to two needy families. The program consisted of talks on the "Cause, Results and Treatment of Poliomyelitis," by Mrs. Grant Augustine and Mrs. Isaac Sternhill.

Texas

The Dallas County auxiliary was active during the past summer assisting the Red Cross. A request for help was responded to by 50 per cent of the members of the auxiliary. One full class and another half class of wives of physicians took the summer course in bandage rolling and made numerous articles of clothing. The auxiliary also contributed \$50 to the Red Cross fund. Auxiliary members taught a six weeks' course in home hygiene. The auxiliary will sponsor, in conjunction with the Dallas County Medical Society, an educational medical booth at the state fair. The exhibit material is being sent by the American Medical Association and the booth will be in charge of the Hygeia committee of the auxiliary.

At a recent meeting of the auxiliary to the Johnson County Medical Society Mrs. S. H. Watson, Waxahachie, past president of the state auxiliary, spoke on "Ethics for Doctors' Wives." Mrs. Watson is a member of the national auxiliary board and chairman of archives.

At a recent meeting of the auxiliary to the Kerr-Kendall-Gillespie-Bandera Counties Medical Society twenty-seven members and one guest were present. Yearbooks were issued and a preview of the year's work was presented by the president. The auxiliary voted to sponsor the state health essay contest in Gillespie County schools and to give prizes.

The officers of the Harris County auxiliary honored twenty-eight new members at a tea in September at the River Oaks Country Club in Houston.

The auxiliary to the Nalan-Fisher-Mitchell Counties Medical Society was organized recently at a meeting in Sweetwater.

The Washington County auxiliary held a meeting recently at which Mrs. A. H. Sinclair read a paper on "The American Medical Association Program."

The auxiliary to the Northeast Texas (Fifteenth) District Medical Society met recently in Texarkana. Speakers included Mrs. William Hibbits, president of the state auxiliary; Mrs. L. H. Lanier, president-elect of the Bowie-Miller auxiliary and Mrs. M. J. Johnson, vice president of the district auxiliary.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Flower Show.—The Los Angeles County Medical Association held its first spring flower show in the lounge of the association building April 16-17. The exhibit, which was open only to physician members of the association, was in charge of a committee composed of Drs. Samuel Ayres Jr., chairman, Robert B. Hope and Albert G. Bower, cooperating with Mr. Fred T. Bergstrom, horticulturist. A separate section in the display, devoted to flower arrangement, was open to members of the association, their wives and members of their office personnel. Prizes and ribbons were awarded.

Society News.—Dr. Morris Fishbein, Chicago, Editor of THE JOURNAL, will discuss "American Medicine on Trial" before the San Francisco County Medical Society, April 22. —The Los Angeles Surgical Society devoted its March 14 meeting to a panel discussion on acute perforated appendicitis with Dr. Verne C. Hunt as the moderator; the speakers were Drs. James Norton Nichols, E. Eric Larson and Hans E. Schiffbauer. —Hubert Scott Loring, Ph.D., assistant professor of biochemistry, Stanford University School of Medicine, San Francisco, discussed "Purified Viruses" before the Hollywood Academy of Medicine, March 13.

California Needs Interns.—The California State Personnel Board announces examinations for student and senior interns to fill current vacancies at various state institutions. Applications may be filed at any time during 1941 and will be rated as soon as they are received by the state personnel board. If a candidate's rating on education, experience and fitness is high enough to qualify him, his name will immediately be placed on the eligible list in accordance with his rating. The one year California residence requirement has been waived for these examinations. For senior intern the entrance salary will be \$50 a month and maintenance for self and family. For student intern \$25 a month and maintenance will be allowed.

COLORADO

Personal.—Dr. Millard F. Schafer, who just completed a postgraduate course at the University of Michigan, Ann Arbor, has been designated director of the city-county health unit of Colorado Springs and El Paso County succeeding Dr. Thomas D. Menser, who resigned to enter private practice in Trinidad.

Annual Spring Clinic.—The Mesa County Medical Society conducted its fourth annual spring clinic at the La Court Hotel, Grand Junction, April 6. Speakers included:

- Dr. Harry C. Hughes, Denver, Common Disorders of the Feet.
- Dr. Thomas E. Carmody, Denver, Some of the Newer Methods of Treating Sinus Pathology.
- Dr. Lyman W. Mason, Denver, Use and Abuse of "Sex" Hormones.
- Dr. Kenneth C. Sawyer, Denver, Surgery of the Biliary Tract.
- Dr. Alfred C. Callister, Salt Lake City, Plastic Surgery of Special Interest to the General Practitioner.
- Dr. George A. Unfug, Pueblo, X-Ray Differentiation of Gastric Carcinoma and Peptic Ulcer.
- Dr. William R. Tyndale, Salt Lake City, Practical Vitamin Therapy.

DISTRICT OF COLUMBIA

Annual Meeting of Hospital Society.—The fourth annual meeting of the Medical Society of St. Elizabeths Hospital will be held in Washington on April 26. Sir Willmott Lewis, Washington correspondent of the London Times, will be the principal speaker at the banquet.

Lectures on Psychoneurosis.—A course in psychoneuroses in general practice, consisting of two lectures, will be offered by the committee on postgraduate education of the Medical Society of the District of Columbia, Washington. Dr. Walter C. Alvarez, Rochester, Minn., will speak, April 21, on "Differential Diagnosis of Psychoneuroses" and Dr. Leslie B. Hohman, Baltimore, April 28, on "General Management of Psychoneuroses." A course in office surgical procedures was conducted March 17 and 24 with Drs. William Wayne Babcock, Philadelphia, discussing "General Surgery" and Isidor C. Rubin, New York, "Gynecologic and Genitourinary Surgery."

Personal.—Col. Harold W. Jones, M. C., U. S. Army, librarian of the Army Medical Library, gave the annual address before the Osler Historical Club of the Medical and Surgical Faculty of Maryland, March 11, in Baltimore. The subject of the address was "Medical Research and the Microfilm." —Harold H. Lund, former assistant to the director of alien registration for the Department of Justice, has been named managing director of the District of Columbia Tuberculosis Association. Mr. Lund for several years directed publicity for the Institute of Human Relations at Yale University School of Medicine, New Haven; he was also assistant research director of the White House Conference on Children in a Democracy in 1939.

IDAHO

Chief of Staff Twenty-One Years.—Dr. James L. S. Stewart was guest of honor at a dinner at St. Luke's Hospital, Boise, March 18, in recognition of his twenty-one years of service to the hospital as chief of staff. Dr. Stewart was the first to occupy the position, holding it continuously from 1920 until 1941. At the recent dinner he was made president emeritus of the staff and was presented with a wrist watch.

ILLINOIS

Birth Control League Changes Name.—The Illinois League for Planned Parenthood has been organized to replace the Illinois Birth Control League, newspapers announced, March 11. The adoption of a new name initiated an extension of educational and clinical programs throughout the state, it was said. Mrs. Stanley G. Harris, Chicago, is president. The newly organized group will continue supervision and aid of clinics already founded in eleven cities of the state by the Illinois Birth Control League. Eight of the clinics are in Chicago and others are in Alton, Centralia, Springfield, Champaign, Chicago Heights, Danville, Downers Grove, Evanston, Peoria and Springfield.

Chicago

Course on Toxicology.—The University of Chicago will offer a course on "Toxicology and the National Defense" during the quarter opening June 24, covering special hazards resulting from increased industrial production in connection with defense and with dangers of poisoning in actual warfare. Dr. Eugene M. K. Geiling, professor and chairman of the department of pharmacology, will direct the course.

Universities Cooperate in Symposium.—The University of Chicago and the University of Wisconsin have organized a joint symposium on the respiratory enzymes and the biologic action of the vitamins. The Wisconsin sessions, devoted to the respiratory enzymes, are planned for September 11-13. The meetings dealing with the vitamins will take place in Chicago on September 15-17, forming a part of the semicentennial celebration at the University of Chicago. The program is an attempt to coordinate the biologic action of the vitamins and the respiratory enzymes. The symposium is supported by the Wisconsin Alumni Foundation for the University of Wisconsin and by the Abbott Laboratories for the University of Chicago. Complete details may be obtained from Conrad A. Elvehjem, Ph.D., University of Wisconsin, Madison, or from Thorfin R. Hogness, Ph.D., University of Chicago.

INDIANA

Graduate Course.—The ninth annual postgraduate course at Indiana University School of Medicine, Indianapolis, will be held April 28-May 2. Clinics and round table discussions will make up the morning sessions while the afternoon periods will be given over to clinicopathologic conferences and didactic lectures. Participating will be:

- Dr. Louis Schwartz, director, Office of Dermatitis Investigation, U. S. Public Health Service, Washington, D. C.
- Dr. Howard Burnham Sprague, instructor in medicine, Harvard Medical School, Boston.
- Dr. Andrew C. Ivy, Nathan Smith Davis professor of physiology and professor of pharmacology, Northwestern University Medical School, Chicago.
- Dr. Robert C. Jamieson, professor of dermatology and syphilology, Wayne University College of Medicine, Detroit.
- Dr. Walter M. Boothby, professor of medicine and biochemistry, University of Minnesota Graduate School of Medicine, Rochester, Minn.

Society News.—Dr. Philip Lewin, Chicago, discussed "Low Back Pain and Sciatica" before the Fort Wayne Medical Society, Fort Wayne, March 18. —The Delaware-Blackford Counties Medical Society was addressed in Muncie, March 18, by Drs. Ramon A. Henderson and Gerald S. Young, Muncie, on "Treatment of the Acute Exanthemata." —Dr. George S. Bond, Indianapolis, addressed the Gibson County Medical

Society in Princeton, March 10, on "Hypertension: Clinical Symptoms and Treatment."—The Randolph County Medical Society was addressed in Winchester, March 10, by Mr. Howard Henderson of the American Hospital Supply Corporation; his subject was "Some Practical Aspects of Fluid Administration, Blood Transfusions, Blood Banks, Plasma Fusion and Plasma Banks."—Dr. Percy E. McCown, Indianapolis, discussed "Etiology and Treatment of Renal and Ureteral Calculi" before the Greene County Medical Society in Linton, March 13.—Prof. Henrik Dam, Biochemical Institute, University of Copenhagen, lectured recently at the Indiana University Medical Center, Indianapolis, on "Factors in Preventing the Blood from Leaving the Vascular System."—Dr. Wilson G. Smillie, New York, addressed a joint meeting of the Indianapolis Medical Society with the Dental and Dietetics Association, March 18, on "Education in Nutrition: Whose Responsibility?"

MARYLAND

De Lamar Lectures.—Dr. Charles N. Leach, Montgomery, Ala., of the staff of the International Health Division of the Rockefeller Foundation, gave the last in the recent series of De Lamar Lectures, March 18, at Johns Hopkins University School of Hygiene and Public Health, Baltimore. His subject was "Recent Studies on the Epidemiology and Control of Rabies." Other lecturers in the series were:

Dr. Virgil P. W. Sydenstricker, professor of medicine, University of Georgia School of Medicine, Augusta, Dietary Problems of the Southern United States.

Otto A. Bessey, Ph.D., associate in biologic chemistry and research fellow in pathology, Harvard Medical School, Boston, Morphological and Biochemical Defects in the Dietary Deficiency States.

George R. Cowgill, Ph.D., associate professor of physiologic chemistry, Yale University School of Medicine, New Haven, Conn., Nutritional Problems in Tropical America.

Dr. Edward H. Hatton, professor of pathology and bacteriology, Northwestern University Dental School, Chicago, Etiology of Dental Caries.

Dr. Max Theiler, Laboratories of the International Health Division, Rockefeller Foundation, New York, Studies on Poliomyelitis.

MASSACHUSETTS

Course on Industrial Hygiene.—The lecture and laboratory courses in industrial hygiene, ordinarily given in the academic year at the Harvard School of Public Health, Boston, will be offered in a special summer course running from May 1 through July. This change was made to meet the demand of the government services and of the defense industries for physicians and engineers trained in industrial hygiene. Details may be secured from the Secretary of the Harvard School of Public Health, 55 Shattuck Street, Boston.

Bust of Dr. Tyzzer.—A bronze bust of Dr. Ernest E. Tyzzer, George Fabyan professor of comparative pathology and professor of tropical medicine, Harvard Medical School, Boston, was recently presented to Dr. Tyzzer to be placed in his department. Dr. Cecil K. Drinker made the presentation at a luncheon honoring Dr. Tyzzer for his long service to the university. The bust was executed by Dr. Edward G. Deming, Detroit, a recent graduate of Harvard. Dr. Tyzzer graduated at Harvard in 1902 and joined the faculty the following year.

Society News.—The Boston Medical History Club was addressed, March 27, by James Walter Wilson, Ph.D., Brown University, Providence, R. I., on "Role of Art in Development of the Natural Sciences in the Renaissance."—Dr. Allen O. Whipple, New York, gave the third in a series of four Robert Dawson Evans Memorial lectures, March 28, in the Evans Auditorium, Boston, on certain splenopathies in relation to the vascular bed of the spleen.—Drs. Stanley Cobb and Mandel E. Cohen, Boston, among others, addressed the Massachusetts Psychiatric Society in Boston March 28 on "Anticonvulsive Action of Neoprontosil."

MICHIGAN

State Society Officers Re-elected.—At the recent annual session of the council of the Michigan State Medical Society the following officers were reelected to their respective positions: Drs. William A. Hyland, Grand Rapids, treasurer; L. Fernald Foster, Bay City, secretary; Roy Herbert Holmes, Muskegon, editor, and Mr. William J. Burns, executive secretary.

Meeting of Physicians and Druggists.—Dr. Virgil E. Simpson, clinical professor of medicine, University of Louisville School of Medicine, Louisville, Ky., was the principal speaker at a joint meeting of the Detroit Retail Druggists

Association and the Wayne County Medical Society, Detroit, March 10. His subject was "The Physician, the Pharmacist and the Pharmacopeia."

Medical Services Observe Anniversaries.—A banquet was held at the Statler Hotel, Detroit, March 26, to mark the first anniversary of Michigan Medical Service and the second anniversary of Michigan Hospital Service. The speakers were Alphonse M. Schwittalla, S.J., dean, St. Louis University School of Medicine, St. Louis, and Mr. James A. Hamilton, superintendent of the New Haven Hospital, New Haven, Conn., on medical economics.

Field Consultant in Obstetrics.—Dr. Russell R. de Alvarez, Ann Arbor, who has been conducting postgraduate courses in obstetrics for the Michigan State Department of Health, has been appointed field consultant in obstetrics for the department. He succeeds Dr. Clair E. Folsome, Ann Arbor, who resigned to become executive director of the National Committee on Maternal Health, Inc., in New York. Dr. de Alvarez graduated at the University of Michigan Medical School, Ann Arbor, in 1935.

MINNESOTA

Abortionist Sentenced.—Dr. Samuel R. Fraker, Minneapolis, pleaded guilty in the district court of Hennepin County to a charge of abortion, February 21. He was sentenced to a term of not to exceed four years in the state prison at Stillwater. The sentence was suspended on Dr. Fraker's plea that he was suffering from pernicious anemia and that he desired an opportunity to live with his daughter in another state. The plea was granted and the sentence was suspended for three years. In 1938 Dr. Fraker's license had been revoked for three years on a similar charge.

MISSISSIPPI

New Health Officials.—Dr. Maude M. Gerdes, formerly consultant in obstetrics for the Children's Bureau, Washington, D. C., has been appointed director of maternal and child health of the Mississippi State Board of Health at Jackson, it is reported.—Dr. William David May, formerly of Durant, has been appointed director of the state health department personnel training center at the Lauderdale County health department. He succeeds Dr. Robert L. Simmons, who has been made director of the Pearl River County health department in Poplarville.

MISSOURI

Society News.—Dr. John H. Peck, Oakdale, Iowa, discussed modern methods in the diagnosis and treatment of pulmonary tuberculosis before the St. Louis Medical Society, April 8, under the auspices of the St. Louis Trudeau Club. Dr. Fred T. Murphy, Grosse Pointe, Mich., presented "Reminiscences and Experiences in Military Medicine (France 1917-1918, Base Hospital Unit 21)" before the society, April 15.—Halsey J. Bagg, Ph.D., New York, discussed "Advances in the Experimental Study of Malignant Disease" before the Kansas City Academy of Medicine, April 18.

State Medical Meeting.—The eighty-fourth annual session of the Missouri State Medical Association will be at the Jefferson Hotel, St. Louis, April 28-30, under the presidency of Dr. Cyrus E. Burford, St. Louis. Out of state speakers will include:

- Dr. Russell L. Cecil, New York, Treatment of Chronic Arthritis.
- Dr. Roy Glenn Spurling, Louisville, Herniated Nucleus Pulposus.
- Dr. Clyde L. Deming, New Haven, Conn., Relation of Hypertension to Renal Disease.
- Dr. Meyer Bodansky, Galveston, Texas, Use of Laboratory Data in Clinical Medicine.
- Dr. Paul B. Magnuson, Chicago, Differential Diagnosis of Conditions Causing Pain in the Lower Back.
- Dr. Jean M. Stevenson, Cincinnati, Surgical Care of Fresh Traumatic Wounds.
- Dr. Samuel A. Cosgrove, Jersey City, N. J., Management of Abruptio Placentae.
- Dr. Walter C. Alvarez, Rochester, Minn., What Is the Matter with the Patient Who Is Always Tired?
- Dr. Lawrence S. Fallis, Detroit, Diagnosis and Treatment of Common Anorectal Diseases.
- Dr. Abraham E. Bennett, Omaha, Modern Treatment of the Mentally Ill.
- Dr. Harrison F. Flippin, Philadelphia, Cardinal Principles of Sulfonamide Therapy.

Missouri physicians on the program include Drs. Robert W. Bartlett, St. Louis, on "Practical Lessons Learned from a Fifteen Year Mortality Study in Toxic Goiter"; John F. Hardesty, St. Louis, "Survey of Persons Receiving Blind Pensions in Missouri from 1923 to 1940"; Willard M. Allen, St. Louis,

"Clinical Use of the Sex Hormones"; Hurley L. Motley, Columbia, "A Simple Qualitative Test for Differentiating Between the Common Sedative Drugs."

NEBRASKA

State Medical Meeting at Lincoln.—The annual assembly of the Nebraska State Medical Association will be held at the Hotel Cornhusker, Lincoln, May 5-8, under the presidency of Dr. Clayton F. Andrews, Lincoln. Guest speakers will include:

- Dr. Harry S. Gradle, Chicago, Prevention of Blindness.
- Dr. Alexander E. Brown, Rochester, Minn., Practical Considerations in Sulfamido Therapy.
- Dr. M. Herbert Barker, Chicago, Hypertension and Its Management; also High Points of Renal Edema and Their Management.
- Dr. Raymond W. McNealy, Chicago, Perforation of Peptic Ulcer; also Treatment of the Acute Gallbladder.
- Dr. Thomas K. Brown, St. Louis, Treatment of Gonococcal Vaginitis; also Postpartum and Postabortal Infections of the Uterus.
- Dr. Samuel W. Becker, Chicago, Dermatologic Fashions; also Diagnosis and Treatment of Vesicular Eruptions of the Hands and Feet.
- Dr. Roland P. Mackay, Chicago, Newer Methods of Treating Acute Meningitis; also Indispensable Neurologic Tests.
- Dr. Arthur E. Hertzler, Halstead, Kan., Recent Studies in the Surgery of Goiter; also Lumbago.
- Dr. Albert V. Stoesser, Minneapolis, Chemotherapy in Pneumonia; also Preventive Allergy—A New Therapy.
- Dr. Carl F. Rusche, Los Angeles, Calculous Disease of the Upper Urinary Tract.

Dr. Roscoe L. Sensenich, South Bend, Ind., will be the speaker at a dinner Tuesday evening, May 6. The annual banquet will be Wednesday evening. The golf tournament will be held Monday, May 5, at the Lincoln Country Club.

NEW YORK

State Medical Meeting in Buffalo.—The annual meeting of the Medical Society of the State of New York will be held at the Hotel Statler, Buffalo, April 28 to May 1, under the presidency of Dr. James M. Flynn, Rochester. There will be two general sessions at which symposiums will be presented. Speakers in a symposium on "Psychosomatic Problems" will be Drs. Bernard Glueck, Ossining; Edwin J. Doty, George Eaton Daniels and Foster Kennedy, New York. Dr. Kennedy's address on "Medicine and Mental Symptoms" will be the A. Walter Suiter Lecture. In a symposium on "Trauma—Its Early Treatment" speakers will be Drs. Fred W. Geib, Rochester; Eli Jefferson Browder, Brooklyn, and Fenwick Beckman, New York. Guest speakers to address sections include:

- Dr. Henry Field Smyth, Philadelphia, Clinical Considerations of Poisonings by Some of the Chlorinated Hydrocarbons.
- Dr. Abrie L. Brooks, Detroit, Solvent Exposures—Petroleum Distillates.
- Dr. Clarence D. Selby, Detroit, New Medical Opportunities in National Defense.
- Dr. Frederick A. Willis, Rochester, Minn., Principles Underlying the Treatment and Management of Coronary Disease.
- Dr. Fred L. Adair, Chicago, Streptococcal Puerperal Infections.
- Dr. Winthrop M. Phelps, Baltimore, Differential Characteristics of Spasticity and Athetosis in Relation to Therapeutic Measures.
- Dr. Priscilla White, Boston, Management of the Diabetic Child.
- Dr. George J. Thomas, Pittsburgh, Prevention of Explosions of Anesthetic Mixtures by the Addition of Helium.
- Dr. Joseph M. Hill, Dallas, Texas, Preparation and Use of Desiccated Plasma by Mass Production Methods and Its Importance in Routine and Military Surgery.
- Dr. Reed M. Nesbit, Ann Arbor, Mich., Chronic Pylonephritis, An Incurable Disease—Importance of Prevention.
- James B. Hamilton, Ph.D., New Haven, Conn., Effects and Clinical Use of Male Hormone Substances.
- Dr. George P. Miley, Philadelphia, Ultraviolet Irradiation of Auto-transfused Blood in the Treatment of Acute Pyogenic Infections.
- Dr. Donald Guthrie, Sayre, Pa., summation of a symposium on surgical treatment of goiter.

The section on public health, hygiene and sanitation will have a symposium on "Medical Problems in National Defense" with the following speakers: Col. Charles M. Watson, M. C., U. S. Army; Drs. Albert E. Russell, U. S. Public Health Service; Vivian A. Van Volkenburgh, state health department, Albany, and John D. Naples, Buffalo.

New York City

Alumni Day at Long Island College.—The Alumni Day of Long Island College of Medicine will be celebrated, April 26, at the college. Following round table discussions, addresses will be made by Drs. William P. Healy on "Pelvic Malignancies" and Frank E. Adair, "The Place of the Radiation Program in the Field of Mammary Carcinoma." At a luncheon Dr. Perry M. Lichtenstein will speak on "Psychopathic Criminals." The annual banquet will take place at the Knights of Columbus Club in Brooklyn, with the Hon. William O'Dwyer, district attorney of Kings County, as the speaker.

Therapeutic Reviews.—The Medical Society of the County of Kings is sponsoring round table therapeutic reviews on Monday afternoons. A specialist in the subject assigned for discussion presides over each conference. Members are asked to submit their questions before the day of the meeting. The series is as follows:

- Dr. Edwin P. Maynard Jr., Brooklyn, Treatment of Angina Pectoris and Coronary Thrombosis, March 17.
- Dr. John H. Crawford, Brooklyn, Treatment of Congestive Heart Failure, March 24.
- Dr. Joseph C. G. Regan, Brooklyn, Sera and Vaccines in the Prevention and Treatment of Contagious and Infectious Diseases, March 31.
- Dr. Matthew Walzer, Brooklyn, Treatment of Hay Fever and Asthma, April 7.
- Dr. Fedor L. Senger, Brooklyn, Treatment of Infections of the Urinary Tract, April 14.
- Dr. Marion B. Sulzberger, New York, Treatment of the More Common Skin Diseases, April 21.
- Dr. Charles Solomon, Brooklyn, Use and Abuse of Hypnotics and Sedatives, April 28.

Society News.—Drs. Nathan B. Van Etten, President of the American Medical Association, and Reed M. Nesbit, Ann Arbor, Mich., addressed the Medical Society of the County of Kings, March 18, on "American Health and National Defense" and "The Selection of Operation for Prostatic Obstruction" respectively.—Dr. Samuel L. Siegler, Brooklyn, gave an afternoon lecture before the Medical Society of the County of Queens, March 21, on "Diagnostic and Therapeutic Aspects of Sterility."—Dr. Albert A. Cinelli addressed the Spanish American Medical Society, March 4, on "Nasal Obstructions."—A symposium on "Current Concepts Regarding Benign Lesions of the Small Intestine" was presented at a stated meeting of the New York Academy of Medicine, March 6, by Drs. Claude F. Dixon, Rochester, Minn., who discussed the surgical aspects; Ross Golden and Burrill B. Crohn, roentgenologic and medical aspects, respectively.—Speakers before the New York Society for Clinical Ophthalmology, March 3, included Drs. Milton C. Peterson on "General Anesthesia in Ophthalmology"; Vito La Rocca, "Treatment of Vernal Catarrh with Dry Ice," and David J. Morgenstern, "Dacryocystorhinotomy, An Office Procedure."

OHIO

Personal.—Dr. Clarence A. Mills, Cincinnati, went to Panama in February to continue work begun last year on the effects of tropical climates on mankind. He was to work at the Gorgas Memorial Institute, Panama, C. Z.—Dr. William M. German, pathologist at the Good Samaritan Hospital, Cincinnati, has been invited to conduct a three months course in pathology at the University of Bogotá, Colombia, it is reported. He was to sail from New York on April 11.

Society News.—Dr. Frank N. Allan, Boston, addressed the Academy of Medicine of Cincinnati, March 25, on "Problems in the Use of Insulin in Diabetes Mellitus." Dr. Albert M. Snell, Rochester, Minn., was the guest speaker, March 18, on "Changing Concepts of Portal Cirrhosis."—Dr. Roy W. Scott, Cleveland, addressed the Summit County Medical Society, Akron, March 4, on "Management of the Failing Heart."—Dr. Hugo Roessler, Philadelphia, addressed the Montgomery County Medical Society, Dayton, March 7, on "Practical Aspects of Cardiology, Such as Dizziness, Fainting, Venous Pulse and Treatment of Emergencies."—Dr. Earl D. Bond, Philadelphia, addressed the Cincinnati Society of Neurology and Psychiatry, March 3, on "Treatment of the Psychoneuroses at the Institute of the Pennsylvania Hospital."—Dr. Berton M. Hogle, Troy, addressed the Miami County Medical Society in Piqua, March 7, on "Gas Bacillus Infection."

OREGON

Hospital News.—Ground has been broken for a six story addition to the Sacred Heart General Hospital, Eugene, to cost \$150,000. It will bring the capacity of the hospital to two hundred beds.—Dr. Philip J. Bartle, Eugene, was elected president of the Oregon Association of Hospitals at the annual meeting in Portland in February.—Dr. Wilson D. McNary has announced his resignation as superintendent of the Eastern Oregon State Hospital, Pendleton, a position he has held for twenty-nine years, according to *Northwest Medicine*.

The Jones Lectures.—Bradley M. Patten, Ph.D., professor and chairman of the department of anatomy and member of the executive committee, University of Michigan Medical School, Ann Arbor, delivered the annual Noble Wiley Jones Lectures at the University of Oregon Medical School, Portland, April 3-4. His subjects were "The First Heart Beats in Living Embryos as Recorded by Micromoving Pictures and

Analyzed Electrocardiographically" and "The Foramen Ovale—Its Development, Its Role in Postnatal Circulatory Changes and Its Congenital Defects."

PENNSYLVANIA

District Meeting.—The Tenth Councilor District, Medical Society of the State of Pennsylvania, held a meeting in Beaver Falls on April 17 with the following speakers, all of Philadelphia: Drs. Robert Bruce Nye on "Relation Between Disease of the Biliary Tract and Affections of the Heart"; George P. Müller, "Surgical Indications in Biliary Tract Disease"; John T. Eads, "Medical Management of Chronic Gallbladder Disease," and Leandro M. Tocantins, "Jaundice from Biliary Tract Disease."

Philadelphia

Study of Malnutrition.—Effects of malnutrition on four thousand school children will be studied in a project recently begun by the Children's Hospital, the Philadelphia Child Health Society and the Ellen H. Richards Institute of Pennsylvania State College. Children of the fifth and sixth grades will be the subjects of the study, which will continue several years, it was said. Pauline Beery Mack, Ph.D., State College, director of the Ellen H. Richards Institute, will direct the study.

Society News.—Dr. Alan R. Moritz, Boston, addressed the Pathological Society of Philadelphia, March 13, on "Forensic Pathology."—Dr. Arthur W. Erskine, Cedar Rapids, Iowa, and Howard B. Alvord, Sc.D., National Institute of Health, Bethesda, Md., addressed the Philadelphia County Medical Society, April 9, on "Practical Methods of Reducing the Cancer Death Rate" and "Recent Investigations Covering the Origin of Mammary Gland Cancer in Mice" respectively.—Dr. George L. Streeter, Baltimore, gave a Nathan Lewis Hatfield Lecture before the College of Physicians of Philadelphia, April 2, on "New Data on Embryogenesis in Monkey and Man."—Drs. John Paul North and Benjamin Lipshutz addressed the Philadelphia Academy of Surgery, April 7, on "Chronic Tenosynovitis" and "Imperforate Anus Associated with Rectovesical Fistula" respectively.

TEXAS

Roentgen Examinations for Beet Workers.—Dr. Thaddeus M. Koppa of the Michigan Department of Health, Lansing, is in San Antonio conducting roentgen examinations among sugar beet laborers of Mexican birth who will work this summer in Michigan fields. The examinations are made because there is a high percentage of tuberculosis among these Texas laborers, according to the Michigan department of health. In 1939 and 1940 ten thousand persons were examined, and tuberculosis was found in two hundred workers. Employment cards were refused them. As in the last two years, the examinations, which will take six weeks, will be made in cooperation with the Michigan Beet Growers Association.

WEST VIRGINIA

Personal.—Dr. Norman G. Patterson, superintendent of McKendree Emergency Hospital, McKendree, has resigned to engage in private practice.—Dr. Owen A. Groves, Hamlin, has been appointed health officer of Kanawha County with headquarters in Charleston, succeeding Dr. Max F. Raine. Dr. Groves has been health officer of the district including Lincoln, Putnam and Wayne counties.

New State Health Officer.—Dr. Clifton F. McClintic, Williamsburg, has been appointed health commissioner of West Virginia, succeeding Dr. Arthur E. McClue. Dr. McClintic, a native of West Virginia, graduated from the University of Cincinnati College of Medicine in 1919. In addition to teaching positions in various medical schools, he has served in the state legislature and has been warden at the state penitentiary.

Society News.—Speakers at a meeting of the Greenbrier Interstate Medical Society in White Sulphur Springs, April 3, were Drs. Henry B. Mulholland, Charlottesville, Va., on "Modern Concepts in the Treatment of Diabetes Mellitus"; Dean B. Cole, Richmond, Va., "Pneumonia," and J. Morrison Hutcheson, Richmond, "Acute Spontaneous Pneumothorax Simulating Coronary Thrombosis."—Dr. Jack Basman, Charleston, addressed the Cabell County Medical Society, Huntington, March 13, on problems in chemotherapy.—Dr. Edward D. King, Cincinnati, addressed the Harrison County Medical Society, Clarksburg, March 6, on "Plastic Surgery of the Nose and Face."—Dr. Carl H. Lenhart, Cleveland, addressed the Kanawha Medical Society, Charleston, March 11, on disease of the gallbladder.

HAWAII

University News.—Dr. Theodore L. Althausen, associate professor of medicine, University of California Medical School, San Francisco, will give a summer course at the University of Hawaii, Honolulu, on "Fundamentals of Health and Disease."

New Medical Headquarters in Honolulu.—Medical and nursing activities in Hawaii have a new central headquarters in the Mabel Smyth Memorial Building, recently completed and dedicated in Honolulu. Offices of the Hawaii Territorial Medical Association, the Honolulu County Medical Society, the Nurses' Association of Hawaii, the Nurses' Association of the City and County of Honolulu, the board of nursing registration, the physicians' exchange, an auditorium with 346 seats and a library are in the new building. Physicians, nurses, business firms and others contributed funds to build the \$100,000 center, which is a memorial to a woman prominent for many years in nursing and public health in Hawaii. The library is the gift of the late Mrs. Charles R. Adams, whose husband was a physician.

PUERTO RICO

Teaching Tropical Medicine.—The director of the School of Tropical Medicine of the University of Puerto Rico, under the auspices of Columbia University, George W. Bachman, Ph.D., has reported activities of the school's fourteenth year. An important event was the establishment of a department of public health, funds for which will be provided by an appropriation under the Social Security Act. Dr. Albert V. Hardy, associate professor of epidemiology at the DeLamar Institute of Public Health, Columbia University, was assigned as the first executive officer of the new department to initiate its program. After three years of reconstruction, the new University Hospital was opened early in the year. The outpatient department was the most important activity of the year under review, 20,077 persons having called for treatment. A new library building, financed by the Puerto Rico Reconstruction Administration, has been completed and a recent grant of \$13,500 from the Carnegie Corporation of New York will provide for equipment. New quarters are under construction for a department of physiology, which is to be developed under the direction of Magnus I. Gregersen, Ph.D., head of the department of physiology at Columbia University College of Physicians and Surgeons, New York.—Dr. Harry S. Mustard, director of the DeLamar Institute, spent several weeks at the School of Tropical Medicine in January in connection with the new school of public health.

GENERAL

Fraudulent Salesman.—A physician from Roselle, Ill., writes that he gave a check of \$7.80 covering subscriptions to several magazines and a Webster's Dictionary to a salesman representing the Readers' Service Bureau, 1428 Times Building, Chicago. On inquiry by the physician, when the order was not delivered, the Readers' Service Bureau reported that the salesman who signed the contract was a fraud. The bureau reported that this was the third similar complaint that had been received and urged cooperation in apprehending the fraudulent salesman. The name on the contract appears to be Elmer J. Peace.

Fellowships in Zoological Research.—The Zoological Society of San Diego announces the renewal of two research fellowships available to advanced graduate students for the pursuit of research work at the Biological Research Institute on some phase of animal biology (concerned primarily with such branches as pathology, bacteriology, parasitology, physiology, comparative anatomy, comparative biochemistry, animal nutrition or animal psychology). The stipend of each fellowship is \$1,000 a year. Further information may be obtained from Charles R. Schroeder, D.V.M., Biological Research Institute, Balboa Park, San Diego, Calif., before May 15.

Society News.—Dr. Philip K. Gilman, San Francisco, was recently chosen president of the Pacific Coast Surgical Association; other officers include Drs. William J. Norris, Los Angeles, and Robert D. Forbes, Seattle, vice presidents, and Frederick L. Reichert, San Francisco, secretary.—Dr. Charles H. Lutterloh, Hot Springs National Park, Ark., was chosen president-elect of the Mid-South Post Graduate Medical Assembly at the annual meeting in Memphis in February, and Dr. Clyde M. Speck, Whitfield, Miss., became president. Vice presidents elected were Drs. Frederick H. Jones, Piggott, Ark.; Jay J. Kazar, Tchula, Miss., and John Jackson, Dyer, Tenn.

Dr. Arthur F. Cooper, Memphis, was reelected secretary.—Dr. Edward W. Alton Ochser, New Orleans, was chosen president-elect of the Southeastern Surgical Congress at the annual session in Richmond, Va., March 10-12. Dr. Julian L. Rawls, Norfolk, Va., became president; Dr. Frank S. Johns, Richmond, was elected vice president and Dr. Benjamin T. Beasley, Atlanta, reelected secretary.

Academy of Physical Medicine.—The nineteenth annual meeting of the American Academy of Physical Medicine will be held at the Hotel Pennsylvania, New York, April 28-30. The speakers will include:

- Harold J. Holmquest, B.S., and Eugene Mittleman, Ph.D., Chicago, Measurements of Useful Output of Diathermy Apparatus by Electrolytic Phantom.
Drs. James Malcolm Bazemore and William Benham Snow, New York, Résumé of Five Years of Fever Therapy.
Dr. Ben L. Boynton, Norfolk, Va., Deep Heat in the Treatment of Hypertension.
Dr. Charles M. Griffith, Washington, D. C., Disabilities Encountered Among Veterans.
Henry Laurens, Ph.D., New Orleans, Influence of the Adrenal Cortex and of Doses of Desoxycorticosterone Acetate on the Blood Pressure Lowering Effect of Carbon Arc Radiation.

One session will be devoted to panel discussions, one on "Physical Medicine in Dermatology" and "Physical Medicine in Relation to the Cancer Problem." During the past year the Academy of Physical Medicine changed its name to the American Academy of Physical Medicine.

Institute of Industrial Medicine and Hygiene.—The American Association of Industrial Physicians and Surgeons and the American Industrial Hygiene Association will present an "Institute of Industrial Medicine and Industrial Hygiene" as the principal feature of their annual meetings in Pittsburgh, May 5-9, at the Hotel William Penn, under the presidency of Dr. Daniel L. Lynch, Boston. Two general sessions will be held with the following speakers, among others:

- Dr. Adolph G. Kammer, East Chicago, Ind., Some Practical Results of Periodic Physical Examinations.
Dr. Alexander H. Colwell, Pittsburgh, Relation of Trauma to Disease.
Dr. William H. Guy, Pittsburgh, Contact Dermatoses.
Frederick B. Flinn, Ph.D., New York, Controlled Radium Hazards.

At a banquet, May 7, the speakers will be Dr. Irvin Abell, Louisville, Ky., chairman of the health and medicine committee of the Federal Security Agency, on "The Role of Industrial Medicine and Industrial Hygiene in National Defense," and Vern O. Knudsen, Ph.D., Los Angeles, "Noise and Hearing."

American Surgical Association.—The annual convention of the American Surgical Association will be held at the Greenbrier Hotel, White Sulphur Springs, W. Va., April 28-30, under the presidency of Dr. David Cheever, Boston. Among the many speakers, the following will be heard in a symposium on surgical preparedness Tuesday:

- Dr. Robert H. Ivy, Philadelphia, Emergency Treatment of War Injuries of the Face and Jaws.
Dr. Norman T. Kirk, colonel, medical corps, U. S. Army, Organization for Evacuation and Treatment of War Casualties.
Dr. Henry H. M. Lyle, New York, The Cooperation Between the Army Services of Evacuation and Hospitalization.
Dr. Frederick R. Hook, commander, medical corps, U. S. Navy, The Role of the Medical Department in Naval Warfare.
Dr. Lennox R. Broster, London, England, title to be announced.
Dr. William E. Gallie, Toronto, Ont., The Experience of the Canadian Army with Amputations of the Lower Extremity.
Drs. Fraser B. Gurd and Laurie H. McKim, Montreal, Que., Bismuth Iodoform Paraffin Paste and Liquid Paraffin Treatment of War and Civilian Wounds.
Dr. Robert H. Kennedy, New York, Present Day Treatment of Compound Fractures.
Dr. Philip D. Wilson, New York, Treatment of Compound Fractures Resulting from Enemy Action.
Dr. Guy A. Caldwell, New Orleans, Effects of Roentgen Therapy upon Gas Gangrene: Clinical and Experimental Observations.
Drs. Charles H. Best and Donald Y. Solandt, Toronto, Ont., Treatment of Shock from the Physiological Point of View.
Drs. Earle B. Mahoney and John J. Morton Jr., Rochester, N. Y., Clinical Value of Preserved Blood Plasma.
Drs. Walter Estell Lee, Jonathan E. Rhoads and William A. Wolff, Ph.D., Philadelphia, Role of Adrenal Cortical Hormone in the Treatment of Patients with Severe Burns.

"Stop the Noise."—Noise Abatement Week will be observed throughout the nation, June 1-7, in accordance with plans approved at a meeting of the National Noise Abatement Council in Cleveland, March 18. The theme of the campaign will be "Stop the Noise." Plans were announced covering educational features of the program, including the distribution of publicity material, with emphasis on pictorial display. It was pointed out that two thousand salesmen, representatives of interested groups, have been instructed to include mention of Noise Abatement Week in their talks in their respective fields, and mayors will be asked to issue proclamations for local

observances. Stress will be placed on engineers' reports of surveys on noise control. The National Noise Abatement Council is the outgrowth of a meeting in Buffalo in 1940, when a group of interested manufacturers met to discuss the prevention of noise. A tentative setup has been directing efforts toward a permanent organization, which was accomplished at the recent Cleveland meeting. By-laws were adopted, and officers chosen include George P. Little of the Celotex Corporation, Chicago, president; S. L. Hooper of Remington Rand, Inc., Buffalo, vice president; G. L. Bostwick, U. S. Gypsum Co., Chicago, treasurer, and F. Edgar McGee of Remington Rand, Inc., Buffalo, secretary pro tem. Offices of the National Noise Abatement Council are located at 19 Rector Street, New York.

Tuberculosis Meetings in San Antonio.—The thirty-seventh annual meeting of the National Tuberculosis Association, the thirty-sixth annual meeting of the American Trudeau Society and the seventeenth annual meeting of the National Conference of Tuberculosis Secretaries will be held on May 5-8 at the Gunter Hotel in San Antonio, Texas. A joint session of the tuberculosis association and the Trudeau society will be devoted to discussions of "National Defense and Health" by Dr. Knox E. Miller, U. S. Public Health Service; Comdr. Robert E. Duncan, M. C., U. S. Navy, Washington, D. C., and Lieut. Col. William C. Pollock, M. C., U. S. Army, Denver. Among speakers before the Trudeau society, which is the medical section of the association, will be:

- Dr. Donato G. Alarcon, Mexico, D. F., Tuberculosis Control Program in Mexico.
Dr. Leopold Brahdy, New York, Tuberculosis as an Occupational Disease Among Hospital Personnel.
Drs. O. Jecovius Farness and Charles W. Mills, Tucson, Ariz., Coccidioidal Infection of the Lung.
Drs. Michael L. Furcolow and Carroll E. Palmer, U. S. Public Health Service; Barbara A. Hewell, Cincinnati, and Waldo E. Nelson, Philadelphia, Quantitative Studies of the Tuberculin Test.
Dr. William O. Fowler, Orlando, Fla., Therapeutic Pneumoperitoneum in Treatment of Pulmonary Tuberculosis and Its Role in the Scheme of Collapse Therapy.

The medical section will join the Bexar County Medical Society, Tuesday evening, in a meeting for general practitioners with these speakers: Drs. James J. Waring, Denver, on "Differential Diagnosis in Pulmonary Tuberculosis"; Paul P. McCain, Sanatorium, N. C., "Management of Pulmonary Tuberculosis," and Chevalier L. Jackson, Philadelphia, "Value of Bronchoscopy in Diseases of the Chest."

U. S. Investigation of Chemical Industries.—The U. S. Department of Justice announced, April 10, that a grand jury sitting in Newark, N. J., has instituted an investigation into alleged restraints of trade and violations of the antitrust laws by certain corporations in the drug, dye and pharmaceutical industries. Subpenas have been issued for the Schering Corporation of Bloomfield, N. J., and the Swiss Bank Corporation of New York, to produce records before the grand jury. Additional subpenas will be issued shortly. This investigation is the result of complaints that certain German interests have entered into agreements with American firms to restrict the production of certain important drug, dye and chemical products and to control and restrict the development by American corporations of foreign trade with South American markets in these commodities. From these complaints it appears that the German interests have entered into patent licensing agreements with American affiliates under which those American firms would withhold their products from South American markets. This, it is complained, was done for the purpose of preserving German control over South American markets for certain drug and dye chemical products. When, as a result of the war, the British blockade made it impossible to ship these products directly from German to South American markets, it is alleged that the German controlling interests arranged to have their American affiliates manufacture the identical German products in this country and to supply them to those South American firms which had placed orders in Germany. The American affiliates, however, were restricted from selling the products generally in South America. Many of the products to which these alleged agreements relate are of great importance from the standpoint of national defense. Complaints received by the department also charge that these agreements have been used to create large German financial credits in the United States and South America. The investigation is being directed by the antitrust division of the department and is in charge of Edward P. Hodges, special assistant to the Attorney General.

Triple Meat Ration for the Diabetic

The Ministry of Food has decided to allow diabetic patients a triple meat ration. Already they get triple rations of butter and margarine. The ministry states that the diabetic, whose lives depend on the use of insulin, run special risks during air raids, which must be guarded against by the patients taking special precautions and by those around them giving prompt and appropriate treatment. They therefore should carry in their pocket or around their neck or wrist information that they have diabetes and are taking insulin. The Diabetic Association supplies a card on which can be written the usual dose of insulin and the name and address of the patient's physician.

Quakers' Work for the Wounded

The religious principles of the Quakers forbid them to take part in war. On the other hand they are distinguished for their practical philanthropy. In this war, as they did in the last, they are doing much for the wounded. A report of the Friends' Ambulance Unit shows that after a period of training in camps and hospitals over five hundred young Quakers engaged in ambulance work oversea. They did work in Finland with twenty ambulances, lorries, staff cars and a kitchen car, transporting wounded from the front line, frequently under machine gun fire and bombing from airplanes. Later they transferred to Norway and some to Egypt. After the evacuation of Dunkirk many worked in emergency hospitals in Britain. In the last war they did similar work, but the iniquity of the enemy in setting Europe aflame was too much for some of them and they transferred to the fighting line.

Harvard to Give Medical Help

With the consent of Dr. James B. Conant, president of Harvard University, Dr. J. E. Gordon, professor of preventive medicine and epidemiology in the university, has accepted the invitation of Mr. Malcolm Macdonald, minister of health, to act as United States liaison officer with the Ministry of Health. Soon after the outbreak of war, Harvard appointed a committee to consider how the university could contribute material or professional help to a cause closely connected with its interests. The possible nature of this help was conceived in the broadest terms, with the suggestion that it might be in the fields of economics, medicine, public health, sociology, law and perhaps other fields. On exchange of opinion between the university and British colleagues, it became evident that help in the fields of medicine and public health was most clearly wanted. In June 1940 Harvard made a formal offer to the minister of health, which was gratefully accepted, to equip and maintain in Britain a public health unit for the study and control of communicable disease. The purposes of the unit were defined as "to lend material aid to a friendly nation, to investigate communicable disease under unusual military and civil conditions and to obtain medical information of value to the national defense of America."

The unit was to include a group of workers concerned with field studies in epidemiology and a laboratory for the study of associated problems. British authorities pointed out the desirability of adding a well equipped hospital for the clinical care and study of communicable disease. This was made possible by the cooperation of the American Red Cross, which agreed to build and transport to Britain a prefabricated hospital of one hundred and twenty-five beds. The final plans for the unit were evolved from discussions between Professor Gordon

and the Ministry of Health in London. Facilities and staff have been provided for the study of communicable disease in the laboratory and at the bedside.

In September Professor Gordon returned to America to lay plans for the hospital. He left in London Dr. John R. Mote, assistant in epidemiology in the Department of Preventive Medicine of Harvard University, who is now acting as medical adviser to the American Red Cross committee in London, to complete local arrangements. Professor Gordon has now returned to London, and the first shipments from America are expected to arrive soon. As liaison officer with the Ministry of Health, Professor Gordon has an office in the ministry.

Sir Pendrill Varrier-Jones

Sir Pendrill Varrier-Jones, the pioneer of village settlements for tuberculosis, has died at the age of 68 years. In 1914 while a research student he was invited to act as a tuberculosis officer for a few weeks, which became months, and he began to see the uselessness of even the most excellent advice to those whose economic position prevented them from taking it. Tuberculosis might be arrested by sanatorium treatment, but when a man returned to his occupation and was exposed to the strain of competition with healthy labor he broke down, lost hope and became a charge on the state. Varrier-Jones saw that tuberculosis was more than a medical problem—it was an economic one. With the aid of prominent Cambridge men—the late Sir Clifford Allbutt, the late Sir German Sims-Woodhead and Sir Humphry Rolleston—he attacked the economic problem by a new method. First one patient was provided with work in special conditions conducive to recovery; then others were added, and from this grew the village settlement for tuberculosis at Papworth, a great institution with 500 acres of land, hospital blocks with every facility for modern treatment, a large sanatorium section, laboratories and a research institute, a village settlement of one hundred cottages, hostels, and factories equipped with labor-saving machinery. Here men worked at their various trades under ideal conditions. The yearly sales of the products of the settlement amount to \$450,000. The scheme proved such a success that it has been followed in other countries. A man of boundless enthusiasm, Pendrill-Jones was ever devising new schemes and at the time of his death was engaged in one for teaching. He was to have represented the British government in 1939 at the meeting in Berlin of the International Union against Tuberculosis, which was prevented by the war.

AUSTRALIA

(From Our Regular Correspondent)

Dec. 27, 1940.

New Light on Poliomyelitis

From experiments carried out at the Walter and Eliza Hall Institute, Melbourne, following the 1937-1938 epidemic of poliomyelitis in Victoria F. M. Burnet has drawn the conclusion that the virus of poliomyelitis has undergone a change. No abnormality was found in the olfactory bulbs of 10 out of 11 patients who died in the acute phase of the disease. This observation, combined with the frequency with which the virus was found in tonsils, nasopharyngeal washings and feces, points rather to other channels of invasion than the generally accepted path by way of the olfactory bulbs. Further, Burnet has demonstrated a remarkable lack of influence of the Victorian infection on the production of antibody.

Changes have also been observed in the age distribution of the disease. Up to 1920 the epidemic age distribution was different from that of other acute infectious diseases. It was a disease of very young children, correctly described as infantile paralysis. In several epidemics since 1920 the age incidence has altered and now closely resembles that of the other common infectious illnesses of childhood. Further differences between the old type

of disease and that of the Victorian epidemic were noticed in the clinical nature and mode of spread of the disease. Few victims escaped paralysis, and there was little evidence to suggest that symptomless adults disseminated the infection.

Burnet concludes, therefore, that before 1920 the virus was one of low virulence but high infectivity, causing widespread and recurrent infection of both adults and children, invading the pharyngeal mucosa and only rarely revealing itself by paralysis. On the other hand, he suggests that the virus is now accommodating itself to changes in the environment and personal habits of civilized communities by becoming more definitely neurotropic and at the same time less infective and less antigenic. The widespread adult reservoir of adult infection is disappearing; thus there is less exposure of very young children, and those of early school ages at which random contacts increase are most affected.

Influenza Virus Infections of the Chick Embryo Lung

F. M. Burnet, working at the Walter and Eliza Hall Institute, Melbourne, has made another valuable discovery regarding the use of chick embryo in the experimental study of the viruses. In the *British Journal of Experimental Pathology* (21:147 [June] 1940) he reports that influenza virus strains can be propagated in chick embryos without preliminary adaptation when the inoculation is made through the amniotic cavity.

The virus produces specific infections of the embryo lung which may be recognized by the gross and microscopic appearances of the lungs, or with greater rapidity and certainty by examination of stained smears of tracheal fluid.

The technic of this method is described. Burnet claims that amniotic inoculation is in a certain sense equivalent to placing the embryo in an infected external environment from which infection can be derived by more or less "natural" routes. It is possible that this circumstance could be applied to the study of viruses other than pneumotropic ones.

This work is of possible importance for two reasons: First, Burnet has successfully infected chick embryo with material of human origin which has passed through only one ferret. He is optimistic that viruses obtained directly from human beings would infect equally well, though he has not had an opportunity to test the point. Such a rapid and reliable means of recognizing influenza virus infection in man without recourse to the somewhat inconvenient ferret would be of great practical value.

Second, the new method offers a possible means for the isolation of some of those viruses, other than that of epidemic influenza, which produce respiratory disorders in man but which so far have eluded study because there is no susceptible test animal.

Another potentiality is the production of antigenic material from virus as little removed from the original human type as possible. In the event of a pandemic due to an antigenically new type of influenza virus, it might be of greatest value to be in a position to produce large quantities of virus in the universally available chick embryo as soon as the responsible virus is isolated.

Heart Disease in Queensland

Vital statistics for the state of Queensland for 1939 show that, of a total of 9,530 deaths, 2,786 were classified as from disease of the heart or circulatory system. Cancer and other tumors were responsible for 1,069, and diseases of the respiratory system for 811. Parasitic and infectious diseases claimed a total of 747, the chief of these being tuberculosis of the lungs (290) and influenza (221). These last would seem unnecessarily high in view of Queensland's dry and sunny climate and the availability of fresh, natural foods. Violent or accidental deaths claimed 812 victims.

Out of a mean population of 1,013,000, over 95,000 persons received treatment at public hospitals during the year. During recent years the Queensland government, with the aid of a state lottery, has established hospitals throughout the state.

The more cynical of the profession in Queensland have called them "monuments to our morbidity," and last year's high sickness and invalidity rate does indeed make one wonder whether it would not have been better to devote less to the institution of hospitals and more to constructive efforts to utilize Queensland's natural health advantages.

Medical Practice in New Zealand

This year New Zealand celebrates the hundredth anniversary of its becoming a colony of the British Empire. In spite of its comparative youth, the Dominion has acquired a system of medical practice in many respects unique, developed to meet the demand of a comparatively small scattered population of just over one million people more or less remote from other medical centers.

Medical training is available through the University of New Zealand, an examining body with six constituent colleges; a medical student may do his first year's work at any one of the four chief colleges, situated in Auckland, Dunedin, Christchurch and Wellington respectively. From his second to his fifth year he attends the Otago National Medical School in Dunedin, and for his sixth (clinical) year he may choose the public hospital in any one of the four cities mentioned. The number of students in each year has fluctuated between thirty and a hundred in the past twenty years.

Well-to-do parents are perhaps not so much a prerequisite for medical training in New Zealand as in Europe; many students can live at home, and plenty of government scholarships are available. In the early years of training students can augment their resources by working in the country during the long vacation.

Comparatively little has been attempted in the way of original research or investigation in New Zealand, and there are few appointments for full time research work. Nor has postgraduate education been attempted. Up until twenty years ago most students went to England to qualify, and there is still a strong tendency for them to go abroad after a year or two as hospital residents and before settling into practice. They usually spend from one to five years in England or America, taking resident posts and working for a higher degree. Many, of course, never return to New Zealand but find opportunities elsewhere for special work.

Those who do return usually are obliged to enter general practice, there being only a limited number of specialist appointments available. The duties falling to a general practitioner in New Zealand include lodge practice (which is equivalent to panel practice) anesthetics and obstetrics. Also he may hold an appointment as senior surgeon at a public hospital and teach clinical surgery to the final year students.

The public hospitals in New Zealand were founded as government institutions, in the first place to care for the Maoris, but later the poorer members of the white community made use of them. It was hoped that they would be supported by voluntary contributions and rates, but these sources proved insufficient and the government has had to assume greater responsibility for them. In 1939, under the national insurance scheme, hospital benefits were made available to all: out of a fund raised from taxation and compulsory contributions the government pays the hospital 6s a day for every patient. Every citizen has a right to avail himself of the services of a public hospital, including those of the consultant staff, but private hospitals exist for those who wish to use them. Many of the well-to-do group, however, now make use of the public hospitals, and the payment offered to hospital consultants will offset the financial disadvantages they have hitherto suffered on this account.

Being a new country and a small one, removed from the immediate action of the war, New Zealand may provide fertile material for experiment in the search for a better system of administering medical care.

Deaths

Charles Joseph Whalen * Chicago; Rush Medical College, Chicago, 1891; member of the House of Delegates of the American Medical Association from 1915 to 1918 and from 1920 to 1940; professor of medicine, 1913-1914, member of the board of trustees, 1914-1915, member of the council and professor of medicine, 1915-1916, Bennett Medical College; formerly associate professor of medicine at his alma mater; past president of the Chicago Medical Society and the Illinois State Medical Society; at one time health commissioner of Chicago; editor of the *Illinois State Medical Journal*; aged 72; formerly on the consulting staff of the Cook County Hospital and on the staff of St. Joseph's Hospital; on the staff of the Ravenswood Hospital, where he died, April 7, of lymphatic leukemia.

Fred Moore * Des Moines, Iowa; member of the Council on Medical Education and Hospitals of the American Medical Association from 1934 to 1941 and member of its House of Delegates in 1927 and from 1931 to 1940; died, April 8, of carcinoma of the stomach. Dr. Moore was born in Harlan, Iowa, May 10, 1883, and graduated from the State University of Iowa College of Medicine, Iowa City, in 1911. He was a member of the American Academy of Pediatrics and past president of the Polk County Medical Society. Dr. Moore was director of the health department of the public schools of Des Moines and was on the staffs of the Iowa Methodist, Iowa Lutheran and Mercy hospitals.

Edward Clark, Buffalo; University of Buffalo School of Medicine, 1880; past president of the Erie County Medical Society; formerly demonstrator of anatomy at his alma mater; became a member of the city board of health in 1884; four years later was appointed city health commissioner; when the public health council was created in 1913, was appointed a member; was district state health officer of the territory comprising Erie, Genesee, Niagara and Orleans counties; for many years assistant surgeon at the Charity Hospital; aged 87; died, February 28, of chronic myocarditis and arteriosclerosis.

Roy Alpha Payne * Portland, Ore.; University of Minnesota Medical School, Minneapolis, 1915; past president of the Multnomah County Medical Society and the Pacific Coast Roentgen Ray Society; member of the American Roentgen Ray Society, Radiological Society of North America, the American College of Radiology and the North Pacific Society of Internal Medicine; clinical associate in internal medicine at the University of Oregon Medical School; member of the state board of health; aged 55; died, February 12, of melanocarcinoma of the toe with metastases to the liver and brain.

George Harold Belote * Ann Arbor, Mich.; University of Michigan Medical School, Ann Arbor, 1923; instructor in dermatology and syphilology and research assistant from 1925 to 1927, assistant professor from 1928 to 1930 and since 1930 associate professor of dermatology and syphilology at his alma mater; member of the American Dermatological Association and the American Academy of Dermatology and Syphilology; served during the World War; on the staff of the University Hospital; aged 46; died, March 11, of carcinoma of the liver.

Hazle Padgett, Nashville, Tenn.; University of Pennsylvania Department of Medicine, Philadelphia, 1892; professor of physiology and general histology at the University of Tennessee College of Medicine, Memphis, from 1893 to 1900, professor of physical diagnosis from 1900 to 1909 and professor of clinical medicine and nervous and mental diseases from 1909 to 1911; at one time on the staff of the Nashville General Hospital; aged 73; died, February 11, of myocarditis.

William D. Beadie, Windom, Minn.; McGill University Faculty of Medicine, Montreal, Que., 1900; member of the Minnesota State Medical Association; for many years superintendent of the Mineral Springs Sanatorium, Cannon Falls; formerly medical director of the Pokegama Sanatorium, Pokegama, Minn.; aged 66; died, February 7, of cerebral hemorrhage, hypertension and arteriosclerosis.

Frank William Sorell, San Antonio, Texas; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; served during the World War; on the staffs of the Robert B. Green Memorial Hospital and the Physicians and Surgeons Hospital; aged 59; died, January 25, in the Nix Hospital of influenza and coronary thrombosis.

William Amos Rohlf, Waverly, Iowa; State University of Iowa College of Medicine, Iowa City, 1891; member and past president of the Iowa State Medical Society; past presi-

dent of the Bremer County Medical Society; fellow of the American College of Surgeons; formerly president of the staff of St. Joseph Mercy Hospital; aged 74; died, February 17.

Arthur Henry Johnson, Portland, Ore.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1895; member of the Oregon State Medical Society; fellow of the American College of Surgeons; on the staffs of the Emanuel and Good Samaritan hospitals and Portland Sanitarium; aged 71; died, February 17, of coronary occlusion.

Wendell Arthur Heath Paige * Brownwood, Texas; George Washington University School of Medicine, Washington, D. C., 1911; fellow of the American College of Physicians; served during the World War; for many years on the staff of the Medical Arts Hospital; aged 54; was found dead, February 14, of a self-inflicted bullet wound.

William Edwin Cass, Vancouver, Wash.; Toledo (Ohio) Medical College, 1898; Washington University School of Medicine, St. Louis, 1899; member of the Washington State Medical Association; at one time a captain in the United States Army; aged 79; died, February 1, in the Veterans Administration Facility, Portland, Ore.

Carl Aschenbrenner * Pella, Iowa; State University of Iowa College of Homeopathic Medicine, Iowa City, 1894; past president of the Marion County Medical Society; formerly state senator; served during the World War; health officer of Pella; aged 75; died, February 26, of a malignant growth of the lungs.

Amelia Louise Klehm, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; aged 70; since 1925 on the staff of St. Francis Hospital, Evanston, where she died, February 22, of melanocarcinoma of the eye with metastasis to the liver.

Isadore Katz, Philadelphia; Temple University School of Medicine, Philadelphia, 1929; member of the Medical Society of the State of Pennsylvania; assistant in anatomy at his alma mater; on the staff of the Mount Sinai Hospital; aged 35; died, February 20, of coronary thrombosis.

Albert Edwin Hager, Taylor, Pa.; Jefferson Medical College of Philadelphia, 1895; member of the Medical Society of the State of Pennsylvania; formerly health officer; at one time on the staff of the Taylor Hospital; aged 71; died, February 15, of coronary thrombosis.

Louis Lincoln Gregory, Urbana, Ill.; Chicago Medical College, 1888; member of the Illinois State Medical Society; formerly on the staffs of the Cook County Hospital, Henrotin Hospital and the Ravenswood Hospital, Chicago; aged 81; died, February 3, of coronary thrombosis.

Hugh Alexis Rasmussen, Beardstown, Ill.; University of Illinois College of Medicine, Chicago, 1930; formerly a member of the U. S. Indian Service; aged 35; died, February 23, at Maywood of burns and suffocation when a cigaret ignited the chair in which he had fallen asleep.

John Paul McHugh * Long Island City, N. Y.; University and Bellevue Hospital Medical College, New York, 1916; fellow of the American College of Surgeons; aged 49; attending surgeon, St. John's Hospital, where he died, February 3, of hypertension and heart disease.

Mabel Eloise Curtiss, Smyrna, Del.; Woman's Medical College of Pennsylvania, Philadelphia, 1921; since Dec. 29, 1937 assistant physician on the staff of the Delaware State Welfare Home; aged 44; died, February 21, in Bristol, Conn., of tuberculosis of the spine.

Theodore Yuhl, New York; Magyar Királyi Pázmány Petrus Tudományegyetem Orvosi Fakultasa, Budapest, Hungary, 1917; aged 47; died, January 29, in the New York Post-Graduate Medical School and Hospital of chronic cholecystitis and pancreatitis.

Charles Edwin Benham, Tarkio, Mo.; University Medical College of Kansas City, Mo., 1900; member of the Missouri State Medical Association; aged 75; died, February 20, in a hospital at Maryville of injuries received in an automobile accident.

Frederick Walker Houghton * Council Bluffs, Iowa; College of Physicians and Surgeons, medical department of Columbia College, New York, 1883; aged 79; died, February 12, in the Nicholas Senn Hospital, Omaha, of congestive heart disease.

William Blamyier Deas, Augusta, Ga.; Cooper Medical College, San Francisco, 1889; served during the World War; aged 72; died, January 19, of lobar pneumonia, fracture of the neck of the femur, cerebral hemorrhage and arteriosclerosis.

George Ralph Andrews, Detroit; Hahnemann Medical College and Hospital, Chicago, 1884; bank president; member of the board of trustees of the Children's Hospital of Michigan; aged 77; died, February 21, of septic cholecystitis and peritonitis.

Joseph Alphonse Roy, Red Lake Falls, Minn.; School of Medicine and Surgery of Montreal, Que., Canada, 1913; member of the Minnesota State Medical Association; formerly mayor; aged 52; died, January 30, of coronary thrombosis.

Samuel Tilden Marshall, Dover, Ohio; Starling Medical College, Columbus, 1903; member of the Ohio State Medical Association; aged 64; on the staff of the Union Hospital, where he died, January 28, of coronary occlusion.

Walter E. Stathers, Buckhannon, W. Va.; College of Physicians and Surgeons, Baltimore, 1881; Civil War veteran; superintendent of the Weston (W. Va.) State Hospital from 1897 to 1901; aged 92; died, January 19.

Edward Joseph Magee, Danvers, Mass.; College of Physicians and Surgeons, Boston, 1891; member of the Massachusetts Medical Society; on the staff of the Hunt Memorial Hospital; aged 77; died, January 20.

Robert Palmer Fulton, Lakewood, Ohio; Western Reserve University School of Medicine, Cleveland, 1935; member of the Ohio State Medical Association; aged 30; died, January 30, in the Lakeside Hospital, Cleveland.

Omie Joe Letherman @ Thornville, Ohio; Ohio Medical University, Columbus, 1903; served during the World War; aged 58; died, February 12, in the Mount Carmel Hospital, Columbus, of coronary occlusion.

Jonathan Finley Mathews, Houston, Texas; Starling Medical College, Columbus, 1898; member of the State Medical Association of Texas; aged 73; died, January 19, of coronary occlusion and arteriosclerosis.

Walter H. Lott, Monroe, Ga.; Atlanta College of Physicians and Surgeons, 1906; member of the Medical Association of Georgia; aged 60; died, January 9, in the South Carolina Baptist Hospital, Columbia.

Edgar Allen Fleetwood, Clarksburg, W. Va.; University of Maryland School of Medicine, Baltimore, 1904; aged 59; died, February 13, in St. Mary's Hospital of injuries received in an automobile accident.

Bertha Lawton Clinton @ Paris, Ill.; Northwestern University Woman's Medical School, Chicago, 1899; aged 68; on the staff of the Paris Hospital, where she died, February 11, of coronary occlusion.

Moritz F. Weyman, St. Joseph, Mo.; Central College of Physicians and Surgeons, Indianapolis, 1887; aged 77; died, January 28, in State Hospital number 2 of hypertensive cardiovascular disease.

Wesley Dallas Hicks, San Antonio, Texas; Maryland Medical College, Baltimore, 1902; member of the State Medical Association of Texas; served during the World War; aged 66; died, January 18.

William Nelson Brooks, Goose Creek, Texas; St. Louis College of Physicians and Surgeons, 1895; aged 72; on the staff of the Goose Creek Hospital, where he died, February 7, of pneumonia.

Charles Henry Davis @ South Hamilton, Mass.; Harvard Medical School, Boston, 1899; served during the World War; on the staff of the Beverly (Mass.) Hospital; aged 67; died, January 14.

Charles Joseph Schoenfeld, La Crosse, Wis.; Northwestern University Medical School, Chicago, 1899; served during the World War; aged 63; died, January 3, of myocarditis.

Howard Hamblen @ South Windham, Maine; Tufts College Medical School, Boston, 1900; aged 67; died in February in a hospital in Portland of heart disease and lobar pneumonia.

Ithamar Gordon Bogart, Kingston, Ont., Canada; Queen's University Faculty of Medicine, Kingston, 1901; associate professor of surgery at his alma mater; aged 71; died, January 13.

Henri Desmarais, Coderre, Sask., Canada; School of Medicine and Surgery of Montreal, Faculty of Medicine of the University of Laval at Montreal, 1904; aged 62; died, January 21.

Richard McCormick, Waco, Texas; Vanderbilt University School of Medicine, Nashville, 1892; formerly county health officer; aged 73; died, January 30, in a hospital at Dallas.

Frank Eugene Bard, Grosse Pointe Park, Mich.; Cleveland University of Medicine and Surgery, 1897; aged 75; died, February 14, in Columbus, Ohio, of acute spastic colitis.

Philip Theodore Leyendecker, New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1884; aged 80; died, January 22.

John Jacob Reynolds, Defiance, Ohio; Detroit Medical College, 1879; past president of the Defiance County Medical Society; aged 86; died, January 30, of bronchitis.

James W. Bishop, Lake City, Fla.; Maryland Medical College, Baltimore, 1905; aged 63; died, February 4, of arteriosclerosis, hypertension and chronic nephritis.

Harold Imrie Wallace, Rosemead, Calif.; Detroit College of Medicine, 1898; formerly on the staff of the Harper Hospital, Detroit; aged 66; died, January 21.

William G. Harwood, Dover, Mo.; Missouri Medical College, St. Louis, 1882; member of the Missouri State Medical Association; aged 83; died, January 28.

Stanfield H. Keeney, Indianapolis; Central College of Physicians and Surgeons, Indianapolis, 1900; aged 78; died, January 10, of carcinoma of the prostate.

George Givins Harvey @ Springfield, Ill.; Johns Hopkins University School of Medicine, Baltimore, 1919; aged 46; died, February 16, of coronary occlusion.

Nelson Eugene Oliver, Thornton, Ill.; Rush Medical College, Chicago, 1880; member of the Illinois State Medical Society; aged 83; died, January 8.

Lucia Maria Lane, San Mateo, Calif.; Woman's Medical College of Pennsylvania, Philadelphia, 1888; aged 84; died, January 27, of bronchopneumonia.

William Nathan Lowry, Pine Lawn, Mo.; Kentucky School of Medicine, Louisville, 1882; aged 81; died, January 3, in St. Luke's Hospital, St. Louis.

Hermann Kerk sieck, Viroqua, Wis.; Albert-Ludwigs-Universität Medizinische Fakultät, Freiburg, Baden, Germany, 1889; aged 77; died, January 24.

Jacob A. Maryson, New York; University of the City of New York Medical Department, 1892; aged 74; died, January 18, of coronary thrombosis.

Fisher M. Joslin @ Albany, N. Y.; Albany Medical College, 1893; health officer of Voorheesville; aged 72; died, January 26, of cerebral hemorrhage.

Joseph M. Reeves, Spring Lake, N. J.; Hahnemann Medical College of Philadelphia, 1877; aged 86; died, January 24, of arteriosclerotic heart disease.

Byron Linzie Kesler, Bountiful, Utah; Jefferson Medical College of Philadelphia, 1904; also a dentist; formerly mayor; aged 73; died, January 23.

Frind Robert Frazar @ Merryville, La.; Memphis (Tenn.) Hospital Medical College, 1912; aged 57; died, February 2, in a hospital at New Orleans.

Charles Lee Roland, Humboldt, S. D.; John A. Creighton Medical College, Omaha, 1895; aged 73; died, January 23, of cerebral hemorrhage.

Robert Morton Manson @ Hayward, Calif.; Oakland College of Medicine and Surgery, Oakland, Calif., 1915; aged 62; died, January 8.

Smith Layton Walker, Pictou, N. S., Canada; Bellevue Hospital Medical College, New York, 1890; aged 76; died, January 8.

Robert Oliver, Hamilton, Ont., Canada; McGill University Faculty of Medicine, Montreal, Que., 1916; aged 53; died, January 8.

A. W. Davis, Tusculumbia, Ala.; Meharry Medical College, Nashville, Tenn., 1903; aged 66; died, January 22, of coronary occlusion.

Edgar Langlois, Montreal, Que., Canada; Laval University Medical Faculty, Montreal, 1917; aged 47; died, January 31.

Robert Levy May, Delhi, La.; University of Tennessee Medical Department, Nashville, 1900; aged 66; died in January.

James L. Mason, Lowell, Ohio; Medical College of Ohio, Cincinnati, 1883; aged 86; died, January 3, of bronchopneumonia.

John Wesley Green, Gurdon, Ark. (licensed in Arkansas in 1903); aged 70; died, February 2, of bronchopneumonia.

Paul Andrew Zoells, Los Angeles; Medico-Chirurgical College of Philadelphia, 1902; aged 60; died, January 28.

William Presley Hall, Albertville, Ala.; Southern Medical College, Atlanta, Ga., 1886; aged 82; died, January 26.

Bureau of Investigation

REACH FOR A SWEET AND REDUCE— YOUR APPETITE?

During the past year the Bureau of Investigation has received many inquiries concerning a preparation called "Ayds." Current advertising for this product reads: "Now! Many Lose Weight by New, Easy Plan. Eat Candy Every Day!"

In the past, many preparations for reducing have been promoted which contained ingredients or were accompanied by regimens that were detrimental. The principle involved in this new promotion would seem to be that the eating of a piece of caramel-like candy before a meal will reduce the appetite and therefore the food intake and, finally, the weight of the person who indulges in this procedure. The manufacturers say "You must be careful, however, not to eat Ayds except as directed—as too many would be fattening instead of helping to lose weight" [sic]. The concern thus admits that there is nothing in this preparation which of itself would make one lose weight. As a matter of fact, it offers a \$1,000 guaranty to any one who can prove that there is anything harmful or injurious to the human system in this candy.

Since the promoters know that a restricted diet may result in elimination or reduction of certain food essentials, the manufacturers claim that their preparation contains "powdered carrots, egg yolk, maltose, soy bean flour, coconut oil, milk solids and vitamin A, B₁ and D." This might be satisfactory if the quantities of the dietary essentials such as vitamins in the preparation would serve as an adequate substitute for the particular foods or quantities of foods which were omitted from the diet as a result of taking this candy. Whether or not the claimed vitamin content per caramel—915 units of A, 23 of B₁ and 108 of D—meets this requirement cannot be determined. (On the average a quart of milk contains 1,500 units of A, 195 units of B₁ and 650 units of B₂, which, like C, is not referred to in the list of ingredients.) Presumably when taken according to the directions of the manufacturer Ayds will furnish 2,745 units of A, 69 of B₁ and 324 of D daily. The total adult daily requirements are approximately 4,000-6,000 of A and about 600 of B₁.

One may reasonably question whether or not this product offers anything more significant than an excuse for lessening food intake. Although the appetite at the time of consumption may be lessened it is obvious that an extra meal or midnight snack would offset any such lessening.

This preparation—Ayds—is recommended as a partial substitute for a regular food intake and therefore might be considered as a dietary food. Section 403 (j) of the Food, Drug and Cosmetic Act states that a food should be deemed to be misbranded "if it purports to be or is represented for special dietary uses, unless its label bears such information concerning its vitamin, mineral and other dietary properties as the Secretary¹ determines to be, and by regulations prescribes as, necessary in order fully to inform purchasers as to its value for such uses."

The general decision of the Council on Foods and Nutrition on the subject of Foods for Weight Reduction contains the following paragraph:

"It is important that the contributions to the day's diet made by any so-called 'reducing food' be clearly indicated. If the product is intended to replace one or two meals a day, suitable suggestions for the other meal or meals should be made. The advertising also should carry a statement that dieting to reduce is not without certain dangers, and it should be undertaken only under medical guidance."

The promoters of Ayds say that the plan is not an experiment, that it has been in use for more than two years, and that many persons who were overweight have had an opportunity to give

it a practical test. Nevertheless the use of such a preparation would be considered by the Bureau to be experimental until there is scientific evidence that the preparation and the regimen to be followed in connection with its use constitute an effective and safe procedure for all who might use it.

The disclaimer in the advertising "We do not recommend Ayds to overweights who are suffering from glandular or other constitutional difficulties, or to Diabetics. We advocate that in such cases an overweight seek the advice of a competent physician" is inadequate. How is the user to know that his overweight is due to glandular or other constitutional difficulties? Is the manufacturer suggesting that before any one uses Ayds in self medication, he is supposed to consult his physician, so that it is possible to follow this recommendation? The promotion states, further, that "If you are overweight, in good health and have no glandular trouble, you know, of course, that you eat more than you need. And one of the reasons you eat too much is, perhaps, because you are in such good health and have such a fine appetite." In other words, the promoters intimate that if you are in good health and have a fine appetite you probably overeat, and further, that a reduced food intake will not harm you. But can they guarantee that the new diet will contain an adequate supply of food essentials to maintain your good health?

The following sentences appear in the advertising:

"Exercise such as swimming, walking, running, bicycling, skating or any kind of gymnastics are wonderful if not overdone by those beyond middle age. The only disadvantage to special exercises is that once started, they must be continued if we want to keep the weight down."

The manufacturers then suggest that by using Ayds you get in the habit of eating less food and therefore imply that you do not need to continue using this preparation as you would continue to need exercise. The manufacturers further point out that "Exercises of all kinds, massages and steam baths are all very good in their place, but often they increase the appetite to such an extent that it is mighty hard to lose any weight." It seems pertinent to suggest that the use of Ayds and the amount of lessened food intake, if any, is a regimen that would in many, if not all, cases probably have to be maintained.

Last, but not least, the manufacturers of Ayds use the time-worn testimonial to attest the virtues of their product. Headings used are as follows: "Loses 42 Pounds in Sixty Days," "Loses 45 Pounds—20 Inches At Waist!" "Loses 40 Pounds—Friends Look Twice!" "Loses 17 Pounds, Friends Notice Improvement," and so on. And, finally, some paragraphs under the name of W. F. Briney, M.D., which read as follows:

"To the average fat woman who loves candy, to reduce her weight by a plan that directs eating candy is a novel idea and one which appeals to her very much.

"But this is just what Ayds Plan does to most normally healthy overweight women—reduces without the aid of Cathartics, Glandular products or harmful drugs of any kind.

"The manufacturers of Ayds state that their Candy contains only Vitamins A, B-1 and D, plus food factors from milk, egg-yolk, maltose and plants. Analysis will show: Vitamins A, B-1, D; Dicalcium Phosphate; Powdered Carrots; Artificial Flavors; Powdered Egg Yolks; Whole Milk; Soy Bean Flour; Sugar, Coconut Oil; Salt, Corn Syrup—which substantiates the listing contained in the advertising and directions for use. It was found that the product contained no narcotics, no laxatives, and no glandular extracts such as characterize many other products in the reducing field."

Whether W. F. Briney, M.D., is William F. Briney or Walter F. Briney we do not know, as both of them have as their address that of the Lawndale Laboratories, promoters of glandular products; neither is a member or a Fellow of the American Medical Association. The Bureau has no evidence that either one of them has had any special training in the field of endocrinology, although one of them writes the pamphlets issued by the Lawndale Laboratories on this subject. That either would permit his name to appear under the general heading "Reducing While Eating Candy" and have the remainder of the material under that heading consist of testimonials speaks for itself. The Carlay Company, promoters of Ayds, of course, disclaims these testimonials by stating "These individual unsolicited testimonials are not to be considered as promising equal results to any other individual." If the firm means to imply by this that the testimonials are meaningless, THE JOURNAL is willing to agree.

1. This presumably referred to the Secretary of the Department of Agriculture, but since the Food and Drug Administration has been transferred from that department to the Federal Security Agency, it is presumed that the Administrator of the Federal Security Agency acts in the place of the secretary in this respect.

Correspondence

THE GASTROINTESTINAL EXAMINATION

To the Editor:—At the risk of unduly prolonging the argument on what is meant by a complete gastrointestinal examination: Dr. Gregory Connell in his letter published February 22 raises a perfectly good point—that the gastrointestinal tract is an entity and should be examined as such. My letter published January 18 does not imply the espousal of incomplete examinations. However, the complete gastrointestinal examination takes time and money to do, and my complaint was directed at the physician whose conception of a "g-i" is an examination of the stomach only, who has told the patient it will involve only a short time and who has probably prepared the patient for a fee which would not pay for the cost of the films alone if a proper examination of the complete tract is to be done. Under the setup that governs our practice, all discussion aside as to the merits of the situation, the patient's clinician is responsible for deciding what he wants examined, and my plea is simply that the clinician should have the same conception of what a complete "g-i" is that the man has who is to do it. The fact remains that the roentgenologist is called on to examine what the referring physician calls for; and when a physician calls for "a complete 'g-i'" and then takes umbrage at being asked if a barium enema is desired and says "if I want a barium enema I'll specify it," that physician does not know what a complete "g-i," so called, is, and it makes for misunderstanding between referring physician, roentgenologist and patient—a triad among whom harmony is greatly to be desired.

Only in Utopia will it ever be possible to do complete gastrointestinal examinations on all patients with digestive disturbances; and in Utopia there will be no digestive disturbances in the first place.

RAMSAY SPILLMAN, M.D., New York.

SENSITIZATION TO VINYL RESIN

To the Editor:—For a rather important reason I have recently explored the literature with regard to whether sensitiveness to vinyl resin is known to develop in man. I have found only one report (Occupational Dermatitis from Handling Resin-Lined Tin Cans, *THE JOURNAL*, Aug. 10, 1940, p. 448) in which sensitiveness to vinyl resin has been presumed. Schwartz and Russell observed a dermatitis confined chiefly to the cubital spaces and axillae of persons handling unused tin cans coated with an enamel. Three of the affected workers were given patch tests with a metallic colored dust collected from the traveling belt which conveyed the cans. After twenty-four hours two of the three persons showed a positive reaction. Although the dust was found to contain principally tin, iron and resin, it is not certain that the offending substance was a metal, a resin or other substances that might be present on a conveyor belt or in the storage room for cans of a canning factory, or in the freight cars which carried the cans to the factory. That vinyl resin was the offending substance is most unlikely, since the factory concerned canned fruits and juices, according to the implication of the authors, and vinylite enameled cans are not used for fruit and vegetable products because such an enamel "blushes" when exposed to temperatures necessary for processing fruits and vegetables. Hence this evidence, along with other circumstantial evidence submitted by the authors, is insufficient to incriminate vinyl resin.

The medical records of a large manufacturer of cans indicate that when dermatitis has occurred in their manufacturing plants, in which millions of plain and enameled cans are made annually, there has been no correlation between the incidence of dermatitis and the type of cans handled. Enameled cans

for fruits and vegetables have been used for at least thirty years. If resins used in these enamels were related to occupational dermatitis, it is odd that other medical reports incriminating them are not available.

The vinyl resin used for cans is made from vinyl chloride and acetate. It is devoid of plasticizers, such as are used in elasti-glass or similar products which are rather heavily impregnated with plasticizer and to which human skin may become sensitized (Zeisler, E. P.: Dermatitis from Elasti-Glass Garters and Wrist Watch Straps, *THE JOURNAL*, June 29, 1940, p. 2540). The vinyl resin used for cans is also free, except possibly for minute traces, of the organic solvents used for spreading it. Hence the development of sensitiveness of the skin to products similar to "elasti-glass" does not appear to be applicable to the vinylite enamel used in cans.

This communication is written with the hope that any physician who has any evidence indicating that vinylite enamel used in cans is an allergen will communicate with me.

A. C. IVY, PH.D., M.D., Chicago.

ACUTE SUBDELTOID BURSITIS

To the Editor:—In *THE JOURNAL*, March 8, appears an excellent editorial concerning acute subdeltoid bursitis, with particular reference to its treatment. This consists of needling of the bursa, the effectiveness of which has been recently emphasized by Alanson Weeks. Unfortunately no citation was made of the original suggestion of Flint in *THE JOURNAL* in 1913 (Flint, J. M.: Acute Traumatic Subdeltoid Bursitis, April 19, 1913, p. 1224) of aspiration of the bursa in this condition, reporting its successful use in two cases. This omission is perhaps excusable in that no reference is made to Flint's contribution in the article of Patterson and Darrach, referred to in your editorial, and although Weeks gives credit to Flint for its use in acute subdeltoid bursitis he states that "unfortunately he said nothing about this treatment for all forms of the disease." As a matter of fact, Flint stated in his paper "It is particularly desirable to know whether or not the method is of any value in the treatment of the more chronic forms of subdeltoid bursitis," although suggesting that radical excision of the bursa may prove to be "the most successful therapeutic procedure in these cases."

Flint's method of treatment has been employed since its introduction in 1913 at the New Haven Hospital, with success in the great majority of instances. It was assumed that the matter had been adequately presented in *THE JOURNAL* and that it was being employed elsewhere. The rediscovery of aspiration with or without modification in subdeltoid bursitis would seem to indicate that the contrary is the case.

SAMUEL C. HARVEY, M.D., New Haven, Conn.

CORTICAL EXTRACT FOR BROMIDE INTOXICATION

To the Editor:—In the March 1 issue of *THE JOURNAL* is a communication from Alfred Gilman, Ph.D., of Yale University, objecting on theoretical grounds to the use of adrenal cortex extract in the treatment of bromide intoxication as described by Bondurant and Campbell in the January 11 issue of *THE JOURNAL*. As adrenal cortex extract has been advocated by these authors, I would like to substantiate Dr. Gilman's theoretical objection by reporting that 5 patients with bromide intoxication, each treated with a total of 35 mg. of adrenal cortex extract and salt, failed to recover more rapidly than the usual patient treated by salt alone.

The most rapid method of eliminating bromides still seems to be by gastric lavage of the hydrobromic acid secreted by the stomach.

FREDERICK LEMERE, M.D., Seattle.

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in *THE JOURNAL*, April 12, page 1735.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Part III. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Written*. Nov. 3. Final date for filing application is Sept. 23. *Oral*. Dec. 12-13. Final date for filing application is Nov. 8. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*. April, in advance of the meeting of the American College of Physicians and June, in advance of the meeting of the American Medical Association. *Written*. Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Philadelphia, June 6-7. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*. New York, June 2; Portland, July 15; Chicago, Oct. 18. *Written*. March 7, 1942. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Washington, January. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 1640 State St., New Orleans, La.

AMERICAN BOARD OF PATHOLOGY: *Oral and Written*. Cleveland, June 2-3. Final date for filing application is May 1. Sec., Dr. F. W. Hartman, Henry Ford Hospital, Detroit.

AMERICAN BOARD OF PEDIATRICS: Chicago, May 18, following the Region III meeting of the American Academy of Pediatrics. Boston, Oct. 12, immediately following the annual meeting of the American Academy of Pediatrics. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

California October Report

Dr. Charles B. Pinkham, secretary, Board of Medical Examiners, State of California, reports the written examination for medical licensure held at Sacramento, Oct. 22-24, 1940. The examination covered 9 subjects and included 90 questions. An average of 75 per cent was required to pass. Sixty-seven candidates were examined, 58 of whom passed and 9 failed. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
University of Arkansas School of Medicine.....	(1939)		79.9
College of Medical Evangelists.....	(1939) 81.1, (1940) 80.4, 81, 81.1		
Stanford University School of Medicine.....	(1940) 80.9, 85.7

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Liability of Physician for Administration of Insulin in Insulin Shock.—The plaintiff, a boy aged 7 years who was suffering from diabetes mellitus, was placed under the defendant physician's care in February 1937. The defendant placed the boy on a diet and in September he also prescribed daily administration of 30 to 52 units of protamine zinc insulin, which administrations, after the first few injections, were given under the defendant's direction by the plaintiff's mother until the middle of May 1938. The mother made daily tests of the boy's urine and the defendant himself tested the urine for sugar and acetone about once a month. The plaintiff led an active life and attended school regularly. On the morning of May 19, the mother administered to her son 52 units of protamine zinc insulin, a type of insulin which is cumulative in effect and reaches its peak of effectiveness in twelve to twenty-four hours after administration. The plaintiff attended school that day, but in the evening a test of his urine revealed the presence of a considerable amount of sugar. Between midnight and 1 o'clock in the morning he was discovered in an unconscious condition. His mother gave him a small quantity of maple syrup, which revived him slightly so that he was able to talk. He relapsed into unconsciousness and was taken to the defendant's office, arriving there some time between 1 and 2 a. m. On his arrival he was in a cold sweat, extremely pale and very restless—so restless that he had to be held on a table. The mother, as she claimed, informed the defendant as to everything that had taken place and what she had done. The defendant felt the plaintiff's eyeballs, took his pulse and diagnosed his condition as diabetic coma. He thereupon administered at twenty minute intervals unmodified insulin, which acts in fifteen to thirty minutes and reaches its peak of effectiveness in two to three hours after administration. He administered a total of 160 units of insulin but the plaintiff grew progressively worse and more restless, and at about 5 o'clock in the morning he was seized with convulsions. During the convulsions the defendant washed out the plaintiff's stomach with "soda and water," although the defendant later testified that the fluid "also contained glucose and sugar," which procedure caused the plaintiff to vomit. According to the evidence, at no time did the defendant test the plaintiff's urine or take his temperature. The convulsions continued and about 7 o'clock that morning the plaintiff was removed to a hospital where it was found that he was in profound insulin shock and that his blood sugar content was "too low to be read or recorded." It was believed that he had sustained a cerebral hemorrhage while he was in insulin shock. The published report does not indicate what treatment was administered at the hospital, but apparently for some time he alternated rapidly between insulin shock and diabetic coma. For the next nine weeks he remained unconscious and was paralyzed. The plaintiff, by his next friend, sued the defendant for malpractice. At the time of the trial, although physically improved, "he was diabetic, partially paralyzed and an idiot with no hope of recovery and an expectancy of life of not over five years." The defendant made a motion for a directed verdict in his favor on the ground that there was no expert medical testimony tending to show that he had failed to use due care and skill in diagnosing and treating the plaintiff's condition or that the plaintiff's present condition was due to any negligence on his part. From the order of the trial court denying his motion and entering judgment for the plaintiff, the defendant appealed to the Supreme Court of Vermont, Franklin.

The evidence, said the Supreme Court, was conflicting as to the plaintiff's symptoms and condition when brought to the defendant's office. But, continued the court, on this appeal the evidence must be construed in a light most favorable to the plaintiff, and so the jury would have been justified in finding that the facts were as already stated. Likewise, the testimony of the medical witnesses was not entirely in accord. There

was medical testimony, however, that diabetes mellitus is characterized by a high blood sugar or hyperglycemia and that to relieve such condition either protamine zinc insulin or unmodified insulin may be used. The medical testimony further showed that diabetic coma, characterized by a pronounced hyperglycemia, "usually comes on gradually, the patient is quiet and unconscious, the skin is flushed, dry and hot, the breath has a characteristic odor, the pupils of the eyes are contracted, and the temperature is elevated" but that insulin shock, characterized by a low blood sugar content or hypoglycemia, appears suddenly, "the skin is pale and moist, the patient perspires freely, is unconscious and restless and almost invariably has convulsions." The medical testimony further showed that the proper treatment of diabetic coma is the administration of insulin while the proper treatment for insulin shock is the administration of some form of carbohydrate, such as dextrose, but that whether the diagnosis is diabetic coma or insulin shock it is proper to give dextrose or some other form of carbohydrate immediately, because such administration will do no material harm if the case is found to be one of diabetic coma and will tend to a cure if the case is one of insulin shock. Medical witnesses also testified that the fact that a diabetic has revived, even though but briefly, after the administration of a carbohydrate is suggestive of insulin shock. The medical witnesses also testified that it is not difficult to determine whether a patient is in diabetic coma or insulin shock by merely testing the urine for sugar, which procedure should be repeated during the period of treatment. There was also medical testimony that cerebral hemorrhage is a complication of insulin shock and may be caused by it.

The court was of the opinion that the jury was warranted, on the basis of the evidence viewed in a light favorable to the plaintiff, in finding that the defendant had failed to exercise the requisite degree of care and skill when he diagnosed the plaintiff's condition as diabetic coma when it was in fact insulin shock. The jury was also justified, continued the court, in further finding that the course of treatment which the defendant pursued was improper and harmful under the circumstances and caused the plaintiff's injury. There was evidence tending to show that the defendant failed to make a test of the plaintiff's urine, which would have informed him of the nature of the plaintiff's condition, and that he failed to administer the proper remedy called for under the circumstances but injected insulin in an injurious amount. The court, however, believed that a new trial should be had because the trial court had refused to instruct the jury, as the defendant requested, that an error of judgment does not amount to malpractice unless it is so gross as to be inconsistent with the standard of due care. Judgment for the plaintiff was therefore reversed and the cause remanded for a new trial.—*Domina v. Pratt*, 13 A. (2d) 198 (Vt., 1940).

Medical Practice Acts: Acquittal of Defendant in Criminal Court Actions Not a Bar to Revocation of License.—The defendant state board of medical examiners charged that the license under which one Sbordy was practicing medicine in the state of Florida had been obtained by the fraud and forgery of a former secretary of the state board of eclectic medical examiners, who was later sent to the penitentiary for forgery, and that Sbordy had never graduated from an approved medical school but had paid \$2,000 for the forged certificate. Sbordy was notified of the charges against him and of the date set for a hearing thereon. Prior to that date Sbordy filed an original petition in the Supreme Court of Florida for a writ of prohibition to restrain the defendant board from hearing evidence on the charges preferred against him. In his petition he pointed out that he had previously been tried before a court and acquitted on a charge of practicing medicine without a license and that an indictment against him for uttering and publishing a forged certificate to practice medicine had been nolle prossed on motion by the state's attorney after the jury had failed to agree on a verdict. The petitioner did not deny that the right to practice medicine is a valuable property right nor did he deny that the defendant board had the power, in a proper case, to revoke, suspend or annul a license to practice medicine. He did contend, however, that the prior acquittal and release in the two criminal court actions brought against him were res

adjudicata of any further hearings on the matter. The Supreme Court issued a temporary writ of prohibition and ordered the board to show cause why further proceedings before it should not be prohibited. The board filed its answer and the court then proceeded to determine whether the temporary writ should be quashed or a permanent writ of prohibition issued.

The law is well settled, said the Supreme Court, that to make a matter *res adjudicata* there must be identity of (1) parties, (2) subject matter, (3) cause of action and (4) the quality in the person for or against whom the claim is made. A comparison of the proceeding before the board with the two criminal court actions reveals that the aforementioned requirements of identity are not met. The proceeding before the board is an action to revoke the petitioner's forged certificate to practice medicine while the criminal actions were controversies between the state of Florida and the petitioner charging that he was practicing medicine without a license or practicing under a forged certificate and that he himself had uttered and published the forged certificate. Furthermore, in many jurisdictions a proceeding to revoke a license is considered a civil rather than a criminal proceeding. It has also been held in court decisions that an acquittal of a physician in a criminal court on identical charges brought against him by a medical board is not a bar to an inquiry under a medical practice act to deprive the physician of the right to practice his profession. The issue in the present case is whether or not fraud or forgery was committed by the petitioner in obtaining his license to practice, and the board of medical examiners by statute has the power to hear and determine that issue. In the judgment of the court, the prior court actions were not *res adjudicata* of the matter before the board.

The right to practice medicine, continued the court, is a valuable property right and must be protected under the constitution and laws of Florida. Likewise, the preservation of the public health is one of the duties of sovereignty and in a conflict between the right of a citizen to follow a profession and the right of a sovereignty to guard the health and welfare it logically follows that the rights of the citizen to pursue his profession must yield to the power of the state to prescribe such restrictions and regulations as shall fully protect the people from ignorance, incapacity, deception and fraud. The legislature delegated authority to the board of medical examiners to hear and determine the issue now before the court, and no substantial reason has been advanced why that board should not proceed to hear and determine that issue according to law. The Supreme Court, therefore, denied the petitioner a permanent writ of prohibition and ordered the temporary writ quashed.—*State ex rel. Sbordy v. Rowlett et al.*, 190 So. 59 (Fla., 1939).

Society Proceedings

American Medical Association, Cleveland, June 2-6. Dr. Olin West, 535 North Dearborn St., Chicago, Secretary.

West Virginia, Charleston, May 12-14. Mr. Joe Harleston, Executive Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Orthopsychiatry, Menasha, Wis.

11:1-190 (Jan.) 1941. Partial Index

- Personality Adjustment of Women Teachers. P. M. Symonds, New York.—p. 14.
- The Classroom as a Social Group: Its Reaction to the Problem Child. M. H. Finley, Winnetka, Ill.—p. 21.
- Play Interviews with Nursery School Children. Anni B. Weiss-Frankl, Baltimore.—p. 33.
- Role of the Professionally Trained Mental Hygienist in Business. T. Burling, New York.—p. 48.
- Imaginary Companions of Children. Lauretta Bender and B. F. Vogel, New York.—p. 56.
- Amphetamine (Benzedrine) Therapy of Children's Behavior Disorders. C. Bradley and Margaret Bowen, East Providence, R. I.—p. 92.
- Deviation of Social Competence in Selected Epileptics. Alice Whiteman Goodman, Skillman, N. J.—p. 104.
- Traumatic Factors in the Background of 116 Delinquent Boys. J. Lander, New York.—p. 150.
- Psychoanalytic Experiences in Public School Practice. H. Zulliger, Bern, Switzerland; English translation by Gladys V. Swackhamer, Hartsdale, N. Y.—p. 157.

Am. J. Roentgenol. & Rad. Therapy, Springfield, Ill.

45:1-160 (Jan.) 1941

- Specification of Dosage in Radium Therapy. Edith H. Quimby, New York.—p. 1.
- Cranial and Intracranial Epidermoidomas from Roentgenologic Point of View. C. W. Schwartz, New York.—p. 18.
- Leiomyosarcoma of Esophagus. L. R. French and L. H. Garland, San Francisco.—p. 27.
- Conus Arteriosus and Pulmonary Artery: Improved Method of Visualization. G. C. Cole, New York.—p. 32.
- *Roentgenologic Diagnosis of Acute Bronchiolitis (Capillary Bronchitis) in Infants. L. W. Paul, Madison, Wis.—p. 41.
- Variations in Calcification Pattern in Epiphyses: Their Nature and Significance. L. W. Sontag and S. I. Pyle, Yellow Springs, Ohio.—p. 50.
- Brachydactyly, Polyphalangism and Brachymetapodism in Moronic Individual with Microcephaly, Internal Frontal Hyperostosis and Endogenous Obesity. T. H. McGavack and H. Reinstein, New York.—p. 55.
- Roentgenologic Studies of Mucosa of Normal Terminal Ileum. F. J. Lust, New York.—p. 63.
- Thoracic Stomach: Case Report. H. H. McGee, Savannah, Ga.—p. 69.
- Diaphragmatic Hernia and Eventration: Use of Pneumothorax in Differential Diagnosis. W. B. Faulkner Jr., San Francisco.—p. 72.
- *Roentgen Irradiation in Treatment of Inflammations. E. P. Pendergrass and P. J. Hodes, Philadelphia.—p. 74.
- Statistical Study of Late Effects of Heavy Roentgen Irradiation on Healing of Skin Wounds. W. G. H. Dobbs, New Haven, Conn.—p. 107.
- Erythematous Skin Reaction Produced by Alpha-Particle Beam: Case Report. J. C. Larkin, Berkeley, Calif.—p. 109.

Roentgen Diagnosis of Bronchiolitis.—Paul discusses roentgen features of 4 cases of acute bronchiolitis in infants. The most pronounced change from normal was a uniform, bilateral emphysema involving all portions of the lungs. The heart was narrow, and the diaphragmatic leaves were depressed. Movement of the diaphragm was practically absent and breathing was carried on chiefly by the accessory muscles. The lungs were clearly overaerated. They had the appearance of being in a continuous extreme inspiratory state. Capillary bronchitis or bronchiolitis is a distinct and well recognized clinical entity in infants. It produces a definite roentgen picture based on well known pathologic observations and is not to be confused with ball-valve blocking of a large bronchus with the resulting emphysema of a more localized distribution. The similarity is such that in the earlier cases the diagnosis of foreign body in the trachea was entertained from roentgen study alone. The history of aspiration of a foreign body is frequently obtained. If differentiation is doubtful, bronchoscopy should be performed. When miliary pneumonia develops, the emphysematous appearance becomes much less noticeable, although it can still be seen on roentgenoscopic

study. It can be confused with miliary tuberculosis. Acute bronchiectasis is likely to follow acute bronchiolitis, bronchopneumonia or peribronchitis.

Roentgen Irradiation for Inflammations.—Pendergrass and Hodes analyze the results obtained in 527 patients treated for inflammatory infections. The conditions treated were bursitis, carbuncle, cellulitis, draining ears, erysipelas, erysipeloid, furuncle, gas gangrene, granuloma, telangiectaticum, herpes simplex, parotitis, pneumonia, sinusitis and verruca vulgaris. They believe that the variance in opinions concerning irradiation for inflammation is due to the absence of reliable information concerning the biologic processes following it. Normally, bacteria carry a negative electrophoretic charge. It seems possible that irradiation might neutralize this charge, rendering the bacteria inactive. Until more is known it may be postulated that the altered albumin-globulin ratio produced by irradiation enhances antibody formation. Irradiation beyond the border of infection increases the flow of blood not only in the periphery of the lesion but in the larger area of normal tissue underlying the infection. Therefore what was originally an area of passive hyperemia is probably transformed into one of active hyperemia. That such is the case seems substantiated by the throbbing and exacerbation of pain in treated areas and sudden chills and fever from four to six hours after irradiation. The active hyperemia not only increases the temperature and local concentration of electrolytes but also decreases edema by increasing lymphatic flow, all of which increase the efficiency of antibodies. The degree of fixation of an infection at the time of irradiation determines whether incision and drainage will be necessary. How irradiation reduces the pain of an infection is a problem. It may be closely associated with the rapid elimination of toxins and edema attending the artificially induced hyperemic state. Of the 90 patients with bursitis whom the authors irradiated, 64 per cent were improved within five days; for the others irradiation had little or no effect on the usual course of the infection without treatment. Of the 20 patients with carbuncle 9 obtained rapid improvement, the usual course of 4 was shortened, 5 received little or no effect and 2 died. There was a rapid improvement among 37 of the 48 patients with cellulitis and lymphangitis irradiated, the usual course of 4 was shortened and 7 experienced little or no benefit (1 of these patients died). Eighteen chronically draining ears were treated; in 6 draining ceased, in 1 it was less profuse and 11 received little or no effect. Despite their limited experience with this type of case their experience encourages the authors to continue using irradiation provided cellular destruction does not exist. Of the 36 patients with erysipelas treated 30 had marked improvement in one or two days, 1 little or no effect and 5 died. Seventeen of 21 patients with erysipeloid improved rapidly, the normal course of 1 was shortened and 3 received little if any effect. Of the 117 furuncles irradiated 85 improved rapidly, in 12 the usual course was shortened and in 20 there was little or no effect. If furuncles are irradiated before complete fixation they may regress without central necrosis after one application. Later a stab incision for drainage may be necessary. The duration of the infection in late cases may be shortened 50 per cent by roentgen therapy. Only 3 patients suffering from gas gangrene were treated; 2 died. They were moribund at the time of irradiation. Available data indicate that the earlier patients with gas gangrene are irradiated the better the prognosis. The results in the 6 patients having pyogenic or telangiectatic granulomas were excellent. All but 1 of 11 patients with herpes simplex were definitely benefited by irradiation. Occasionally, burning and biting sensations cease within twelve hours of exposure. The vesicles dry rapidly. The usual course of the disease is shortened. Of 27 patients with postoperative parotitis treated 14 had marked rapid improvement, 2 moderate, 3 little if any and 8 died. Irradiation of acute parotitis is a roentgen emergency. The best results are obtained if treatment is given immediately after the diagnosis was made. When surgical drainage is necessary from 75 to 100 roentgens hastens resolution and healing. Of 24 children with sinusitis treated 20 obtained complete, 2 moderate and 2 little or no relief of symptoms. The corresponding figures for 98 adults are 23, 19 and 56. Most patients with warts on the feet (65 per cent of

the cases of plantar warts) present themselves in the spring and early fall. This suggests that seasonal changes in shoes produce unusual pressure, which may account for most cases of verruca plantaris. Unless proper shoes or supports are employed to relieve the irritation, treatment is not satisfactory. In their experience from 2,000 to 2,500 roentgens delivered to the surface of the skin at one time has produced an excellent result in 98 per cent of cases. Further irradiation of those patients who have had previous roentgen or radium treatment and to some who have had surgical care may produce a chronic ulcer. With the rapid development of chemotherapy for the treatment of pneumonias, radiologists should direct their attention particularly to those pneumonias which do not respond to chemotherapy.

Specificity of Serologic Tests for Syphilis.—Eagle attempted to determine what proportion of normal, nonsyphilitic persons with no apparent complicating disease give repeatedly positive or doubtful reactions, and whether the proportion is sufficiently large to invalidate positive reactions even when definite clinical evidence or history of syphilitic infection is absent. Young persons (white college students) in whom incidence of syphilis is thought to be small were chosen for the study. Twenty-five schools participated and a total of 40,545 initial specimens from as many students was examined. The tests used represented a fair cross section of those currently used. All specimens giving positive or doubtful results were rechecked and, when feasible, the student in question was studied from the point of view of syphilitic infection. Among the 40,545 students there were 73 initially positive and 117 initially doubtful tests; 33 and 95 respectively were assumed to be due to laboratory error because subsequent specimens were negative. This left 40 positive and 22 doubtful results, a combined incidence of 0.15 per cent. Sixteen of the positive and 5 of the doubtful results were obtained in students who had been, or could now be diagnosed, as syphilitic on the basis of clinical observations (8 congenital syphilis, 1 central nervous system syphilis and 12 early acquired syphilis). In 5 other students with positive tests there was a definite history of antisyphilitic treatment with no information as to why the treatment was instituted. The remaining 19 positive and 17 (36 or 1 in 1,125 tested) doubtful reactors would ordinarily be diagnosed as having and being treated for latent syphilis but might also be regarded as individuals giving biologic false positive reactions in the absence of syphilitic

infection. However, the correlation between the incidence of clinically proved syphilis and these putative false reactions in the individual schools was so high (ungrouped coefficient of correlation 0.83) as to suggest that approximately 26 (70 per cent) of these clinically unconfirmed reactions actually represented latent syphilis. It is possible that the remaining 10 cases (an incidence of 1 in 4,000 tested) represented latent syphilis, false positive reactions due to an unrecognized intercurrent infection or biologic false positive reactions among normal persons. This incidence seems sufficiently small to justify, as a general public health measure, the diagnosis of syphilis in clinically normal persons on the basis of repeatedly positive serologic tests, even when a history or clinical evidence of syphilitic infection is absent. In the individual case or in population groups in which the incidence is known to be small, attempts should be made to differentiate between a possible biologic false positive reaction and one due to latent syphilitic infection.

Temperature Swing in Treating Dementia Paralytica.—Solomon and his colleagues determined the effect on spirochetes of wide swings of temperature in 8 patients with dementia paralytica. The temperatures of the patients were first lowered and then raised as rapidly as possible with the fever cabinet and inductotherm. Thirty-seven such treatments were given. In reducing the temperature the authors followed the technic of Fay. The patient was prepared by a cleansing enema on the evening before, and without breakfast was placed in the fever cabinet with the cover open. After ten or fifteen minutes for stabilization of the temperature (read by means of a constantly recording rectal thermometer), from 7 to 10 grains (0.45 to 0.65 Gm.) of sodium ethyl (1 methylbutyl) thiobarbiturate administered produced a satisfactory anesthesia. Approximately 100 pounds (45 Kg.) of finely cracked or shaved ice was placed about the patient from the axillas to below the knees, excluding the back. One arm was kept exposed for blood pressure readings and subsequent venipunctures. From time to time the anesthetic agent was injected in decreasing doses to maintain anesthesia. When the temperature fell to approximately 90 F. the ice was removed, the body dried and wrapped in warm blankets and the cabinet cover lowered and the heat turned on. After the patient's temperature began to rise, the inductotherm was turned on and temperature of the cabinet was maintained between 102 to 105 F. until the patient's rectal temperature was between 104 and 105 F. The cabinet was then opened and the body temperature allowed to return to normal. The swing in temperature was readily effected and caused no noteworthy disturbance. A few hours after the treatment the patient was able to be up and about and apparently had no delayed symptoms or discomfort. The temperature may be dropped, raised and brought back to an approximately normal level in about six hours. There appeared to be definite relationship (as yet unknown) between the depth of anesthesia and the rate of temperature decline. Several factors probably play a part; the deeper the anesthesia, the lower the metabolism and therefore the less heat created. Also there probably is an increase in superficial vasodilatation with the result of greater cooling, and the anesthetic may not only produce generalized muscular relaxation but also may paralyze the heat-regulating mechanism in the hypothalamus. When the ice is removed from patients requiring a third dose of the anesthetic, a sudden precipitous fall of from 1 to 3 degrees F. was observed. The phenomenon is not clear and may be related to the depth of anesthesia. After the ice is removed and an attempt is made to raise the temperature, shivering makes its appearance as the temperature rises. In some cases it became violent, but became modified or disappeared when the temperature reached approximately 94 or 95 F. Patients have no unpleasant recollection and none objected to a second treatment. The amnesia is apparently due to the anesthetic and not to the lowered temperature alone. The anesthetic during the low body temperature not only dulls the cerebral centers but also lessens the discomfort of the raised temperature. This factor cannot be measured but has been observed in every case. The authors point out that the efficacy of the method in comparison with ordinary artificial therapy cannot be stated before a large group of patients have been similarly treated.

Gordon Test in Hodgkin's Disease.—Among 21 established cases of Hodgkin's disease the Gordon test was positive, according to Steiner, in 16, or 76 per cent. The results of the test obtained from control tissues from 40 cases of lymph node disease of types which must commonly be differentiated from Hodgkin's disease were uniformly negative. The test was therefore reliable in that it excluded nonlymphogranulomatous diseases, but it did fail to detect some instances of Hodgkin's lymphogranuloma. Before accepting the failure of 24 per cent at its face value, the author believes it is well to consider that this figure is derived by using a standard which is not without error, since all experienced histopathologists recognize that microscopic diagnosis of lymph node diseases requires a correction factor of variable amount. Thus two variables have been compared. Of 452 control cases collected from the literature, positive reactions were reported in 8 (1.77 per cent); however, in most, if not all, of them the involved tissue could have been differentiated from Hodgkin's lymphogranuloma by microscopic criteria. The Gordon reaction is consequently reliable in differential diagnosis of lymph node diseases if it is accompanied by microscopic examination and it differentiates closely related types of lymphadenopathy. The distribution of the Gordon agent is such as to make it unlikely as the etiologic agent of the disease. Its properties are those of a nonliving agent, probably enzymatic. The test, while reliable, is therefore nonspecific.

Pulmonary Embolism and Infarction.—Loeffler describes experiments on pulmonary infarction in guinea pigs and rats which he believes further clarify their purely anatomic problems. Tying a string fairly tight around a lobe of the lung produced hemorrhagic infarction; tying a string quickly and tightly produced anemic necrosis. Stoppage of the blood supply to the kidneys, liver, lungs and intestine produced anemic necrosis, an observation applicable to any organ. A hemorrhagic infarct requires a continuous blood current and increased venous pressure. The continuous flow is maintained either by collaterals, as in the lungs, or by incomplete occlusion of the arteries, as in the intestine. Occlusion of the pulmonary artery at any point of its course does not, as a rule, cause serious disturbance of the pulmonary tissue, because there is sufficient collateral circulation through the bronchial arteries. The anemic and the hemorrhagic infarct in lungs represent exceptions to this rule.

Mammary Discharge and Papilloma.—Gray and Wood discuss the significance of discharge from the nipple in cases of mammary papilloma. Their statements are based on data from 227 cases. The average age of 109 patients with benign papilloma was 46 years; the youngest 19 and the oldest 78. All but 1 were women, 80 per cent of whom had been married. A family history of carcinoma was related by 19 per cent. The chief complaint of 87 per cent on admission concerned the breast. The complaint of 81 per cent was specifically of discharge (serous, hemorrhagic or serohemorrhagic) from the nipple for an average of a year and four months. A tumor was palpable in only 28 per cent. Simple mastectomy was done in 83 per cent, local excision in 6 per cent, radical mastectomy in 1 case and bilateral simple mastectomy in 10 cases. The average age of 118 patients with malignant papilloma was 47 years; the youngest 19 and the oldest 87. Only 1 patient was male. Of the women 88 per cent had been married. The male patient had had a serous discharge from the nipple for seven months. It was not associated with a palpable tumor. On examination a carcinomatous papilloma of grade 3 was found. A family history of carcinoma was related by 24 per cent. The patients had recognized that an abnormal mammary condition existed for an average of two and a fourth years before coming to the clinic. The chief complaint of 91 per cent on admission concerned the breast; 74 per cent complained of serous, hemorrhagic or serohemorrhagic discharge for an average of twenty-one months. Slightly more than half of the patients had palpable tumors and 52 patients noticed a discharge in its absence. The tumors of 44 of these patients were classified as papillary adenocarcinoma grade 1, of 7 as grade 2 and of 1 as grade 3. Simple mastectomy was performed on 46 per cent or 54 of the 118 patients and radical mastectomy on 53 per cent or 63 patients. One patient was subjected to local excision only, but this was later followed by radical mastectomy. The lymph nodes of only 3 patients were involved. Fifty-four patients received postoperative roentgen therapy and 16 returned for further surgical treatment (one local excision of nodules on the same breast, eight simple and seven radical mastectomies). There were no deaths in the hospital, but 3 patients died within three, one and nine years, respectively, as a result of recurrence or metastasis. All of these had primarily undergone radical mastectomy. The authors suggest that it is imperative that discharge from the nipple, regardless of its character, in the presence or absence of a demonstrable tumor, be given serious consideration and that in most instances surgical intervention be advised to determine the nature of the lesion.

Obstruction After Gastroenterostomy or Gastric Resection.—Hoag and Saunders believe that the incidence of obstruction after gastroenterostomy or subtotal gastric resection is not "occasional," which fact is evidenced by the constant change in procedures in an endeavor to avoid its occurrence. Obstruction after gastroenterostomy may occur from one or more of the following causes: an improperly placed stoma, a stoma so narrow or small as to produce acute angulation of the jejunum, a proximal loop that is either too long or short so as to cause obstruction when the position of the stomach changes, inadequate fixation of the stomach to the mesocolon and internal hernia, adhesions about the stoma, a rigid and short mesocolon which fails to stretch as the stomach fills, pressure of the middle colic artery, marginal or jejunal ulcers at or near the stoma, adhesions distal to the anastomosis and hypoproteinemia. All these factors, except distal adhesions, are operative in the immediate vicinity of the anastomosis. For the early stages of every obstruction the authors suggest gastric lavage, careful water balance (maximal dextrose and limited salt), 250 cc. or more of protein daily in the form of whole blood or blood serum to combat hypoproteinemia and feedings of thick gruel after the stomach has contracted and the dextrose, protein, salt and water balance is corrected. When these measures fail, jejunoplasty is recommended for relieving the acute obstruction at the level of the stoma. The procedure requires a minimal amount of operative handling and has given effective and prompt relief. It can be completed with no more shock or time than an enteroanastomosis. It possesses the advantages of direct inspection of the stoma and correction at the site of obstruction. It should be much more valuable than the usual jejunostomy or enteroanastomosis and should carry no greater operative risk. The authors do not believe that the jejunoplasty will increase the hazard of jejunal ulcer, as it is designed to increase the lumen of the jejunum and to correct the faulty initial anastomosis. The possibility of marginal ulcer always exists with any gastrojejunal anastomosis. The authors suggest jejunoplasty for gastrojejunal or jejunal ulceration when more radical surgical treatment is contraindicated. They do not suggest jejunoplasty as a substitute for partial gastric resection in the treatment of marginal ulcer but only when the latter operation is contraindicated. It should be of special value when a marginal ulcer has developed after gastric resection and occasionally for the closure of a perforated jejunal or gastrojejunal ulcer.

Silk Sutures for Infected Wounds.—Cutler and Dunphy compare the healing of operative wounds sutured with silk and those closed with catgut in animals. Under sterile conditions, parallel wounds were made in an animal's abdomen. These were contaminated with equal amounts of bacterial culture, and one wound was closed with silk and the other with catgut. Only 50 per cent of the silk wounds' suppurred, whereas 100 per cent of the catgut wounds opened and discharged a purulent exudate. The infection in the catgut wounds always appeared earlier and was more severe. Healing occurred at about the same time in the two types of wounds that opened. Although some of the silk sutures were extruded from the wounds, healing occurred without delay and the removal or discharge of all the sutures. If heavy silk or continuous sutures were employed, all the silk often had to be removed from the wound before healing was complete. The use of fine black silk (No. 4 Gudebrand) in the clinic in potentially infected and grossly infected surgical conditions, generally in biliary and alimentary tract cases, gave better results than those obtained when catgut was used. Sutures were discharged in 7 per cent of the authors' 263 cases, but the amount of wound infection and the small incidence of hernia, only about colostomy openings, are favorable signs. In 3 per cent of cases of chronic cholecystitis silk sutures were discharged from the wound, and in 11 per cent when an acute infectious condition was being dealt with, but in these cases there were no instances of hernia or disruption and none of the wounds were seriously involved by infection. In gastric, including the duodenum, and cancer cases with gross contamination of the wounds, there was no trouble with the wound—infection, hernia or the discharge of silk sutures. Of forty-three operations on the large intestine 2 per cent of the wounds discharged some silk sutures. Hernia developed in 2 cases; 1 about a colostomy opening and the other about a Mikulicz procedure; in each of these operations the discharge of fecal contents usually, but not always, seriously contaminates the wound. In gynecologic operations (20 cases) some silk sutures were discharged in wounds closed without drainage, but the usual convalescence was so smooth that the authors have become better satisfied with silk closure than with catgut. Of 55 cases of acute suppurative appendicitis (including perforated appendicitis with diffuse peritonitis, gangrenous appendicitis with purulent fluid and local peritonitis and appendicitis with abscess formation) 39 wounds healed promptly in from twelve days to four weeks, average twenty days. In 2 cases the continuous silk suture used in the peritoneum was discharged before the sixteenth postoperative day. There were 14 cases of delayed healing. Only 2 of these patients were seriously incapacitated because of continued trouble with the wound, and only 4 had to return for dressings after discharge from the hospital.

Femoral Vein Ligation and Postoperative Pulmonary Embolism.—The syndrome discussed by Sears is more serious than the iliofemoral thrombophlebitis (milk leg) and peripheral thrombophlebitis, in which an adherent thrombus is more likely. In the syndrome discussed, clotting apparently begins within the veins among the calf muscles and may progress rapidly to the femoral region or higher. The danger lies in the loosely

attached thrombus or its free-floating propagating tail that breaks off and journeys to the heart and lungs. The onset is usually mild and insidious. The patient sometimes complains of pain in the calf or heel. The duration and intensity of the pain vary. In most patients it lasts from two to eight days. It may disappear after several days, only to be followed by embolism or pain in the femoral region signifying extension to the femoral or iliac vein. There is tenderness on deep palpation of the calf muscles. Forceful dorsiflexion of the foot causes pain in the calf or popliteal area. In the author's 10 cases the complication was associated with no particular type of operation. The first manifestation of pain in the calf appeared from five to fifteen days after operation, average eleven days. The diagnosis of deep thrombosis was made after infarction or embolism in 3 cases. The author believes that deep thrombosis in the calf occurs more frequently but is less often recognized than iliofemoral thrombosis, and that it is the more frequent source of pulmonary embolism. Deep thrombosis does not always result in embolism, but, because it may, it is the author's policy to divide and ligate the femoral vein when the diagnosis is made. The vein is divided even if the diagnosis is made after infarction or embolism has taken place, for the accident is likely to recur. Division removes the danger of embolism and prevents extension beyond the operative site. The patient becomes ambulatory earlier. The operation is performed under procaine hydrochloride infiltration. A vertical 10 cm. incision is made in the femoral triangle over the femoral impulse. On exposure the vein may appear and feel normal. A silk ligature is tied distal to the profunda vein or other large tributary, and the vein is opened below this point. The amount and speed of hemorrhage indicate the extent of venous occlusion. If the vein is firmly thrombosed and surrounded by inflammatory exudate, the operation is without prophylactic value. Since this thrombophlebitis is considered the source of a vasospastic reflex, one of the most important factors in producing clinical manifestations, a portion of the involved vein should be resected. The author believes that some of the operations in his small series of cases prevented embolism and therefore justified those which may have been unnecessary.

Roentgen Therapy for Psoriasis.—Popp and Addington used roentgen therapy for the treatment of 24 unquestionable cases of psoriasis of the nails. Of 6 only the fingernails were involved and of 18 the nails of both the hands and the feet. Nine of the 24 patients had arthritis of the distal joints. With the development of the psoriasis of these 9 patients there was usually a definite exacerbation of the arthritis with pain and periarticular swelling. Roentgen studies showed only some periarticular swelling. The average duration of symptoms of the 24 patients was approximately seven years, with a minimum of three months and a maximum of twenty years. The roentgen rays were applied to the dorsum of the hands in a field extending from the nail tips to the wrists, and

to the dorsum of the feet in a field from the tips of the nails to the ankles. The treatments are given with the rays generated at approximately 130 kilovolts with a constant potential, filtered through 4 mm. of aluminum for the hands and through 6 mm. of aluminum for the feet. The dose for each treatment is about 300 roentgens. The treatments are usually repeated twice, at monthly intervals. At least three months must be allowed to elapse before the results can be evaluated. In the cases complicated by arthritis symptomatic improvement has been manifest after the first treatment, but at times an exacerbation of pain and stiffness was observed the first few days after treatment. This exacerbation can be disregarded as it subsides quickly. Six of the patients have had a complete remission of all changes in the nails with no exacerbation to date, 10 showed obvious improvement requiring no subsequent treatment and the lesions in the nails remaining quiescent and 2 patients have had no improvement. Of the 9 patients with arthritis 1 could not be traced, 4 obtained complete symptomatic relief and 4 much improvement. The beneficial results have lasted from six months to five years. The authors do not recommend roentgen therapy as a cure for psoriasis of the nails and psoriatic arthritis. As the natural course of psoriasis is toward recurrence under any treatment the beneficial effect, even though pronounced, will at best be only temporary. The same difficulties will probably arise with repetition of roentgen treatment as have arisen in the treatment of psoriasis of the skin.

Surgical Aspects of Lightning Stroke.—Crawford and Hoopes report a case of lightning stroke with recovery from lesions formerly resulting in death. On admission to the hospital, about one and a half hours after the accident, the patient appeared to be in deep shock, but still her blood pressure was 120 systolic and 80 diastolic and her pulse 72. She had no respiratory embarrassment. Her clothes were torn and burned. The hair over the right parietal and mastoid areas was singed, as were the eyebrows and eyelashes. The right ear was almost completely torn off and its upper third was missing. There was a 4 by 2 cm. irregularly charred and macerated laceration of the skin in the right mastoid region. The mastoid bone also appeared to have burst, and its edges were jagged and charred. Sanguineous spinal fluid dripped from the canal of the right ear. The entire right side of her face and neck was covered by a first degree burn, and there was a second degree burn over most of the anterior wall of the chest. Both wrists had small second degree burns and were lacerated. The skin over the pubes had several small lacerations and a second degree burn. The pubic hair was singed. Shock promptly disappeared. Gradually she regained consciousness, and about six hours after the accident she was able to answer simple questions but remained stuporous and quiet. The burns were tanned with resorcinannol jelly and healed as rapidly as those acquired by other means. Sulfanilamide was started on the day after admission as a prophylactic measure against menin-

gitis. The patient's rectal temperature remained around 100 F. for four days and then suddenly rose to 104 F., at which time she became more stuporous and had questionable neck rigidity. Daily lumbar punctures were done for six days. Cultures of the spinal fluid were negative. Sulfanilamide therapy was continued, and hypertonic dextrose was given intravenously periodically. She was placed in an oxygen tent, and during eleven days five small transfusions were given. After spinal drainage was started, she gradually improved. The laceration behind the right ear, which was carefully debrided on admission, healed without infection and the remaining portion of the ear attached itself in spite of the meager blood supply. Fluid stopped draining from the ear on the seventh day. She was discharged thirty-four days after injury. Her vision was good and her husband noted no personality changes. Hearing was fair in her left ear but poor in the right, with almost complete nerve deafness. The right eardrum appeared definitely scarred in the posterior quadrant. Although at the time of débridement it was not possible to approximate the edges of the skin of the mastoid wound, it healed normally. The skull fracture was not verified roentgenologically, but the cerebrospinal otorrhea gave clinical proof. The cerebrospinal otorrhea probably ceased because of the prophylactic use of sulfanilamide.

Splenectomy for Splenomegaly Associated with Anemia.—According to Wilensky, hemolytic erythrocyte destruction is not always due to the same factor, nor is the same laboratory evidence always present in cases which apparently possess similar clinical manifestations. Three groups of cases, based on the reaction of the patient to splenectomy, are clinically discernible. They are (1) cases in which the indication for splenectomy is sharply defined (such as hemolytic icterus with spherocytosis and thrombocytopenic hemorrhagic purpura) and in which a permanent good result (cure) can be expected, (2) cases in which the indication for splenectomy is a symptomatic one and is justifiable in order to relieve the bleeding tendency but in which the underlying disease (as Gaucher's disease) is uninfluenced by the splenectomy and (3) cases in which the indication for splenectomy is a doubtful one, the outcome unpredictable and the operation is commonly done because a more conservative (medical) form of therapy is not available. This third group is represented by cases with indefinite manifestations and the impossibility of definitely classifying the essential lesion. The term Banti's disease may be appropriate in that the modern concept of Banti's disease is that of a terminal entity which results from a number of related or essentially different preceding conditions. In the absence of any sharply demarcating signs, symptoms or laboratory facts the indication for splenectomy is an empiric one. The final outcome in such cases cannot be foretold. The author's patient (whose pathologic study was suggestive of leukemia) has done reasonably well after splenectomy and has had no complaints but continued observation is necessary before any definite opinion can be drawn. In the first two types of cases operation is best during a period of remission, when a good result is to be expected.

Ovulation Determined by Endometrial Biopsy.—In determining how frequently anovulatory cycles occur in women not complaining of sterility, Morton and Hayden studied the endometrium obtained at operation on women admitted to the gynecologic wards for conditions other than sterility and the endometrium obtained during successive cycles from young women who presented no gynecologic complaints and whose menstrual periods were essentially normal. The 239 endometrial specimens studied were obtained from women (not complaining of sterility) between 20 and 49 years of age. The specimens were obtained at least twenty days after the beginning of the last menstruation. All cases in which there was a diagnosis of endometrial hyperplasia or of uterine or cervical cancer were excluded. An effort was made to determine whether the specimen was typical of the secretory or of the follicular phase. It was found that 169, or 70.7 per cent, of the total specimens were of the secretory type. That is to say, in almost one third of the 239 cases anovulatory cycles occurred. If abnormal groups are excluded the incidence of anovulatory cycles is much lower, 14.6 per cent for the specimens from women having essentially normal periods and 7.4 per cent for the endometrium specimens from women less than 40 years of age having had one or more pregnancies and normal menstrual periods. It is not possible to prove that the women who had anovulatory cycles always have them or that the women who had ovulatory cycles always ovulate, but it seems highly probable that all women occasionally fail to ovulate, and probably more often as they grow older. Anovulatory cycles among women who were more than 40 years of age rose sharply. Study of the endometrium obtained in 142 successive cycles usually within five days of the onset of the next period from 33 young women, all of whom were perfectly healthy and menstruating normally, revealed 5 patients with one anovulatory cycle. In 1 additional patient two successive anovulatory cycles occurred. The ages of these 6 patients were between 21 and 25 years. In no instance among the 33 patients were only anovulatory cycles found. Therefore in these endometria there were variations in the degree of follicular and of secretory activity which could not be related to the time in the cycle at which the specimen was obtained. The authors believe that these variations point to differences in hormone balance or to differences in the reactivity of the endometrium in different individuals at different times. The study indicates that in the presence of regularly recurring periods the chance of any one cycle being anovulatory is probably not more than one in ten up to the age of 40 years. With approach of the menopause, that is after the age of 40, the incidence of anovulatory cycles increases considerably. Even in women in the 40 or 49 age group, however, ovulation occurs surprisingly often: the figures indicate roughly 50 per cent of ovulatory cycles. Thus the presence of essentially regular menstruation can usually be interpreted as an indication of normal, regular ovulation in women less than 40 years of age. However, the figures indicate that probably all women have an occasional anovulatory cycle. The observations minimize the importance of endometrial biopsy in sterility investigations in normally menstruating women. The finding of various degrees of secretory response in the endometrium in the late premenstruum suggests a possible cause of sterility. When the endometrium does not attain the full secretory stage in the late premenstruum it may well be unsuitable for nidation and thus lead to the death of the fertilized ovum. Women in spite of having such conditions as fibroids with menorrhagia, menorrhagia alone, very irregular periods, endometriosis and pelvic inflammatory disease ovulate fairly often.

Rectal Hexobarbitone Soluble.—Boston and James used hexobarbitone soluble by rectum as a basal anesthetic for 250 patients undergoing various surgical operations. Rectal hexobarbitone is administered in such a small volume of solution (20 to 30 cc.) that its ejection has not occurred, even in young children. This is of considerable advantage in dealing with emergency operations when enemas are impossible. Another advantage is that tests for decomposition of the solution are not necessary. The dosage of hexobarbitone for adults varies according to whether there has been premedication with atropine only or also with morphine or pantopon. When atropine is the sole premedication the patient's actual or estimated weight (in pounds) is multiplied by 0.02. The result gives the number of grains of hexobarbitone soluble to be administered in warm tapwater. If other premedication has been given in addition to atropine, the patient's weight is multiplied by 0.01 or 0.015 according to his type, age and condition. When morphine or pantopon has been given the basal narcosis is more satisfactory and is less likely to be followed by postoperative restlessness. Children of 10 months or older must be weighed accurately and the weight multiplied by 0.02 to give the required dose. In contradistinction to the procedure in adults, when the injection is completed the catheter is cleared by means of a few cubic centimeters of warm tap water, clamped and left in situ until the child is asleep, as immediate withdrawal may cause expulsion of the fluid. As in adults, the lateral position must be insisted on until the child reaches the operating room. The advantages of the method are that there is complete amnesia of the journey to and from the operating room and for some hours afterward, less inhalation anesthetic is required, postoperative vomiting seems to be less than when inhalation anesthesia alone is used, hexobarbitone soluble is easy to prepare and administer and ejection does not occur, and the method is suitable for combination with local infiltration and block anesthesia. When injecting a local anesthetic into a patient under this form of basal narcosis one should first strap down the limbs, as the patient is liable to move in response to the needle prick. These advantages make the method suitable for service patients under war conditions. The only untoward effects observed have been

restlessness in a few patients, undue respiratory and circulatory depression of 2 patients and possibly prolonged postoperative unconsciousness. The contraindications are those which apply to basal anesthesia in general.

Effect of Potassium Salts on Cardiac Irregularities.—Castleden states that potassium salts caused the extrasystoles associated with insulin hypoglycemia of 1 patient and those of spontaneous origin in 4 to disappear. In 3 of these 5 patients the level of potassium in the serum was estimated, and the disappearance of the extrasystoles was associated with a rise in potassium level. Attempts to produce extrasystoles by the administration of ephedrine were not successful. In contrast with insulin and epinephrine, ephedrine does not produce a consistent fall in the serum potassium. The author warns that since potassium salts have been reported to produce cardiac irregularities in experimental animals and to increase the incidence of extrasystoles and paroxysmal tachycardia in some patients, their action in suppressing extrasystoles cannot be utilized with confidence until further work has clarified the mechanism of these effects.

*Estrogen and Calcium in Menopause. B. Sorrentino.—p. 588.

Estrogen and Calcium in Menopause.—Sorrentino reports satisfactory results with combined treatment of estrogen and calcium in menopausal disorders, especially in cases in which there are nervous hyperexcitability, hypertension and hypocalcemia. The latter is the cause of menopausal vasomotor disorders. He administered three times daily crystallized estrogen up to a total dose of 0.00003 Gm., 0.00025 Gm. of calcium lactate and 0.000005 of sodium bromide. The number of treatments cannot be fixed. The treatment is discontinued on the relief from symptoms. This takes place early in the course of the treatment. Endocrine treatment must not be administered for a longer period than is necessary. In patients with thyroid disturbances it is advisable to administer thyroid along with calcium and estrogen.

*Tuberculin Allergy of Patients with Exudative Pleurisy. S. Kanai, S. Arisue and H. Shimidzu.—p. 685.

Tuberculin Allergy in Pleurisy.—Kanai and his co-workers report the results of their observations from the point of view of allergy in over 600 patients with exudative pleurisy. An attempt is made to correlate the data derived from intracutaneous tuberculin tests, erythrocyte sedimentation rates, serial roentgenograms and physical examinations. These investigations are summarized as follows: 1. Exudative pleurisy manifests itself during the hyperergic stage, although it can also occur at the stage in which the tuberculin reaction is weakly positive. The constitutional factor plays an important part in its pathogenesis. 2. Simultaneous with the pleuritic attack, the tuberculin allergy subsides, and the majority of patients are brought to physicians at this stage. 3. During the height of the disease the tuberculin allergy is only weakly positive with a dilution of 1:1,000; a lower dilution is apt to give more strongly positive reactions. 4. The tuberculin test resumes its strong reaction with the absorption of the exudate and the recovery of the patient from the attack. 5. In cases of severe pulmonary tuberculosis, tuberculous polyserositis and meningitis, the tuberculin allergy is not only weakened but frequently negative in reaction. 6. The degree to which the tuberculin test is positive roughly parallels the increased rate of erythrocyte sedimentation. 7. While the majority of patients show positive tuberculin tests on recovery from attacks of pleurisy, there are a few patients whose reaction remains weak. 8. Nephritis frequently complicates the recovery stage of tuberculous pleurisy, coincident with the return of positive tuberculin reactions. 9. In 3 patients with exudative pleurisy the tuberculin test performed by intracutaneous injection of undiluted tuberculin remained completely negative, suggesting a nontuberculous nature of the disease. 10. Repeated tuberculin tests of patients with exudative pleurisy are useful procedures in diagnosis and prognosis.

*Tuberculous Bacilluria in Phthisis. G. Iwamae.—p. 896.

Tuberculous Bacilluria in Phthisis.—Iwamae took cultures of catheterized specimens of urine from 160 patients suffering from pulmonary tuberculosis on Petraghani-Suzuki's medium and obtained positive cultures in 9 cases. In 4 of these patients the complication of urogenital tuberculosis was later demonstrated, either at necropsy or on operation; the remaining 5 patients were in advanced stages of the disease, and the coexistence of urogenital tuberculosis may be presumed. These 9 patients belonged to a group of 26 tuberculous subjects whose urine on laboratory examination gave consistently positive results. Only 1 specimen of the remaining 134 negative urines showed the presence of tubercle bacilli on culture. During the thirteen months of observation, cultures of the urine of the last mentioned patient were taken on six different occasions, with positive results at each trial. Ten months after the first examination his urine began to show some positive results

(albumin and leukocytes) which the author interpreted as being a sign of incipient renal tuberculosis. From these observations Iwamae concludes that the demonstration of tuberculous bacilluria is a diagnostic sign of urogenital tuberculosis.

Cutis Verticis Gyrata. S. Radner.—p. 425.

Simmonds' Syndrome.—Mogensen suggests that Simmonds' disease may be caused by any process which destroys the anterior pituitary and that the fundamental morbid process is so varying as to suggest the propriety of the term Simmonds' syndrome. The syndrome is a chronic, progressive disorder due to failing of the endocrine function of the anterior lobe of the pituitary and is characterized by the deficiency symptoms produced thereby. The principal clinical symptoms are loss of weight, asthenia, atrophy of the genital organs with decreased sexual function (in women amenorrhea and in men impotence), loss of the axillary and pubic hairs (in men also the beard), changes in the skin and decreased basal metabolic rate. Hypotonia, hypothermia, bradycardia, hypoglycemia, gastrointestinal disorders, anemia and achlorhydria may also appear. Cachexia is a late phase of the disease and by no means a necessary symptom. If the diagnosis is not made until cachexia appears, it is a late one. The pathologic changes besides those already mentioned are atrophy of the pituitary, skin, sexual glands, thyroid, parathyroids and adrenals. In advanced cases the internal organs are atrophied. The author believes that the main symptoms of the disease may be ascribed to a decreased secretion of the hormones of the anterior pituitary lobe; the loss of weight and the splanchnomelia to lack of the growth hormone; the genital atrophy, loss of hair and presenility to lack of gonadotropic hormones, and hypoglycemia to lack of the diabetogenic hormone. The decreased basal metabolism is possibly due to a decrease of the thyrotropic hormone, but it is also possible that the symptom is due to a decrease in the specific dynamic value of the proteins (Plaut, and Goldzieher and Gordon). The reduced blood pressure may possibly be due to adrenal insufficiency. The anemia is possibly caused by the lack of hemopoietic pituitary hormone or possibly to an existing achlorhydria. Many symptoms of Simmonds' syndrome cannot be as yet explained satisfactorily, as knowledge of the functions of the pituitary is still meager. In the differential diagnosis the conditions that should be considered are pluriglandular insufficiency, myxedema, Addison's disease, eunuchoidism, forms of emaciation terminating in cachexia and especially anorexia nervosa. In general anorexia nervosa has a far more benign course than has Simmonds' disease, and many such patients have recovered within a short time under varying forms of treatment. There are numerous reports of the successful treatment of the disease which were obviously cases of anorexia nervosa. Of the many types of treatment used the most promising results have been obtained with gonadotropic substance from the urine of pregnant women. The author has produced and maintained a pronounced improvement of the general condition and endocrine deficiency symptoms in 2 male patients with Simmonds' disease by intense treatment with gonadotropic substance. In a third patient, a woman, this treatment failed, probably because the ovaries during the long period of disease had no reactive tissue remaining. Treatment of this patient with estrogen was accompanied by partial improvement. In the 2 male patients it has proved necessary to continue the treatment with a maintenance dose. The treatment is not really substitution therapy, as the preparation used is a chorionic hormone, but it seems to replace the lacking gonadotropic hormone. Gonadotropic substance also appears promising for related conditions (pituitary tumors and hypopituitarism), which until recently have been called intractable.

Book Notices

Diseases of the Digestive System. Edited by Sidney A. Portis, B.S., M.D., F.A.C.P., Associate Clinical Professor of Medicine, Rush Medical College of the University of Chicago, Chicago. Cloth. Price, \$10. Pp. 952, with 176 illustrations. Philadelphia: Lea & Febiger, 1941.

This is a textbook on diseases of the digestive system in which every chapter is written by a different man. In many ways this is a good idea, because the field of even one specialty like gastroenterology has become too large to be well covered by one man.

The first chapter is by Ralph Major, who writes on the history of man's acquisition of knowledge in regard to gastrointestinal disease. Then follow a chapter on the anatomy of the tract by De Garis and one on physiology by Necheles. A useful chapter is one on the interpretation of abdominal pain by Chester Jones, who has done research in this field. It is good to see four chapters on the neuroses and the neurogenic disturbances; one of the chapters on the neuroses is written by a psychoanalyst, Franz Alexander. There is a chapter by Kantor on the commonly encountered functional disturbances of the colon and another by Hurst on the so-called mucous colitis.

It is pleasing to see that Dr. Portis has had the wisdom to include chapters on the gastrointestinal manifestations of cardiovascular disease, renal disease, anemia, arthritis, gout and abnormalities in the glands of internal secretion. Actually there are two chapters on the gastrointestinal syndrome associated with disease in the kidneys and bladder. These chapters should serve to remind would-be gastroenterologists that not every patient who complains of stomach trouble has disease in the digestive tract. There is a chapter on the allergic disturbances of digestion, and there is even one on the relation of the teeth to disease in the digestive tract. A discussion of alkalosis and its treatment is modern, and there is a chapter by Wangenstein in which he presents his theories as to the production of acute appendicitis. He believes disease in this organ is produced by an increase in the intraluminal pressure.

The book is well printed and well illustrated, and most of the chapters are well written. Dr. Portis and the publishers are to be congratulated on the completion of so excellent and comprehensive an undertaking.

Leprosy. By Sir Leonard Rogers, K.C.S.I., C.I.E., M.D., and Ernest Muir, C.I.E., M.D., F.R.C.S., Medical Secretary, British Empire Leprosy Relief Association. Second edition. Cloth. Price, \$4.50. Pp. 260, with 81 illustrations. Baltimore: William Wood & Company, 1940.

To a revision of the work of these two well known authorities much knowledge that has accumulated since the publication (1925) of the first edition is added. The preface states that the senior author is mainly responsible for approximately the first half of the book, which covers the history and distribution, epidemiology and communicability, and prophylaxis, while the junior author presents the etiology, clinical aspects and treatment of the disease. However, each author has had the benefit of his colleague's wide experience and extensive knowledge on the subject.

The book presents a vast amount of information on leprosy in a relatively short space. Furthermore, it is presented in a manner that makes it most interesting to lay as well as to medical readers. While it is apparent that the authors believe in the principles of segregation of leprosy patients they point out with laudable impartiality the advantages and disadvantages connected therewith. They also discuss practical measures for meeting problems connected with leprosy, instead of theoretically ideal procedures which have been found in practice to be fraught with uncertainty or failure. Many of the difficulties encountered in the management of leprosy in an individual as well as in a community are discussed frankly and openly.

The only criticism is that in the more technical part of the book the classification and nomenclature adopted by the International Leprosy Congress at Cairo (1938) is used, while in the other part the older nomenclature is employed. If the equivalent terms of each nomenclature could be set forth by means of a short statement presented in tabular form, it would

make less confusion in the minds of nonprofessional readers. Medical readers should have little if any difficulty in this respect.

In the chapter on diagnosis, detailed instructions for taking specimens for bacteriologic examination by both the "snip" and the "scraped incision" method are given. The latter method is easily applicable in the practice of any physician and its description here adds most valuable information to the book. There are four appendixes that give timely information to leprosy workers: (1) preparation of esters of fatty acids of chaulmoogra and other oils for treatment, (2) preparation and application of the lepromin (Mitsuda) test, (3) application of the iodide test, (4) report of the Subcommittee on Epidemiology adopted by the International Leprosy Congress, Cairo, in 1938.

There are ten charts and seventy photographic reproductions illustrating the text, and page references are used freely throughout the work.

The book is recommended for both lay and professional readers who wish to obtain authoritative information on leprosy, a subject that, in the past, has suffered greatly from misinformation, much of which has resulted from traditional beliefs that have been handed down through ages past. The statement that "the disease is probably less infective than tuberculosis" may be surprising to the average reader, but in the light of modern scientific knowledge it is wholly warranted by observed facts.

The book is printed on excellent paper and substantially bound in cloth.

Simplified Diabetic Manual With 163 International Recipes (American, Jewish, French, German, Italian, Armenian, etc.). By Abraham Rudy, M.D., Associate Physician and Chief of the Diabetic Clinic, Beth Israel Hospital, Boston. Introduction by Dr. Frederick M. Allen. Second edition. Cloth. Price, \$2. Pp. 216, with illustrations. New York: M. Barrows & Company, Incorporated, 1940.

The aim of this manual, according to the author, is to make the task of understanding diabetes easier for the patient as well as for all those entrusted with his instruction and welfare. The author feels that the manual not only should be a guide to the patient but should be of valuable help to the busy general practitioner, the dietitian and the nurse. Dr. Frederick M. Allen in his foreword congratulates the author on avoiding fads and reckless extremes of treatment. Many manuals have been written with this laudable intention of aiding physician, nurse and patient all at one time. But the fact always remains that manuals written primarily for the patient cannot be of much practical value to the physician in guiding his therapy and that manuals actually of value to the physician are too technical for the patient. Another reason, of course, why a manual must be chosen carefully, at least, is that the physician may disagree with the author's method of treatment and hence may be put in a doubtful light by the patient perusing the manual. In other words, the patient is placed in a position of "checking up" the physician's treatment with that recommended by the author.

The author confuses the reader by giving much space to detailed examination of the twenty-four hour urine, since he has this to say: "A sugar-free urine is not a sign that the diabetic condition is fully controlled. . . . To get the best results in the treatment of diabetes, we must keep the blood sugar as near to normal as possible." The author in attempting to guide the diabetic patient to cooperate better with the physician incorporates too scientific and too technical material possibly confusing to the patient and liable to distress him to the extent of abandoning further reading: Examples: ". . . one of the important symptoms in diabetes is glycosuria. . . . The test generally employed . . . is called the Benedict test." It is misleading to say "It is . . . important that no person should be declared a diabetic only on the basis of a positive Benedict test in the urine. Usually the patient has or had some symptoms characteristic of diabetes. . . ." True, all persons with a positive Benedict test should be diagnosed as diabetic until further tests or examinations are undertaken by the physician. But it is not true that the patient generally has had previous apparent symptoms. Many diabetic patients have been accidentally discovered in the course of an insurance examination, without any history of diabetic symptoms. There is much discussion of vitamins, diabetes and pregnancy, complications in diabetes, and

deficiency states, all of which, although too technical for the lay reader, is incomplete for the so-called busy physician.

The section on diets is undoubtedly the most valuable part of the manual. The author introduces Jewish, Italian, French, Armenian, German and other national dishes which have the great value of diversifying the rather monotonous diet of most diabetic patients. The amounts permitted are extremely small, but to a gourmet they will be a godsend anyhow. The author avoids fads and reckless extremes of treatment. This conservatism should give the volume a broad field of usefulness among those doctors who agree with the author's ideas of treatment and who are willing to put into the hands of their more literate and intelligent patients a guide that will supplement his oral instructions to them.

Précis d'hygiène. Par Jules Courmont, professeur d'hygiène à la Faculté de médecine de Lyon. Avec la collaboration des Pr Ch. Lesieur et Dr A. Rochaix. Fifth edition revised by A. Rochaix, professeur d'hygiène à Faculté de médecine de Lyon. Boards. Price, \$3.20. Pp. 1,001, with 212 illustrations. Paris: Masson & Cie, 1940.

This edition constitutes a comprehensive revision of the manual. It reflects well the efforts of Professor Rochaix to bring the text of previous editions abreast of recent developments in hygiene, preventive medicine and sanitation. Various aspects of these subjects are presented clearly, concisely and usually in sufficient detail. In making this revision, Rochaix has adhered to the original intention of Courmont in writing a book primarily for the use of advanced medical undergraduates. The improvements and revisions in public health administration introduced into France following the World War are discussed. In this connection demography, sanitary organization and personal, environmental, industrial, social and mental hygiene, epidemiology and prophylaxis of communicable diseases are presented in considerable detail. Among new chapters added are ones on epidemic infectious jaundice, the Rickettsias, the control and prevention of rheumatism, mental disease and prophylaxis, and eugenics. The illustrations appear to be adequate. Those of sanitary appliances reflect design and type applicable especially to France. A comprehensive, specific bibliography is lacking, which detracts considerably from its use by English students of hygiene.

Bone Graft Surgery in Disease, Injury and Deformity. By Fred H. Albee, M.D., LL.D., Sc.D., President, International College of Surgeons. Assisted by Alexander Kushner, M.D., B.Sc. Cloth. Price, \$7.50. Pp. 403, with 297 illustrations. New York & London: D. Appleton-Century Company, Inc., 1940.

This is an excellent book on the technic of bone graft surgery in disease, injury and deformity. It does not lend itself well to a critical review because much of its content deals with detailed discussions of technic. The methods advised by Dr. Albee are ingenious and well described. Nevertheless, they are often intricate and the surgeon who has only a superficial training in bone surgery may well find himself in difficulty when attempting some of the cabinetmaker methods sometimes recommended by Dr. Albee. However, this is no real reason for criticism of the publication. The following quotation from the author's preface pretty well outlines the scope of the book:

It is now over twenty-five years since I set myself to the task of writing the first book published in any language upon the sole subject of bone graft surgery. Since that time, the trustworthiness of such work has been amply proven. Bone graft operations were than relatively new but have since been adopted by the surgical profession the world over, much to the benefit of the patient.

In the present volume there are incorporated those procedures which have stood the test of time, namely those which I have used myself and those which I have not elected to use myself but have included because of their employment by experienced surgeons of mature judgment.

There are some procedures with which many orthopedic surgeons will not agree, such as the resection of malignant bone tumors and immediate restoration of the involved portion of the skeleton by transplanted bone. Being a pioneer, Dr. Albee is more interested in demonstrating that a certain procedure can be carried out than he is in quoting statistics to prove its practicability. There is much sound teaching scattered through the text, as when Dr. Albee draws attention to limitations of tendon transplantation for residual paralysis from infantile paralysis and devotes considerable time to discussing the more reliable stabilization operations on the skeleton. The book is divided into chapters on the general principles of bone

grafting, armamentarium of the orthopedic surgeon, spine fusion, bone graft surgery of ununited fractures, bone graft surgery for replacement of bone, plastic bone graft surgery, arthrodesing bone graft operations and bone block operations. The book is well illustrated, and the index of both authors and subjects is adequate. Any surgeon doing bone graft surgery should not be without this volume; it is a worthy attempt by Dr. Albee to place his experiences in the hands of the profession.

Control of Pain in Dental Practice: A Symposium conducted by the Academy of Stomatology, Philadelphia. Edited under the direction of J. L. T. Appleton, D.D.S., School of Dentistry, University of Pennsylvania, Philadelphia. Cloth. Price, \$3. Pp. 195, with 16 illustrations. Philadelphia, Montreal & London: J. B. Lippincott Company, 1940.

In this symposium on pain the participants represented the fields of anatomy, histology, physiology, psychology and psychiatry, pharmacology, materia medica and operative dentistry. It is in no sense a textbook on anesthesia or pain but is definitely worth reading by those anxious to attain great proficiency in the art of control of pain and by those interested in this subject. It deals with local more than with general anesthesia and is appropriately divided into eight chapters on the basis of the grouping suggested. As stated in the introduction: "the chapters . . . contain much new material, concisely and simply presented"; and especially designed for the "general practitioner of dentistry—his needs, his wants and his interests." But little fault can be found with the subject matter; perhaps it is too concise and too brief. With respect to buffered anesthetic solutions, it seems likely that the clinician discussing their use has never employed them and that his unfavorable opinion of their efficiency is dependent on lack of experience.

Diseases Affecting the Vulva. By Elizabeth Hunt, B.A., M.D., Ch.B. Cloth. Price, \$4. Pp. 215, with 54 illustrations. St. Louis: C. V. Mosby Company, 1940.

This book was written by a dermatologist and not by a gynecologist, as might be expected from the title. There is evidence throughout the book of the author's vast experience with vulval conditions, which the preface states is based on more than 1,000 cases. The book contains thirty-two chapters and completely covers all vulval conditions. The classification of diseases is based as far as possible on etiology. There are separate chapters for lichen planus, leukoplakia and kraurosis vulvae, although there is still controversy concerning the differences among these three conditions. Many dermatologists and gynecologists consider leukoplakic vulvitis and kraurosis vulvae as the same disease. British opinion, however, is in favor of the belief that these are distinct diseases. All the chapters are short but compact and complete. In each one is a fairly extensive section on treatment. The last chapter in the book is devoted entirely to the subject of treatment, and in it is included a discussion of all forms of therapy which may be employed to combat vulval diseases. There is a small but thorough chapter on pruritus, which includes an excellent classification depending on the diverse pathologic conditions responsible for this condition. The book is well written and illustrated. There are eighteen magnificent colored photographic plates which greatly enhance its value. Every dermatologist and gynecologist should possess a copy of the book.

Laboratory Text in Pharmacology. By Robert P. Walton, Professor of Pharmacology, School of Medicine, University of Mississippi, University. Paper. Price, \$1.50. Pp. 85. Philadelphia, Montreal & London: J. B. Lippincott Company, 1940.

This brochure is of interest to students and teachers in experimental pharmacology. The exercises outlined are concisely stated and of sufficient number to demonstrate the fundamental facts concerning the mechanism of drug action. A few of the exercises are gargantuan; for example, to demonstrate the action of carbon monoxide, the author uses an automobile and with a garden hose conducts the gas into a box where the dog is incarcerated. Such an experiment well demonstrates some automobile adventures, but most laboratory workers would find a much simpler method of demonstrating the action of carbon monoxide or of illuminating gases. The student who sees the exercises listed in this book demonstrated or who performs them himself has adequate opportunity to become well grounded in the fundamentals of pharmacology.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

CHRONIC RESPIRATORY DISEASE AND VINCENT'S INFECTION

To the Editor:—A white woman aged 40, previously in excellent health, recently suffered a mild attack of influenza. Following this she developed a moderately severe sore throat, an annoying slightly productive cough and an acute laryngitis and tracheobronchitis. The laryngeal and tracheal symptoms responded readily to treatment, but mild bronchial symptoms persisted for about two weeks. Sputum analyses were done showing the predominating organisms to be Vincent's spirochetes and short chain streptococci. Smears and culture from the mouth, gums and pharynx were negative for spirochetes, but smears and cultures from the thick, gloiry sputum were positive for Vincent's organisms. Positive results were obtained for several days, when sputum production ceased. There were also a few eosinophils in the sputum. Her leukocyte count throughout showed a range of from 5,000 to 8,000 cells with 60 per cent neutrophils and an eosinophilia of from 10 to 20 per cent. A history of Strongyloides infestation two years previously was obtained. Investigation showed that this was successfully treated at that time. A series of stools were examined for ova and parasites, with negative results. There was no history of undercooked pork. Since her return from the hospital two weeks ago the low grade fever has persisted, and she has had an annoying dry cough, which seems to be initiated by a tickling in her throat. A tuberculin test has been done which was strongly positive, but stereoneurogenograms of the chest show no evidence of pulmonary disease. The sinuses are perfectly clear, agglutination tests and serologic tests are negative. She is improving gradually and feels well except for easy fatigue and the cough. I would like information on treatment of pulmonary Vincent's infection, whether arsenicals and other heavy metals are used with success, and, if so, what preparations and dosage. Is eosinophilia usual with this type of infection as in bronchial asthma? What is the prognosis in pulmonary Vincent's infection, and does this type ever clear up spontaneously? With gradual improvement and no sputum, is expectant treatment justified? I would appreciate any references to the literature available.

M.D., California.

ANSWER:—The history of the patient as given seems to be characteristic of the mild form of infection of the respiratory tract prevalent during the past few years. There was apparently an attack of influenza or an influenza-like infection, accompanied or followed by laryngitis and tracheobronchitis with the persistence of symptoms of bronchitis. The leukocytes were normal in number and the sputum was small in amount. In many such cases symptoms persist sometimes for several weeks with fatigue and cough. The presence in the sputum of bacteria, which are commonly found even in normal persons, usually has no significance. In the case in question a predominance of Vincent's spirochetes may mean nothing or may indicate that they are able to subsist on tissue injured by some other cause. The significance of eosinophilia is uncertain, but it may indicate a persistence of strongyloidosis.

Strongyloidosis may persist for twenty years or more, and in certain patients the larvae, like those of *Ascaris* worms, may pass through the lungs and give rise to an acute reaction of the tissue, sufficient perhaps to account for some of the symptoms mentioned in the query and which are often mistaken for influenza. Further search should be made to find the larvae in the stool and in the sputum, if any.

"The intravenous injection of arsenicals or the intramuscular administration of bismuth preparations as spirocheticides is of little value and in fact unjustified in any regimen of treatment for Vincent's infection" (Shirazy, E.: Fusospirochetosis [Vincent's Disease], *Internat. Clin.* 2:115, 1940). "As a matter of fact, Vincent's infection has occurred among luetics undergoing heavy arsenical treatment" (Farrell, G. W., and McNichols, W. A.: Efficacy of Various Medicaments in the Treatment of Vincent's Stomatitis, *THE JOURNAL*, Feb. 20, 1937, p. 630).

Since Vincent's infection of the lung seems to depend chiefly, if not entirely, on some preceding disease of the lung which permits its existence, the prognosis depends chiefly on the progress or regress of the primary condition. If the primary condition heals, Vincent's infection will most likely clear up spontaneously. Expectant treatment would seem to be indicated for the patient in question, but search should be continued for its cause if the symptoms and signs persist. Attempts to improve the general health are important.

POSSIBLE CAUSE OF DEATH OF YOUNG MAN DURING SLEEP

To the Editor:—I should appreciate any suggestion as to the cause of death of a man aged 22 who was in previous good health although not robust, with no evidence of heart or lung trouble. He went to bed as usual and was found dead the next morning. The rest of the family heard nothing unusual from an adjoining room. He often slept on his abdomen and this is the position in which he was found, with not over 2 to 3 ounces of blood having run out of his nostril. The limbs were neatly arranged. The anterior part of the face and chest were blue from pooling of blood in the capillaries. There was nothing to suggest suicide.

M.D., Indiana.

ANSWER:—In view of the limited information submitted, only speculative suggestions can be offered to explain the death described. The need of a thorough postmortem examination is strikingly obvious. Excluding all forms of poisoning and immediate violence, the question is what natural conditions might cause the apparently peaceful death in sleep of a man aged 22 without any known indications of disease. Of the more or less latent conditions that might cause rapid death even in young persons are coronary disease; rupture of the heart from, say, gumma in the myocardium; interference with the cardiac conduction systems by fatty or fibrous changes or by hemorrhage, as illustrated by the sudden death under anesthesia of a girl aged 19 years from hemorrhage into the auriculoventricular region; pulmonary embolism from, say, the deep veins in the calf of a leg; massive internal hemorrhage from an unrecognized tuberculous focus in the lungs, from a gastric ulcer or possibly an esophageal varix; intracranial hemorrhage from rupture of an aneurysm of a cerebral vessel or from a "silent" glioma; subdural hemorrhage from a relatively slight, perhaps even overlooked, trauma; sudden pressure effects of a so far "silent" brain tumor. In view of the fact that the victim went to bed "as usual," it seems reasonable to exclude an acute infectious process as the cause of death. It is to be noted, however, that certain forms of acute myocarditis, of acute bulbar encephalitis, of acute pharyngitis with edema of the glottis, and of septicemia may run an extremely rapid fatal course. But what about the statement that "not over 2 to 3 ounces of blood had run out of the nose"? Was this pure blood or a bloody fluid? If the latter it could have been the result of pulmonary congestion and edema coupled with the postural settling of the blood in the vessels of the face and nasopharyngeal lining, but if it is granted that it was pure blood then the cause of the bleeding requires consideration. The blood may have come from hemorrhage, as mentioned, in the digestive or respiratory tract, but it is also possible that it resulted from an incidental, simple nose-bleed, whatever the cause of death may have been. Finally, sudden or rapid death may take place in an epileptic convulsion, particularly in the case of young persons with the so-called lymphatic constitution. In the case under consideration, however, the apparent absence of bleeding from the mouth (from biting the tongue) and the "neat" arrangement of the limbs do not support the possibility of an epileptic death.

VAN DEN BERGH REACTION FOR JAUNDICE—BLOOD PROTHROMBIN ESTIMATION—HEPATIC FUNCTION TESTS PRECEDING OPERATION

To the Editor:—Is the van den Bergh reaction valuable in differentiating jaundice of obstructive character from jaundice from acute hepatitis? How is blood prothrombin estimated. What is the normal level? What essential laboratory tests do you consider necessary as routine in all cases in which gallbladder or duct surgery is anticipated? Is blood cholesterol estimation of value?

M.D., Washington.

ANSWER:—The van den Bergh reaction is direct (that is, a color develops immediately on the addition of Ehrlich's diazo reagent to blood serum) in both hepatogenous jaundice and that produced by extrahepatic biliary obstruction. In the former type of case the direct reaction may develop rather slowly (the so-called delayed direct reaction), but the distinction is not often sharp enough to be clinically useful.

A quantitative determination of prothrombin in blood plasma may be made by the two stage method of Warner, Brinkhous and Smith (A Quantitative Study on Blood Clotting: Prothrombin Fluctuations Under Experimental Conditions, *Am. J. Physiol.* 114:667 [Feb.] 1936). The normal is reckoned as 100 per cent, and results in the plasma under investigation are given in percentages of the normal. A simpler method which is much more generally used is that of Quick, Stanley-Brown and Bancroft (A Study of the Coagulation Defect in Hemophilia and in Jaundice, *Am. J. M. Sc.* 190:501 [Oct.] 1935); it consists in the determination of the clotting time of plasma to which has been added an optimal quantity of calcium and a fixed amount of thromboplastic substance prepared from rabbit brain emulsion.

Normal plasma clots under these circumstances in about twenty seconds; in the presence of prothrombin deficiency the clotting time may be greatly prolonged. By making serial dilutions of the plasma to be tested, one can obtain a good quantitative estimation of the degree of deficiency (Kark, Robert, and Lozner, E. L.: Nutritional Deficiency of Vitamin K in Man: A Study of Four Nonjaundiced Patients with Dietary Deficiency, *Lancet* 2:1162 [Dec. 2] 1939). A simple bedside method based on the same principles as Quick's procedure is that of Ziffren, Owen, Hoffman and Smith (Control of Vitamin K Therapy: Compensatory Mechanisms at Low Prothrombin Levels, *Proc. Soc. Exper. Biol. & Med.* 40:595 [April] 1939); it is also reported in percentages of normal. All the methods, especially the first mentioned, present technical problems, and the original articles should be consulted for details.

There are actually no specific tests for hepatic function which need to be performed routinely on all patients to be subjected to surgical operation on the gallbladder or bile ducts. For persons who are not jaundiced at the time of examination, only such laboratory studies as clinical judgment would dictate in the individual case are necessary; if the patient previously has had repeated episodes of biliary obstruction and obstructive biliary cirrhosis is suspected, a bromsulphalein test may be recommended as an index of the operative risk. For visibly jaundiced patients it is customary to determine the level of serum bilirubin and the prothrombin clotting time; if the former is more than 10 mg. per hundred cubic centimeters it may be wise to perform a hippuric acid test of hepatic function and, if the amounts eliminated are reduced to 50 per cent of normal or less, the risk of operation may be assumed to be increased (Quick, A. J.: The Synthesis of Hippuric Acid: A New Test of Liver Function, *Ann. J. M. Sc.* 185:630 [May] 1933). If the prothrombin clotting time is prolonged, therapy with vitamin K or one of its synthetic analogues is indicated. The combination of measurable hepatic damage (as determined by the hippuric acid test) and prothrombin deficiency requires special preoperative and postoperative care. In such cases a determination of blood cholesterol and cholesterol esters may give useful information. Normally, biliary obstruction produces a considerable elevation of both substances; if investigation reveals material reduction of cholesterol and esters in the presence of jaundice, a considerable degree of damage to the parenchyma of the liver may be assumed. The appraisal of probable hepatic damage induced by obstruction to biliary flow is a complex and difficult matter, and some of the numerous recent articles on preoperative and postoperative care of jaundiced patients should be consulted for further details.

VENOUS THROMBOSIS AFTER TYPHUS

To the Editor:—I recently treated a man for typhus fever of rather typical course except that after the patient's general improvement he had a severe pruritus of the chest, abdomen, back and upper extremities. This finally cleared up. During the third week of his illness he began to notice some edema of the left ankle region. This receded when the extremity was elevated. However, when the patient was allowed out of bed the entire extremity quickly became swollen. He has now been out of bed for about two weeks. Swelling diminishes greatly each night, but within a few minutes after standing in the morning swelling becomes evident from the toes to the groin. Physical therapy has been of no value and he is now being supplied with a rubber stocking extending from the toes to the upper end of the thigh. How often does such a sequel appear in typhus fever and what treatment would you suggest?

M.D., Georgia.

ANSWER:—This description seems to fit a thrombosis of one of the larger veins of the leg. Thrombosis of the smaller vessels is an almost constant feature of typhus and, while thrombosis of the larger vessels is not so common, it is by no means unknown.

In this case it would appear that one of the larger leg veins was the site of a thrombophlebitic process. From the description it is impossible to say whether it is the femoral or one of the iliac veins.

As far as management is concerned, the first requirement is to make sure that the active phlebitic process has subsided. A smoldering activity may persist for weeks, and there is danger that a fragment may get into the circulation and produce a pulmonary embolism. If this dangerous accident does not occur, there is the possibility of progression upward of the inflammatory process. If the phlebitis and thrombosis extend into the vena cava, the circulation in the other leg will be impeded.

It is often difficult to be sure that a phlebitis has become quiescent. The temperature should be carefully watched, and the slightest degree of fever should be considered evidence of activity. Any tenderness about the vein should be sought for.

Rectal examination might be helpful. The erythrocyte sedimentation rate should approximate normal before activity can be ruled out. A leukocytosis should be regarded with suspicion.

If activity can be ruled out it is likely that the present management of supporting the circulation with an elastic stocking is the best one. Any surgical intervention should be carefully weighed and at best is a highly technical procedure. Any manipulation should be avoided.

BROWN DISCHARGE PRECEDING MENSTRUAL FLOW

To the Editor:—Several of my patients, subsequent to treatment of the cervix and uterine canal with the actual cautery, have had an annoying brown discharge from the cervix, which precedes menstruation for from two to five days. In none of the cases has there been a stenosis of the canal nor does further dilation of the canal improve the condition. The uterus and adnexa have appeared normal in outline and position. Is this a common occurrence? Have you an explanation for it or any suggestion as to treatment.

M.D., Alabama.

ANSWER:—The occurrence of a brown discharge from the cervix for one or more days before the actual menstrual flow begins is not uncommon. The discharge is the result of mild bleeding, which usually has its origin in the cervical canal but may arise within the uterine cavity. It usually occurs without the intervention of cautery treatment. In fact, in some cases it ceases after the electric cautery is applied to the cervix. The exact etiology of the brown discharge is unknown, but in some cases mild inflammation of the cervix is responsible, and in others cervical polyps are the source. In many cases the discharge ceases spontaneously after a few months.

ERYTHEMA OF FACE

To the Editor:—A woman aged 45, who has had several attacks of allergic dermatitis, has also a chronic complaint of ten years' duration that is new to me. This is a sharply defined erythema of the cheeks, chin and tip of the nose, associated with sensations of tingling and heat in those areas, occurring every night about 8 o'clock, and persisting for about an hour. It appears nightly regardless of diet, occupation or activity, whether the patient is at home or dining out or on a trip; no correlation with any external factor can be made. The patient does not use cosmetics. The condition has not been affected in any way by the menopause, which was three years ago. When the erythema is absent, the involved areas appear entirely normal except for a few dilated vessels on the alae nasi. I should appreciate any suggestions as to diagnosis and treatment.

Leonard Nelken, M.D., Clinton, Iowa.

ANSWER:—From the few facts given, one is impressed by the history of a sharply defined acute erythematous eruption "involving the cheeks, chin and tip of the nose" of short duration, and occurring each night. The statement "The patient does not use cosmetics" must be taken with reserve for any woman in this era. The fact that a "few dilated vessels of the alae nasi" are present when the erythema is absent suggests that the telangiectasia might be the residuum of a previous acne rosacea, which could well occur in a woman of 45 and make this area more vulnerable for the development of an external irritant dermatitis, e. g. from soap or cosmetics. Soap used by the patient in washing her face in the evening could well be the irritant, and the matter of soaps should be carefully gone into, with patch testing. The history of the use of cosmetics should be carefully rechecked, with patch testing of all her present cosmetics if the other suggestions given fail.

For a good general discussion of the role of soaps in the etiology of dermatitis, and methods for its prevention see article and discussion on Dermatitis of the Hands in Housewives, by James W. Jordon, Frank A. Dolce and Earl D. Osborne, *THE JOURNAL*, Sept. 21, 1940, page 1001.

ARTERIAL EMBOLISM FROM INTRAGLUTEAL INJECTION

To the Editor:—In *Queries and Minor Notes* of Feb. 22, 1941, there is described under the heading of "Pain and Echar After Intragluteal Injection" what apparently corresponds to typical instances of arterial embolism. This accident has been reported in the literature as following a variety of injected agents, chiefly oil-suspended bismuth salts but also water-soluble mercurials (Carley, P. S., and Morgan, A. G.: *Ven. Dis. Inform.* 17:281 [Oct.] 1936) and other medicaments such as "quicamphol" (Sulzberger, M. B., and Boer, R. L.: *Am. J. Syph., Gonorr. & Ven. Dis.* 24:50 [Jan.] 1940). The fact that no blood was aspirated, while severe pain and shock almost immediately supervened, does not exclude the likelihood of an intra-arterial injection but instead suggests that only the point of the needle entered the arterial wall, the force of the injected mass of solution then causing penetration into the lumen, followed by symptoms of embolism. Wise and Sulzberger estimated the frequency of this accident as once in every ten thousand intramuscular injections in spite of rigid adherence to the proper technic.

SELECTIVE SERVICE AND PSYCHI- ATRIC ISSUES

C. MACFIE CAMPBELL, M.D.
BOSTON

The late Colonel Salmon in the last war had to break the news to a divisional officer who was having a trying time that a psychiatrist was being attached to the division. The officer asked Dr. Salmon how one spelled psychiatrist and what sort of creature he was. He then broke out "H . . . , haven't I trouble enough already?" The end of the story was, however, that they lived happily ever after, or at least that the commanding officer came to appreciate the work of the psychiatrist.

The ordinary citizen, like the divisional officer, has a very hazy idea as to the nature of psychiatry and as to what the psychiatrist does or tries to do. The scope of the psychiatrist's work is not very clear to many of his medical colleagues. Etymology suggests that he has something to do with the mind; as the mind is imponderable and invisible the work of the psychiatrist seems more abstract than the work of those physicians who deal with what can be seen under a microscope, be poured into a test tube or throw shadows on a roentgenogram.

As a matter of fact, the psychiatrist does not deal with disembodied spirit; he deals with persons, with individual human beings, with people who are in some sort of trouble, who are either distressed themselves or causing distress to others by various complaints or by some change in their behavior or in their attitude toward life. The challenge to the psychiatrist, therefore, is something very concrete, a human being in trouble. The internist, faced with a patient, may abstract from the fulness of the concrete situation and concentrate on the behavior of the heart or another organ; the psychiatrist has to concern himself with the behavior and the welfare of the person as a whole.

The psychiatrist has to make the usual physical examination, for unusual behavior or ideas or emotions may be due to underlying bodily disease. A depressed or irritable condition may be due to an abscess at the root of a tooth; irrational behavior may be due to too little sugar in the blood. But even with sound teeth and ample supplies an individual may become depressed or abnormally jealous or see slights, hostility and accusations where none exist; he may be hampered by morbid fears or strange tricks of thought. He may commit misdemeanors. He may even have the greatest variety of bodily complaints while all the delicate methods of modern medicine fail to reveal any objective disorder.

These same delicate methods carry one only a certain distance in the study of the patient, for the patient is not merely a physiologic preparation, a complicated system of chemical and physiologic forces; he is a human individual endowed with instincts and emotions, molded by his past experiences and enmeshed in a complicated social and cultural environment.

With due attention to the complexities of human nature, the physician often solves problems of his patients which elude him as long as he considers the patient as merely an animal in an experimental laboratory.

This point of view applies to other fields than that of medicine; it applies to the whole field of human relations. It is of equal validity in time of peace and in time of war; it applies to the army as well as to civilian society. The specialist preoccupied with the technical aspects of his own field is apt to neglect the basic facts of human nature; as the physician sometimes neglects the patient while he studies the disease, so the teacher may see the pedagogic unit, not the child; the manufacturer may think in terms of the economic unit, not of the actual John Smith at his bench; the army officer, with his emphasis on discipline and technical training may not be aware of the complicated system of forces in the individual human being with the regimental number and the standard uniform.

Concentration on the study of nervous and mental disorders may seem to disqualify the psychiatrist from giving advice in regard to the varied difficulties which the ordinary person meets in the manifold situations of everyday life. There is a widespread tendency to look on those who have nervous or mental symptoms as being somewhat different in their essential organization from the so-called normal person. The normal person, however, is merely one whose inner difficulties are covered by the usual veneer of conventional behavior. It is only when this veneer is stripped off either through the disturbing effects of illness or through voluntary effort in the consulting room that the basic forces of human nature can be systematically studied. A nervous or mental upset simply reveals the workings of our common humanity. We have learned much from our nervous and mental patients, especially as to those factors in the human personality which are so commonly repressed and ignored but which still exert a powerful influence; facts as to the instinctive basis of our life and as to the profound influence of early experiences. So it has been customary to compare our mental life with the iceberg, the greater bulk of which is unseen beneath the surface; in both cases the submerged factors may be fraught with danger.

When the psychiatrist has studied the physical condition and the disturbed personality of a person he has still not completed his survey, and to complete it he has to go further afield. The patient does not exist as an isolated unit; he cannot be understood as such.

We are "every one members one of another." The individual lives in a community or a social group, and the cultural atmosphere is shot through with forces and values and beliefs. In his daily activity the individual is a member of one or more groups, loosely or strictly organized, each with its own code and beliefs and habits, traditions and loyalties. The satisfactions of the individual, his stability and his efficiency depend not only on his bodily condition and individual experiences but on his relationship with his fellows in these various groups.

The importance for the individual of the interpersonal forces within the group is seen in family life, in neighborhood gangs, in industry and in commerce, in the army at peace and in war, in religious, political, social and cultural associations. In emphasizing the importance of morale, of loyalty, of tradition and social solidarity we pay tribute to this factor in our community life.

These remarks give some idea of the attitude and procedure of the psychiatrist when dealing with the individual. His experience helps him to a certain extent to detect those persons who, on account of the instability or inadequacy or sensitivity of the personality, are specially vulnerable and unlikely to meet as well as their fellows the conditions of army life, whether during the period of training or in combatant service. On this account the Selective Service System makes its present demands on the psychiatrist. The present seminar with its various sessions has been organized in order that the task of the psychiatrist may be carried out as efficiently as possible. The discussions in the special sessions are largely of a technical nature dealing with the specific task of selecting for the army men as free as possible from any indications of personal instability or inadequacy. The practical significance of this task is clearly illustrated by General Pershing's cable from France in July 1918:

Prevalence of mental disorders in replacement troops recently received suggests urgent importance of intensive efforts in eliminating mentally unfit from organization's new draft prior to departure from the United States.

While the foregoing is the immediate and specific practical demand made on the psychiatrist by the Selective Service System, the information gathered by the system furnishes food for thought about our social organization in general. The data on other types of disability have also acted as a challenge. It is astonishing to find how often the condition of the teeth disqualifies the registrant. Are the resources of the community for safeguarding the teeth of young people inadequate, or if not why are the available resources not fully utilized? The rejection of registrants on account of nervous or mental instability or vulnerability raises similar but much more complex questions. Perhaps the latter may seem somewhat remote from the immediate practical task of the Selective Service System, but the more concrete and specific details of that task are being taken up in the other sessions. In a general session one may perhaps be permitted to present a few general impressions and considerations suggested by the Selective Service System.

The aim of the system is to furnish the army with the best material available; its primary interest is the efficiency of the army. When the registrants who are chosen are inducted into the army, the army accepts responsibility for them, gives them a systematic training and has an opportunity of studying further the

individual soldier. His new life involves separation from family, uncertainty about home affairs, close association with a large group of strangers, unfamiliar routine, strict discipline, automatic obedience and unaccustomed restriction of spontaneity and originality. There is also the anticipation of future dangers and horrors, of combatant activity which conflicts with the familiar civilian code. The soldier takes with him to camp his own personal preoccupations, private difficulties, undigested memories. In the army under the close inspection of noncommissioned officers, line officers and medical officers and in close contact with his fellows any mild deviation of mood or behavior or attitude is liable to be reported and psychiatric advice made available if necessary.

Thus a soldier, moody and inefficient, attracted the attention of an officer. An interview with the psychiatrist revealed that this man, working in camp as assistant to a kitchen worker, had been in civilian life a well paid salesman. He had accepted his allotted task in the army without overt protest, but his unconscious reaction had been a loss of alertness and initiative. A change of job transformed him rapidly into an energetic worker and promising soldier. Another soldier showed similar inefficiency and lack of attention and of interest, with vague nervous symptoms. He was a college graduate doing rather inappropriate work without complaint. When given a task more in keeping with his capacity he proved efficient and was soon promoted. The army is not a clinic and emphatically disclaims any desire to receive any patients under the guise of soldiers; nevertheless, it has the opportunity of dealing with many of the worries and difficulties of the soldiers and of helping them to a sound and sane view of their own problems.

At the same time that the soldier is becoming physically hardened and acquiring technical skill he is establishing a relationship with his fellows and with his officers which is of the greatest importance for the efficiency of the army. This relationship means that to a certain extent he loses his isolated individuality and becomes part of a group to whose emotions and behavior he tends to be extremely responsive, and from this identification with the group he derives support and courage. This relation to comrades and officers in the setting of a common enterprise is of the essence of morale. It means an efficient social solidarity, largely unconscious, not based explicitly on any particular formula or recognized mutual benefits.

Army morale and civilian morale are not two different problems, they are two aspects of the broad problem of national morale. Attention to the needs of the individual personality and to the development of group loyalty, so essential in the army, is of equal importance in the civilian community, in the home, the school, the factory and the neighborhood. While the Selective Service System tends to focus attention on the needs of the army it is well to keep in mind the intimate bonds between the army and civilian life. The peace of mind of the civilian depends on his confidence in the national defense; the efficiency of the army depends on the output of the factories, which reflects the social solidarity of the civilian workers.

The individual soldier is not altogether detached from the civilian life of the community; he is still responsive to the emotional values and opinions and behavior of his neighborhood, his family, his fellow workers, his social group, his church. He brings with him to camp attitudes and beliefs acquired in his home, at his job, in his social contacts. He expects to resume his place in

the community after the period of training in the army is over. The immediate setting of his life in the army does not exclusively determine his outlook, his measure of personal satisfaction and his feeling of social solidarity. Friction in the home, strikes and recriminations in industry, economic injustice, racial and religious conflicts, accusations and suspicions in the political arena—the echoes of these are wafted into the peaceful atmosphere of the camp and trouble the peace of mind of the recruit with uneasy doubts and suspicions.

Even in a time of national emergency, and in special consideration of this very emergency, it seems important to pay attention to the selectees of the second group, in other words to the civilian population, and to consider whether the same principles which apply to the selectees of the first group, i. e. those in the army, may not profitably be applied to the civilians. There seems to be all the more reason for emphasizing principles of sound individual and social health in view of the fact that their application is equally important in peace and war, in normal times and in times of emergency. They are the principles which do justice to the fundamental values of human life. If the army of selectees is expected to defend our way of life, it devolves on the community at large to do all that is possible to make that way of life worth defending.

In times of peace the inertia of many a community and its indifference to and neglect of mental hygiene are striking. The national emergency is a challenge; if the community is thereby awakened to its responsibility in the field of mental hygiene, if its emotions are stirred and its resolve quickened, then the national emergency may be as much of a boon in promoting the mental welfare as in improving the physique of the community.

For the selectee in the army there is a certain supervision of his total program as well as supervision of his specific vocational program. There is some recognition of the need of the individual selectee for self expression, intellectual pabulum, recreation and social contacts. It is realized that the peace of mind of the individual may be disturbed by the urge of the instincts, by inner tensions and conflicts, by disturbing preoccupations, by undigested memories. It is found useful to give the recruit and his supervisors some simple information about the human personality, about the instincts and the emotions, about repression and the varied manifestations of repressed factors. It is considered that with this information the soldier will be better able to face combat situations and less likely to misinterpret or exploit transitory symptoms. Through such instruction the soldier learns to face honestly the role played by fear in human nature, accepts its existence without shame and at the same time recognizes his responsibility for subordinating fear to loyalty to his unit.

To the selectee of the second group, that is, to the ordinary civilian in the community, male or female, child or adult, how can the same principles of mental hygiene be applied as to the selectee in the army? The national emergency is a challenge to those in civilian authority and to those of public spirit to show an effective interest in the needs of the ordinary individual for self expression and personal recognition, for school or adult education, for recreation and social contacts. The ordinary civilian, like the soldier, needs some simple knowledge of human nature in its personal aspects; he, too, is better able to conduct his life and to meet emergencies if he knows something of the role of the emotions and instincts and of the influence of repressed

factors on human conduct. In the interest of the soldier the conflict between the instinct of self preservation and the herd instinct, a conflict which is the fertile source of war neuroses, deserves frank discussion; in the interest of the civilian the conflict between the sexual instinct and loyalty to the ethical demands of the group, a conflict equally productive of peace neuroses, deserves the same frank treatment. In the army incipient signs of a troubled or a frustrated personality may be noted by alert noncommissioned officers, line officers or medical officers and receive early and appropriate treatment; in civilian life much human misery might be alleviated and human wastage prevented if there were the same alertness to the signs of human distress on the part of all those in positions of supervision or authority, whether in the home or in the school, in commerce or in industry, on the land or in the town, in production or in management, in education or in administration. If all such persons in supervisory positions were indoctrinated with some knowledge of the needs of the human personality and of the signs of its being in trouble, then the same early attention could be given to the personality disorders, the nervous and mental symptoms, of the civilian selectee as the army strives to give to the soldier selectee. For the dissemination of the relevant information one would enlist the cooperation of the medical practitioner (whether working in private practice, hospital, school or factory), the district nurse, the welfare worker, the teacher, the clergyman, the employer of labor.

In this program one should be able to count on the earnest cooperation of state and local departments of health, public welfare, education and mental hygiene as well as on the pioneering activity of voluntary organizations interested in these topics. The press and the radio are powerful instruments. When those who direct the community life are seriously interested in guaranteeing to the individual civilian safeguards and facilities for the welfare of his personality comparable to those offered the army selectee, it will be possible to begin a practical program of education and to organize the resources (clinical, recreational, educational and social) which the mental health of the community requires.

The army takes care of the well-being of the individual selectee and pays attention to those factors which make out of a mass of men an organic whole infused with one moving spirit (*esprit de corps*). It is equally important for the civilian authorities, while solicitous of the needs of the individual, to cherish jealously those forces which bind individuals into organic groups inspired by common purposes and ideals.

The family is the model of such an organic group. If one thinks of the human race living in friendly relations which bring profit to each group and do justice to the diverse needs of the various groups, we speak of a family of nations. If we wish to refer to any group, whether industrial or social, as being knit together by particularly intimate bonds, we are apt to compare it to a family. It is in the setting of the family that the human individual serves his apprenticeship in the art of social life. The experiences of the child within the family circle leave the deepest impression on the personality of the adult and are fraught with weal and woe for his individual destiny and for his value to the community.

The selectee in the army is still organically connected with the family group; his well-being and personal outlook influence the life of each member of the family group, while the atmosphere of the family, with its

special traditions, code, loyalties, affections, continues to have its influence on the peace of mind, the satisfaction and the stability of the selectee. The national emergency emphasizes the importance of the family for the development of the individual personality and of group loyalty, and the interaction between the individual selectee and the home from which he comes may have an important influence both on the morale of the soldier and on the morale of the family.

It seems a reasonable task to survey more systematically the situation, to learn a little more about the atmosphere and the special values in the homes of the community, to consider whether detrimental factors are prevalent and what resources are available for dealing with them.

Much effort is spent in giving parents elementary information about nutrition and infection; it is as important for the welfare of the children that parents know something about their personality needs. Man does not live by bread alone, and there are moral as well as bacterial infections; an unwholesome mental atmosphere may coexist with open windows.

In the small social system of the family the essential needs of the child are the same as those of the military selectee; they include affection, recognition, the right to self expression, a feeling of group membership and some grasp of a common purpose or code. The parent in the interest of the welfare of the child may learn to limit the "don'ts," so often the unintelligent frustration of natural trends. He may be encouraged to give the child the tools for developing the child's own skills and interests. He may give the child no occasion for unwholesome repression, utilizing the child's interest and questions for open and frank discussion. Helpful instruction of parents may prevent feelings of inferiority, guilt, resentment, frustration and insecurity laying down their roots in childhood.

Disharmony in the home, absence of tolerance and affection, undue repression of the child may make it difficult for that child when grown up to establish a proper relation to his fellows and a sound attitude toward the representatives of the established order. The adult difficulty may express itself in the factory as in the regiment, in the religious as in the political field. The individual may pride himself on his antagonism to authority or his preference for the radical and the heterodox as evidence of his adult emancipation, while these traits may really represent the persistence of a childhood attitude, an attitude appropriate to the early situation of the special home but perhaps quite inappropriate to the realities of the actual adult situation.

One need not think that a community program of parental education is an impractical suggestion. There are many avenues of approach to the family. The family is organically connected to the wider community in various ways, through occupational contacts, school contacts, nursing associations, settlements, boy scouts and girl guides, neighborhood activities of various types, quite apart from such sources of information as church, press, radio and film.

The state may have no comprehensive system for supervising the mental welfare of the individual adult or the hygienic conditions of the individual home, but each individual when of school age comes under the influence of a selective service system of considerable antiquity.

The recent selective service system established under the spur of national emergency insists that all men of a certain age shall register for a certain amount of

training in the interest of national defense. The school system has long insisted that all individuals of a certain age, male and female, shall register for a period of training in order to meet the responsibilities of peace. It is perhaps even more important that the community shall be prepared for peace than for war.

As the army in the training of its selectees does not concentrate exclusively on vocational training but realizes the importance of self knowledge, self expression, social recognition and group loyalty, so in the training of its selectees for peace the school system may do well to emphasize the same factors. The teacher must be willing to give the child honest information about the basic instinctive forces and to afford him or her the necessary material and opportunities for creative activity, and must help the child to establish his own place in the school community and to learn the significance of team work. The teacher should be at least as sensitive as a sergeant to moods and misdemeanors and is perhaps even better equipped to give supervision and counsel. The morale of the classroom and the playground may reinforce or correct that of the home, and the school period be a valuable preparation for the tasks of life. In the right school atmosphere a child will feel the kindly interest of the teacher and a friendly bond with schoolmates; he will feel free to express his own interests, subject to the restriction due to the equal rights of others; he will feel that he belongs to a group to which he owes loyalty, and he will neither use nor be exposed to terms which suggest racial, religious, social or economic inferiority. The schoolbooks which he uses will give an example of that fairness, open-mindedness and objectivity which are conditions of a wholesome mind and of sound community organization.

If the school is to live up to its opportunities teachers must have a training appropriate to their duties, for on the personality and the insight of the teachers depends the value of the school as a preparation for life. Leaders of the community, whether in official or unofficial positions, will therefore vigorously support any measures which promise a wiser selection and better training of teachers, as the army studies how best to select and train its officers.

When the individual has passed from the tutelage of the home and the school and takes up his independent economic activity, are there any special organizations which may have for the civilian selectee some of the solicitude which the army has for the military selectee? At once we are struck by the enormous opportunities for community service open to industrial organizations, already so efficiently utilized by some, a community service not measured in terms of production but in terms of human values. Emphasis by industry on human values has an influence which is not limited within the factory walls but ramifies widely into the community. Simple knowledge of health and procedures familiar to the worker in the factory are carried by him into the home. Similarly, a wholesome mental attitude in the factory may foster in the home an equally healthy atmosphere of frankness, friendly confidence and mutual consideration.

As neuroses, neglected in civilian garb, became a matter of national importance when clothed in khaki, so the health of factory workers in Great Britain, neglected in times of peace, became a matter of national concern when these same workers were employed in the production of munitions. The Industrial Health Research Board of 1930 received its original impetus from the study of the health of workers in munitions factories

in 1915. During the last few decades there has been a stirring of conscience in industry and a growing insight into the needs of the individual worker. It is fortunate that the welfare of the worker and the interests of production run parallel. Thus the psychologist at a plant had as his primary aim "to see that the workers leave the plant at night neither fatigued nor irritated nor nervous"; the executive had the psychologist there because, as he explained, "I find it pays." Another factory thought fit to allot to each new employee a sponsor as a college does to its freshmen, thus establishing from the beginning a wholesome personal relationship of the individual worker with the group. The importance of some attention to the personal needs of the human individual was ruefully recognized by one executive after an expensive strike due to the special ambition of one worker: "I suppose we ought to have fired him or to have promoted him." The neglect to give that man earlier the prestige or recognition he craved had been costly.

Much attention in the past has been given to questions of lighting, ventilation, noise, economy of movement in the individual task, to methods of payment and to the problems of fatigue and monotony. It is only recently that attention has been specially directed to the personal preoccupations of the individual worker, to his relationship with his fellow workers, to the importance of group fellowship both for the personal stability and for the efficiency of the worker. To be treated like a human being and not like a cog in a machine, to feel that one is an integral member of a social group with its own special role, to have the chance to unburden oneself to a sympathetic listener, whether the origin of the trouble is in the home or in the factory—these are conditions which satisfy some of the deepest needs of human nature. The results established by the prolonged research of the Western Electric Company have shown the great importance of these principles in industry, but it is difficult to overestimate their profound importance for social organization in general, both in peace and in war. The level of the national morale, both in the army and in the civilian population, will largely depend on the extent to which those principles are adequately grasped and efficiently applied. They are of the essence of social solidarity.

The foregoing discussion of civilian and army morale emphasizes respect for the individual personality and a due appreciation of the bonds which transform a number of separate persons into a living whole.

It devolves on civic leaders and on all public-spirited persons to see how far these same principles can be woven into the fabric of everyday life of the community, whether in peace or in war. The task of the individual worker should have some relation to his or her capacity and interest; recreational facilities should be adequate, social contacts fostered and intellectual and esthetic needs met. In a community which rejects regimentation and imposed uniformity, mutual understanding and tolerance are essential for the growth of social solidarity. Facts must be honestly faced and ventilated if a satisfactory solution of difficulties is to be found. There should be no blindness to the disagreeable, no wishful thinking; inequality and injustice must be admitted and racial, economic, social and religious differences squarely faced. Friendly cooperation will not be advanced by seeing only the weakness of others or by mutual recriminations. Slogans must be more than magic words. In the interest of the whole community the individual group

may be willing to subject itself to psychologic and social scrutiny corresponding to the individual psychologic analysis which so often brings in remarkable returns.

The same principles which are of value in regard to the individual, the family, the nation are relevant to the stability of international relations. Self knowledge, mutual understanding and tolerance are essential to wholesome and stable relations.

It is evident that in the establishment, the formulation, the dissemination and the application of the foregoing basic principles the medical profession has a unique responsibility and a unique opportunity for social service. To live up to its responsibility and to utilize its opportunity, it must accept fully the implications of the fact that health adequately conceived includes the health of the human personality.

MATERNAL MORTALITY IN NORTH DAKOTA

JOHN H. MOORE, M.D.

Chairman, North Dakota Committee on Maternal and Child Welfare
GRAND FORKS, N. D.

Editorial comment¹ on United States infant and maternal mortality rates in *THE JOURNAL* opened with this significant statement: "Maternal mortality rates of the United States have been reported and discussed for several years apparently to conjure conclusions designed to throw discredit on the medical profession." I agree with the Editor that such conclusions have been drawn. I submit the record made by North Dakota physicians to prove, for my state at least, that they are fallacious.

North Dakota held the enviable position of having the lowest maternal mortality rate in the United States for 1938, 2.4 per thousand live births. The provisional rate for 1939 is 2.3. In a report² to the North Dakota State Medical Association I stated: "The problem of maintaining this low rate or even of lowering it still further is our problem as private practitioners. I believe that the private physician in North Dakota is assuming the leadership in maternal care that is rightfully his and the response that the physicians of this state have given our Committee on Maternal and Child Welfare in its attempts to further your educational program is most heartening."

To date there have been three stages to the "educational program" since the maternal and child welfare committee was first appointed by the North Dakota State Medical Association in 1935. The first consisted of talks on obstetric subjects given by members of the committee before the component district medical societies of the North Dakota State Medical Association. These talks stressed the importance of the fatal triad infections, toxemia and hemorrhage. The second stage consisted of the presentation of lectures on obstetric and pediatric subjects by visiting clinicians at various centers throughout the state. In a representative year, 1939, one hundred and ninety-eight physicians registered for these courses in the ten cities in which they were given. The clinicians, selected by a subcommittee of the maternal and child welfare committee, were chosen because of their teaching ability and their familiarity with clinical

cal obstetrics and pediatrics, and in each instance the choice was a most happy one. The program is now in its third stage, which consists of postgraduate courses in obstetrics and pediatrics for North Dakota physicians at the Center for Continuation Study at the University of Minnesota. The last of these courses, given in

* Figures from the U. S. Bureau of the Census.

November 1940, brought the North Dakota registrations to sixty-three.

The financing of the second and third stages of the program has been from funds obtained from the Maternal and Child Hygiene Division of the United States Department of Labor through the North Dakota State Department of Health. The state health officer, Dr. Maysil M. Williams, was appointed secretary of the North Dakota Committee on Maternal and Child Welfare, and this committee, representing the North Dakota State Medical Association, accepted an invitation to become the Maternal and Child Health Advisory Committee to the North Dakota State Department of Health, with the result that the most harmonious relationship exists between organized medicine and the state health department in this important field of maternal and child welfare. The leadership of the private physician has not once been challenged or usurped by any official of the state health department. There has been a growing demand on the part of physicians for places in the courses offered at the University of Minnesota. Selection of the physicians to attend these courses is made through the district medical societies in any manner which these societies desire, and all sections of the state have been represented.

The leadership in the field of maternal and child welfare remains in the hands of the private physicians in North Dakota. Is that leadership adequate?

Maternal mortality rates should not be the only criteria by which one should judge the adequacy of maternal care; but they are the most dramatic and certainly the most easily available. The physicians of North Dakota are not satisfied with the present rates, low as they are. I have discussed this question with many of them, and it is their feeling that it is not impossible to visualize the time when not more than 1 woman in 1,000 will die as the result of pregnancy or labor. The leadership in the private practice of medicine is adequate to accomplish just that! Meanwhile let those who would challenge the leadership of organized medicine point to a better record to substantiate their claims. Table 1³ shows what has happened within the five year period

1935-1939 with regard to certain selected causes of maternal mortality.

In reviewing the histories of the patients who had fatal toxemias of pregnancy in 1938 and 1939, our historian reported that of the 13 who died in 1938 5 had had some form of major operative procedure to effect delivery from below and 1 had had a cesarean section, whereas among the 7 who died of toxemia in 1939 there was not 1 instance of accouchement forcé or cesarean section. The figures, to be sure, are small, but the trend toward conservatism is unmistakable.

Is the pregnant woman turning to other agencies for obstetric care in North Dakota or does she have faith in her private physician? An unprejudiced answer is found in the comparative data obtained by preschool conferences conducted by the North Dakota State Department of Health, as given in table 2.

The midwife has no official status in North Dakota. The term is used to include all of those, exclusive of licensed physicians, who conducted deliveries. It will be noted that the percentage of deliveries conducted by such persons was almost constant in the years sampled; likewise, that the percentage of labors conducted by physicians during the same years was, almost constant. Women in preschool conferences talk freely to the attendants, the public health nurses; therefore there can be no bias in the information obtained in the last line of table 2. If antepartum care is one of the criteria by which the efficacy of obstetric practice can be measured it would appear that the pregnant woman in North Dakota is not turning to other agencies for obstetric advice but is relying on her private physician to supply it. Forty-seven per cent of the women interviewed in 1929 made at least one visit to their physician during pregnancy; but of the 83 per cent who consulted their physician in 1939 54 per cent began their antepartum care in the first trimester and 30 per cent in the second trimester, and only 16 per cent waited until some time in the third trimester to consult him.

The pregnant woman in North Dakota has retained her faith in her private physician, and, especially among the younger pregnant women, antepartum care is being sought and given earlier in pregnancy.

Can the private physician be trusted with the problems of maternal welfare without recourse to the socialization of medical practice? This question is of great economic importance from the point of view both of the patient and the physician. In March 1940 a subcommittee of the North Dakota Maternal and Child Welfare

Committee, with Dr. Paul W. Freise, of Bismarck, as its chairman, undertook a study of the economics of obstetric practice in North Dakota. Four hundred and sixty questionnaires with explanatory letters were sent out to the physicians of the state, and one hundred and thirty-six replies were received. The answers of one hundred and eighteen physicians were complete and formed the basis of this survey. The complete report is worth the study of every one interested in the economics

3. This table was prepared by the Maternal and Child Hygiene Division of the North Dakota State Department of Health.

of medical practice, but the high lights of it which deal with the answer to the foregoing question are as follows:

1. The one hundred and eighteen physicians attended 5,505 private patients in childbirth in North Dakota from Jan. 1, 1939 through Dec. 31, 1939. Fifty and five-tenths per cent of these private patients paid in full for the services of their physician, and 18.7 per cent of them paid nothing. The remainder paid in part for the services rendered.

2. Eighty-eight physicians reported that they were paid for the obstetric care of 938 patients out of public funds.

3. The largest fee received by any one physician for attending a private patient at birth in a hospital was \$60 and the smallest \$20, and the average for ninety-five physicians reporting deliveries in hospitals was \$30.50. For deliveries in homes the largest fee received by any one physician was \$50 and the smallest \$15, and the average fee of one hundred and ten physicians for private patients delivered at home was \$28.

4. The largest fee received by any one physician from public funds for a delivery was \$32.50 and the smallest \$8.90; the average was \$16.05.

The private physician in North Dakota can be trusted with the problems of maternal welfare without recourse to the socialization of medical practice. He has met the challenge of diminishing financial returns by increasingly effective service to his maternity patients.

North Dakota is one of the most rural states in the nation. Of the original one hundred and thirty-six replies which Dr. Freise's committee received, only twenty-six came from cities of 10,000 or more population, seventeen from cities of 5,000 to 10,000 and ninety-three from the small towns or rural areas of the state. There are no exclusively maternity hospitals in the state, although the general hospitals are developing well organized and well equipped maternity departments in increasing numbers. The small maternity homes and community hospitals which grow up around the practices of many rural physicians are, for the most part, steadily improving the type of maternity care they render. But in the last analysis it is the individual care that the private physician is able to give his maternity patient that determines her safety.

COMMENT

Three questions dealing with the problem of maternal mortality in North Dakota have been answered. North Dakota physicians have maintained their leadership in the field of maternal care, and they have demonstrated that, in this rural state, they have increased the value of that leadership through the American way of private medical practice. The economic burden to the physician has often been heavy, but it has been carried without making the physician a government employee. The pregnant patient in North Dakota is seeking the advice of her private physician earlier in pregnancy, and she apparently feels that he can be trusted with the problems of maternal welfare without recourse to the socialization of medical practice.

CONCLUSIONS

1. North Dakota had the lowest maternal mortality rate in the United States for 1938, and the rate for 1939 is provisionally lower.

2. An educational program by and for physicians of North Dakota during the past five years has been jointly sponsored by the North Dakota State Medical Association and the North Dakota State Department of Health

along lines which have increased the prestige of the private physician and the confidence of the patient in him.

3. The significant decline in maternal mortality in North Dakota justifies the conclusion that private medical practice, by its insistence on the personal relationship which must exist between patient and physician, has made another valuable contribution to the safety of American democracy.

322 De Mers Avenue.

THE STRUCTURAL SIGNIFICANCE OF THE ILEOCECAL VALVE

E. G. WAKEFIELD, M.D.

AND

MORRIS T. FRIEDEL, M.D.

Fellow in Surgery, the Mayo Foundation
ROCHESTER, MINN.

A suction tube introduced into the duodenum usually relieves abdominal distention in cases of obstruction of the small intestine. Introduction of a suction tube into the duodenum may partially relieve the abdominal distention when the colon is obstructed. We have been interested in the variability of the relief produced by the use of suction tubes in cases of obstruction of the colon. In order to determine the cause of this variability we have studied the mechanism which separates the small intestine from the colon.

At the present time the most widely accepted opinion is that the cecum is separated from the small intestine by a sphincter muscle. An alternative, and the less popular, opinion is that the cecum is separated from the small intestine by a valve.

We have examined more than seventy-five specimens of the ileocecal portion of the intestine obtained at necropsy. The general size, shape and structure of each specimen were observed. After cleansing the lumen of the lower part of the ileum, cecum and ascending colon, we tested each specimen. Air and water passed from the ileum to the cecum without difficulty in all specimens. In about half of the specimens neither air nor water would pass in the reverse direction, that is, from the cecum to the small intestine. Pressures of 50 or 60 cm. of water could be obtained without leakage of water through to the small intestine if rupture of the cecum did not occur. In some of the specimens, water pressures of about 10 to 30 cm. could be obtained but with constant leakage.

As has been stated, all the specimens were obtained at necropsy and often had been stored in the ice box before examination. In such a specimen all possible nerve influences and sphincter effects can be disregarded. The sufficiency or insufficiency of the ileocecal valve then would seem to depend on its structure. Valves that were determined to be sufficient were dried and others were sectioned for study in order to determine the position and structure of their parts. There was a definite relation between the shape and development of the cecum and the sufficiency and structure of the valve. As shown in figure 1, a competent ileocecal valve consists of a superior and an inferior segment. These are fused to each other at each end and are continuous with the frenulum of the valve.

From the Division of Medicine the Mayo Clinic (Dr. Wakefield).

Read before the Section on Gastro-Enterology and Proctology at the Ninety-First Annual Session of the American Medical Association, New York, June 13, 1940.

When the cecum is distended the orifice is slitlike and lies with its long axis anteroposteriorly on the medial wall of the cecum. The frenulum, the superior and inferior segments and the slitlike orifice are demonstrable only if the cecum is examined in the distended state. If the cecum is opened and examined in the fresh state there appears a large papillary eminence with a rounded orifice on the medial wall of the cecum and the frenulum is hidden in the collapsed folds of the intestine. The specimens which proved to be insufficient on testing by passing air and water from the cecum into the small intestine all had one common feature, that is, they were shaped like the cecum of a fetus.

In the development of the cecum the valve frenulum first appears on the posterior side of the orifice of the ileum and later, as the cecum develops, the anterior portion of the frenulum appears. The frenulum is actually formed by a fold or invagination (much like a haustrum) on the wall of the cecum at the point where it joins the ileum. On the external surface of

Fig. 1.—Competent ileocecal valve in a distended and dried cecum.

the cecum this fold is represented by a deep crease on the cecal wall, which extends transversely from the ileocecal junction to beyond the anterior and posterior taeniae. The extent and depth of this crease is therefore a good criterion by which to estimate the completeness and extent of the frenulum. This crease is well defined only when the valve is competent. In a cecum which has a competent valve the base of the appendix lies at the level of and slightly posterior to the ileocecal junction. This shift of the true base of the cecum, which is represented in the fetus as the base of the appendix, is due almost entirely to the medial wall of the cecum becoming invaginated about the terminal portion of the ileum. It is this invagination which forms the valve and the frenulum. The invagination is most complete in a cecum containing a competent valve, because much of the medial wall of the cecum must be used in the formation of the valve and thus the base of the cecum is drawn upward and medially.

Deficiency of the frenulum is characteristic of the fetal ileocecal valve. Numerous fetal and infantile shaped cecums obtained at necropsy from adults have been tested by passing air and water from the cecum to the ileum. All have proved to be insufficient, and when opened and examined it was found that they had

poorly developed valves. The similarity of the ileocecal valves in these poorly developed specimens was striking (fig. 2). The absence of a frenulum or deficiency of one of its portions is always associated with an incompetent valve.

It was observed that the taeniae of the cecum lend considerable support to the frenulum of the ileocecal valve. The medial taenia plays an especially important role by stiffening the base of the valve.

The manner in which the competent valve functions is simple. As the cecum distends, the frenulum becomes increasingly prominent and taut and the circular orifice is drawn into a slitlike opening. The two valve segments are thus elevated and tightly approximated, and the orifice is effectively closed. If the medial taenia is torn near the ileocecal junction, a competent ileocecal valve is usually rendered incompetent. The competent ileocecal valve is very strong; it is stronger than any portion of the cecal wall.

CLINICAL CONSIDERATION

Roentgenologists can usually visualize the terminal portion of the ileum with a barium sulfate enema, but in about 10 per cent of cases it is impossible to visualize the ileum by this means. Manipulation with resulting distortion of the cecum is frequently relied on to force barium into the ileum.

In two cases in which high colonic stomas had been formed we were able to introduce large tubes into the ascending colon. Inflatable balloons were attached near the end of the tubes and inflation of the balloon through a second tube closed the lumen. The cecums were then distended with a thin mixture of barium and observed with the roentgenoscope. Pressures of 50 cm. of water were obtained in the cecum without demonstrating the incompetence of the valve (no manipulation was attempted). In one case, as soon as the barium entered the cecum a small amount was seen to escape into the terminal portion of the ileum, whence it was carried proximally by retrograde peristalsis. When the cecum became distended, no more barium could be seen to enter the terminal portion of the ileum. This pressure was maintained for from five to ten minutes without retrograde flow.

These observations illustrate that considerable pressure may be attained in the cecum following an obstruction of the large bowel. These pressures, when obtained, are probably considerably higher than the venous pressure in the colon. These pressures, if maintained, could readily lead to gangrene and perforation of the cecum.

The following case illustrates the ordinary sequence of events in perforation of the cecum:

CASE 1.—A woman aged 64, who registered at the Mayo Clinic in 1936, was found to have a tumor in the pelvis, and biopsy of a cervical lymph node disclosed a lymphosarcoma. She was seen at various times and roentgen therapy was administered. She returned to the clinic Jan. 18, 1939, complaining of weakness, dizziness and crampy pain across the abdomen. The pain had been present for three or four days. She had vomited once. Four weeks prior to this visit to the clinic the patient had become constipated, and two weeks later she had noted diarrhea with blood and mucus in the frequent small stools. One week prior to her registration she had had a rectal hemorrhage. Obstipation had been present since then. Catharsis and enemas did not produce any relief. She was decidedly emaciated when examined. The abdomen was considerably distended and tender; muscle rigidity was present in both lower quadrants of the abdomen. An irregular huge fixed mass filled the entire pelvis. Treatment with saline laxatives and enemas relieved

the obstruction. Roentgen therapy was again employed. On January 29 the patient was hospitalized because of increasing weakness, abdominal pain and distention. Obstipation again had developed. Some relief was obtained by the use of nasal suction and conservative medical treatment. On February 5 the abdominal pain increased and was now referred to the epigastrium. The patient died in a state of shock.

Necropsy disclosed gas and fecal material in the peritoneal cavity. There was little or no distention of the small intestine. The cecum was greatly dilated and hypertrophied; it was 10 cm. in diameter. Its base was turned upward and was near the gall-bladder. The entire base was gangrenous, and a perforation was found at this site. The remainder of the colon was greatly dilated, and an obstructing carcinoma was found in the rectosigmoid. Microscopic examination revealed thinning and inflammation of the intestinal wall at the site of the perforation.

The use of intestinal suction tubes in cases of obstruction of the colon must be considered in the light of the competent mechanical ileocecal valve. The introduction of a long intestinal tube for decompression of the large bowel can be successful only if the tube is inserted beyond the ileocecal valve. Introduction as far as the terminal portion of the ileum will offer no chance of decompressing the colon if the ileocecal valve is competent. This is just as true if only duodenal suction is employed.

The following case illustrates the effect of duodenal suction in successfully decompressing the small bowel without decompressing the colon:

CASE 2.—A man aged 75, who came to the clinic June 13, 1939, had suffered from constipation for two weeks previously. At first this had been relieved by enemas, but, for the last few days before the patient came to the clinic, enemas and other measures had not produced any relief. For four days before his registration the patient had vomited black vomitus. The Wangenstein method of intestinal suction had been employed. When the patient was examined at the clinic he appeared to be acutely ill. The abdomen was greatly distended and tympanitic. There was a fecal odor to the breath. Peristalsis was visible over the abdomen. Rales were audible in the right lung. Duodenal suction, intravenous administration of fluids, application of stupes and the use of enemas produced only slight relief. The next day the patient experienced a sudden severe attack of pain in the epigastrium. Peristalsis was not audible and the patient died in a state of shock in three hours. At necropsy gas and feces were present in the peritoneal cavity. The coils of small bowel were only moderately distended but the entire colon was greatly distended. A perforation was found on the anterior surface of the cecum. A carcinoma was obstructing the lumen of the rectosigmoid.

The use of a long intestinal suction tube for treatment of colonic obstruction is fraught with considerable danger. The tube must enter the cecum to decompress the colon effectively, and the presence of solid material in this portion of the bowel will quickly clog the tube. If the tube remains in the ileum, effective decompression of the cecum may not be obtained.

CASE 3.—A woman aged 55, who registered at the clinic July 19, 1939, had begun to have attacks of acute cramping pain in the lower part of the abdomen in May 1939. The attacks usually had occurred about an hour before meals and had lasted about two hours. She had had two attacks on successive days and morphine had been required for relief. She had been nauseated and had had mild pain for about a week. In July 1939 she had had a repetition of the previous attack with abdominal distention. Enemas had produced only slight relief. On examination the abdomen was found to be considerably distended. Proctoscopic examination revealed nothing abnormal. A roentgenogram of the abdomen made on July 23 revealed considerable gas in the large and small bowel. Distention increased and the Miller-Abbott tube was inserted July 23. It was demonstrated to be

in the midportion of the ileum the next day. Slight drainage was obtained by the tube. On the afternoon of July 24 the patient's condition rapidly became worse and an emergency cecostomy was performed. It was noted that although the colon was greatly distended there was practically no distention of the small bowel. The patient died shortly afterward. At necropsy free fluid and fecal matter were found in the peritoneal cavity. The cecum was edematous and there were five perforations in the midanterior wall. There was an obstructing carcinoma in the midportion of the sigmoid.

In this case adequate decompression of the small bowel was obtained with the long intestinal tube. Nevertheless the cecum remained distended. It lost its viability, and perforation occurred before cecostomy was performed.

It is possible for the small bowel to be distended even though the obstruction is in the colon and the ileocecal valve is competent. The distention occurs because of secondary obstruction at the site of the ileocecal valve. The pressure in the cecum becomes so great that the ileum is not sufficiently powerful to force its contents

Fig. 2.—Cecum and ileocecal valve of an adult and of an infant. In both of these valves the anterior frenulum is lacking. This accounts for the incompetence of the valves.

into the cecum. The distention of the small bowel thus occurs secondarily to that in the large bowel. Intubation and decompression of the distended small intestine will produce great relief for a time without relieving the dangerous distention of the cecum and colon.

The introduction of the suction tube into the small intestine may decrease the possibility of relieving obstruction of the colon by the administration of saline laxatives. Even if the tube is "clamped off" at intervals, when the suction is again applied the saline laxative and the intestinal fluid attracted by the laxative will be removed. In cases in which distention has progressed to the point where intermittent ileus exists, intestinal suction should be employed for a few hours to decompress the small bowel if the condition of the patient is good. This will protect the small bowel from the effects of venous stasis, permit a more rational surgical approach and allow the establishment of a colonic stoma below the cecum. It is in such cases that careful observation and judgment must be employed. The great relief experienced by the patient because of the decompression of the small intestine must not be allowed to mask a dangerously distended cecum. Often,

however, the employment of suction concomitant with and following surgical decompression will quickly restore the intestine to a functional state. Enterostomy or direct decompression of the bowel at any point proximal to the ileocecal valve may not decompress the colon even though the small bowel is adequately decompressed.

CASE 4.—A man aged 46, who registered at the clinic June 12, 1939, had had a severe attack of vomiting in December 1938 and had fainted. He also had noted severe distress after eating; this had been associated with nausea and epigastric pain. He had lost 35 pounds (16 Kg.). On examination he was found to be greatly emaciated and anemic. Roentgenoscopy disclosed gas in the colon and small bowel and some residue of barium in the colon from a barium sulfate meal which had been given previously. A roentgenogram of the abdomen made on June 15 revealed considerable gas in the large and small bowel. Intubation was not successful and exploratory laparotomy was undertaken. As soon as the abdomen was opened a large distended loop of ileum prolapsed into the wound and enterostomy was performed at this site. The patient felt well for a short time, but twenty-four hours after operation he was seized with severe cramping abdominal pain and chills. He failed rapidly and died about sixty hours after operation. Necropsy revealed a large carcinoma of the stomach which had invaded the mesocolon and obstructed the colon at its splenic flexure. The colon proximal to this site was greatly distended to the ileocecal valve. The small bowel was not unduly distended. The cecum had perforated at the site of a large ulcer. There were several smaller ulcers on the cecal wall.

Occasionally so much damage to the bowel wall has occurred that surgical decompression may be too late to relieve the pressure and restore the intestinal wall to a viable state:

CASE 5.—A woman aged 66, who registered at the clinic April 11, 1939, for the past three months had constipation which had alternated with diarrhea. For two months she had noted bright red blood in her stools. During the past five days she had become gradually more constipated and had had increasing abdominal distention with cramping abdominal pain and vomiting. The day prior to her registration she had had severe, sharp pain in the right lower abdominal quadrant with extreme tenderness and rigidity. The patient was emaciated, and the abdomen was tense and distended. There was a bulging mass in the right lower quadrant (cecum) which was very tender. A large fungating mass could be felt in the anterior wall of the rectum. Cecostomy was performed shortly after her admission and brownish fluid was noted in the peritoneal cavity. The patient died about forty hours after operation in a state of collapse with obvious peritonitis.

At necropsy fecal fluid was found in the peritoneal cavity. The cecum was distended and was gangrenous to a large extent. There was a perforation on the anterior wall. A carcinoma was found obstructing the sigmoid.

If the cecum becomes too greatly distended, it may rupture when the abdomen is opened. The following case illustrates this fact:

CASE 6.—A man aged 62, who registered at the clinic July 8, 1938, had noted a change in his bowel habit for the past year. Defecation had become more frequent and the stools had been soft and small. There had also been bloating and intermittent colicky pain. Enemas and passage of gas had produced relief. For the last three weeks prior to his registration he had felt much worse, and during the last week obstipation had been present. He had had nausea and vomiting for two days. Barium sulfate had been administered elsewhere. On examination the abdomen was found to be distended and tympanitic. Very little peristalsis was heard. A mass was felt high in the rectal fossa. Proctoscopic examination disclosed a carcinoma obstructing the rectosigmoid. A roentgenogram of the abdomen, made July 11, revealed distention of the colon. A duodenal tube was inserted and was at the third portion of the duodenum July 13.

The condition of the patient continued to become worse and the abdominal distention increased. Cecostomy was performed July 15. As the abdomen was opened a whistling noise was heard and gas escaped into the incision. A gangrenous perforation was observed in the cecum. The patient recovered satisfactorily and later underwent resection of the rectosigmoid for the carcinoma.

SUMMARY

The ileum and the colon in man are often separated by a one-way mechanical valve when the cecum is distended. The competent valve has a constant structure. Varying degrees of incompetence are associated with regular demonstrable structural differences of the valve. These structural differences are the result of variations in development. In cases of obstruction of the colon the intestinal suction tube should be used cautiously. The relief obtained by decompression of the small bowel in cases of colonic obstruction must not be allowed to mask a dangerously distended cecum. Surgical intervention is indicated when conservative medical measures fail to decompress the obstructed colon.

ABSTRACT OF DISCUSSION

DR. ERNEST H. GAITHER, Baltimore: The unique method of studies instituted by these investigators will prove helpful in bringing about a better understanding of the mechanism which has to do with the production of symptoms in obstructive lesions of the small and large intestine. They furnish an explanation of the functioning of an incompetent valve on a thoroughly established and skilfully worked out basis which is original. These authors prove the close relationship of the anatomic formation they have described to intestinal processes and subsequent symptoms. They point out that severe pressure may be attained in the cecum following an obstruction of the large bowel, thus causing a closed loop, and, if this pressure is maintained, gangrene and perforation of the cecum may ensue. They assert that the introduction of a long intestinal tube for decompression of the large bowel can be successful only if the tube is inserted beyond the ileocecal valve. We are warned that the use of a long intestinal suction tube for treatment of colonic obstruction is fraught with danger, because the tube must enter the cecum to decompress the colon effectively, and the presence of solid material in this portion of the bowel will quickly clog the tube. They emphasize the important clinical fact that it is possible for the small bowel to be distended even though the obstruction is in the colon and the ileocecal valve is competent, and that the distention occurs because of secondary obstruction at the site of the ileocecal valve. The pressure in the cecum becomes so great that the ileum is not sufficiently powerful to force its contents into the cecum. The distention of the small bowel thus occurs secondarily to that in the large bowel. Intubation and decompression of the distended small intestine will produce great relief only for a time, without relieving the dangerous distention of the cecum and colon. We are warned that the relief experienced by the patient because of the decompression of the small intestine must not be allowed to mask a dangerously distended cecum. The authors sound a most timely warning when they insist that surgical intervention is indicated when conservative medical measures fail to decompress the obstructed colon. The clinical histories presented prove the difficulty of anticipating and diagnosing correctly the actual disease entity and its site in cases in which carcinomatous growth of the intestinal tract is ultimately proved.

DR. JACOB M. RAVID, New York: The work of Drs. Wakefield and Friedell is of fundamental importance. For a number of years I have been interested in the problem of perforation of the intestine, and especially the colon, which is due not to any intrinsic lesion within the intestine at the site of perforation but as a result of distention caused secondarily by an obstructive lesion situated distally. This type of perforation, which was first described and correctly interpreted by Heschl

in 1880, has escaped the attention of most of the American observers. It is to be called a "distention" or "diastatic" perforation, which is meant to imply that the perforation may take place in an otherwise more or less normal intestine and is the result mainly of mechanical factors. It is in this respect that the work of Drs. Wakefield and Friedell is so interesting. For, whether the cecum or any segment distal to it will perforate or not, in the presence of an obstructive lesion distal to it, depends on the competence or incompetence of the ileocecal valve. If this valve is competent, the chances of a non-relieved distention and perforation of the cecum are great, while, if it is incompetent, the intestinal contents will regurgitate through it and thus perforation will less likely take place. I should like to ask the authors whether they have any statistical studies with regard to the competence or incompetence of the ileocecal valve. As far as I could gather from the literature, in only about 10 per cent is the ileocecal valve incompetent.

DR. E. G. WAKEFIELD, Rochester, Minn.: I have nothing further to add except to answer the question that, until we have studied a lot more specimens than we have, I don't think we should give any figures as to the number of competent and incompetent valves. We can say from what we have seen that approximately 50 per cent have been competent.

TREATMENT OF AMYOTROPHIC LATERAL SCLEROSIS WITH VITAMIN E (ALPHA-TOCOPHEROL)

PETER G. DENKER, M.D.

Associate Visiting Neuropsychiatrist, Bellevue Hospital
AND

LEONARD SCHEINMAN, M.D.

Resident Neurologist, Bellevue Hospital
NEW YORK

Following the pioneer work of Evans and Burr,¹ who demonstrated that both male and female rats ceased to grow on diets deficient in vitamin E, many reports appeared in the subsequent ten years confirming these investigators' findings in various animals and clarifying the pathologic basis of the paralysis noted. Pappenheimer and Goettsch² produced paralysis, ataxia and tremors in growing chicks, ducks and rabbits following diets deficient in vitamin E, and Blumberg³ likewise was able to obtain retardation of growth in young rats at the twelfth to the fourteenth week, with complete cessation at from eighteen to twenty-two weeks; the aforementioned conditions were completely corrected when vitamin E, in the form of wheat germ oil, was added to the diet. Interest in the effects of vitamin E was further increased when Ringsted⁴ produced paresis in more mature rats on a diet deficient in vitamin E which did not occur in animals who received a similar diet with the addition of wheat germ oil. Burr, Brown and Moseley⁵ obtained

similar results in mature rats but could not cure the resulting paralysis of the rats' hind limbs by the addition of large doses of vitamin E. Various other investigators⁶ corroborated the foregoing experimental observations. The paralyzes were thought to be in the nature of either muscular dystrophy or encephalomalacia until Einarson and Ringsted⁷ were able to show that lesions developed in the posterior columns and anterior horn cells of the spinal cords of mature rats kept on a diet deficient in vitamin E. Since, as they pointed out, the pyramidal tract in the rat is situated in the dorsal and not the lateral column of the spinal cord, as it is in man, Einarson and Ringsted suggested a possible relationship between the experimental results that they were able to produce and the clinical syndrome in man recognized as amyotrophic lateral sclerosis.

Clinically, the theories as to a possible etiologic relationship between a vitamin E deficiency in the diet and amyotrophic lateral sclerosis in man were first put to the test independently by Bicknell⁸ and Wechsler.⁹ Though Bicknell was primarily interested in the beneficial effect of vitamin E on the muscular dystrophies of children, obtaining favorable results in 12 of 13 cases, he also had the opportunity of treating 4 patients with amyotrophic lateral sclerosis with this vitamin. He felt that the condition of 2 of his 4 patients was arrested by this therapy, although the other 2 patients, in whom the condition was more advanced, showed no improvement and died. Wechsler,⁹ using alpha-tocopherol (the potent factor of vitamin E, synthetically produced), obtained a remission in 1 case of early amyotrophic lateral sclerosis and improvement in a case of more advanced sclerosis, noting that in the latter case the atrophy and fibrillations of the patient's tongue had disappeared and her general strength increased. In both the foregoing series of cases, vitamin E was administered orally. Wechsler, however, commented in his article that because of possible poor absorbability in the gastrointestinal tract it would be advisable to administer this vitamin parenterally in a future series. Lastly, Spies and Vilter¹⁰ observed that synthetic alpha-tocopherol has a beneficial effect on an occasional patient with amyotrophic lateral sclerosis.

In view of this solid experimental background and the encouraging clinical reports of Bicknell, Wechsler and Spies, we thought it advisable to test the therapeutic efficiency of vitamin E in a larger series of cases, by oral as well as by the parenteral use of alpha-tocopherol.¹¹

INVESTIGATION

Eleven patients with amyotrophic lateral sclerosis were carefully observed in the neurologic wards at Bellevue Hospital and our diagnosis was corroborated by at least two of the members of the staff. Most of the patients were admitted to the wards of the service so that more accurate control and observation could be maintained. All, except one who died in three weeks, were treated for at least one month with vitamin E, no other medication being given except a routine high vitamin diet customarily served in the hospital. The vitamin E was administered to the majority of patients

in the series were observed to become progressively worse in their illness while under treatment despite large doses of vitamin E. One of these patients in particular, showing minimal symptoms at the onset of treatment and receiving one of the largest total amounts of vitamin E in the series (over 7,000 mg. of alpha-tocopherol), gradually became more and more paralyzed while under observation for a three months period. Whereas on admission she was able to walk comfortably about the ward, when discharged she was in a practically bedridden state. The remaining 7 patients showed no objective or subjective improvement whatever at

Treatment of Amyotrophic Lateral Sclerosis with Alpha-Tocopherol

Case	Age	Sex	Duration of Illness	Symptoms	Duration of Treatment, Days	Total Amount of Alpha-Tocopherol Administered, Mg.	Results	Comment
1	47	♀	7 yrs.	Spastic paraplegia bilateral Babinski reflex; atrophy of hands; fibrillations; hyperactive deep reflexes; atrophy of tongue; dysarthria	31	3,880	No subjective or objective improvement	
2	57	♂	3 yrs.	Atrophy and fibrillations of tongue and arms; hyperactive deep reflexes; spastic legs; bilateral Babinski reflex	31	3,802	No improvement	Subjective improvement at onset, later denied; no subjective or objective improvement when treatment was discontinued or replaced by placebo
3	36	♂	2 yrs.	Same as in case 2	35	2,788	No improvement; death from broncho-pneumonia	Continued downhill course while under treatment, with ultimate death
4	41	♂	2 yrs.	Same as in case 2	51	5,362	No improvement	Subjective improvement at onset; patient encouraged to walk; later claimed no improvement, none noted objectively
5	43	♂	4½ yrs.	Atrophy and fibrillation of left shoulder girdle; hyperactive deep reflexes; no sensory changes; equivocal plantar reflexes; legs weak	30	4,420	No improvement	No subjective or objective improvement at any time
6	50	♀	1 yr.	Weak right arm, with atrophy of right hand; fibrillations of shoulder girdle; hyperactive deep reflexes; sensation normal	86	7,374	No improvement	Progressively worse while under treatment; minimal changes at onset, but on discharge both legs also involved and tongue atrophic; extension of lesion not checked by treatment
7	64	♂	6 mos.	Weakness of left hand with atrophy and hyperreflexia; fibrillations; legs normal; sensation normal	50	2,734	No improvement objectively or subjectively	A minimal case; patient not helped by treatment
8	64	♂	9 mos.	Same as in case 2	21	2,096	No improvement; death from broncho-pneumonia	Progressive downhill course despite treatment; resulted in death
9	41	♂	3½ yrs.	Same as in case 2	91	9,680	No improvement subjectively or objectively	Condition has been stationary for past year
10	59	♂	1½ yrs.	Atrophy and fibrillations of tongue; increased deep reflexes in arms, with atrophy; right Babinski reflex	52	6,280	No improvement	Subjective improvement at start; not sustained; bulbar signs seen to increase while patient was under treatment
11	54	♂	8 mos.	Atrophy of intrinsic hand muscles; fibrillations of shoulders; all deep reflexes very active; no Babinski reflex; sensation normal	27	4,910	No subjective or objective improvement	A vegetarian; always ate much green vegetables, fruit juices, cereals, milk, egg-nogs

both orally and by intramuscular injection, so that a total of approximately 100 mg. of alpha-tocopherol was given daily to each patient. At no time were any toxic manifestations observed. Complete details as to dosage, duration of illness, symptoms and results are outlined in the accompanying table.

RESULTS AND COMMENT

Despite the fact that the quantities of alpha-tocopherol administered were larger than the customary amounts considered adequate, we were not able to obtain even one case of striking improvement. Two of the 11 patients, both presenting bulbar signs on admission, continued their downhill course and died, the first of these after five weeks of vitamin E therapy, the second after approximately three months of treatment with large amounts of alpha-tocopherol. Two other patients

the end of the therapeutic regimen, although subjectively some of them, after the first week or ten days of therapy, stated that they felt somewhat stronger than hitherto. This observation, however, could not be corroborated objectively; nor was the subjective improvement maintained when a longer period of treatment had elapsed. It was our feeling that this early subjective improvement was to a certain extent psychologic, secondary to the more restful hospital environment with better nursing care. At the time of discharge, however, even the patients themselves could notice no improvement in their condition. On one or two occasions we attempted to use a placebo instead of the vitamin E, with no essential change in the therapeutic result.

In our series of 11 patients there were 9 men and 2 women, their ages ranging between 36 and 64. Both

early as well as more advanced amyotrophic lateral sclerosis were represented in the series, and we could not notice any difference in the therapeutic efficiency of vitamin E in either stage of severity.

Despite the fact that the majority of our patients were of the economic group one usually sees in a public hospital of this type, we could elicit no definite history of dietary deficiency. Most of them had been receiving adequate, well balanced diets of about the same quality and quantity as that of our other patients in the ward suffering from various other neurologic conditions. No gastrointestinal symptoms were present; nor were there any prolonged periods of diarrhea in the patients' histories. Roentgen ray studies of the gastrointestinal tract of a few of the patients were made but showed no pathologic conditions. Gastric analysis of some of the patients similarly showed normal conditions. It is interesting to note that a few of the patients had previously been treated with vitamin B₁ (thiamine hydrochloride) without striking results. Incidentally, one of the patients was a confirmed vegetarian who for many years had subsisted on fruit juices, cereals, milk, egg-nogs, lettuce and nuts—a diet unusually rich in all the vitamins—with no evidence at any time of gastrointestinal symptoms. Yet he fell victim to amyotrophic lateral sclerosis notwithstanding.

It has been suggested by Wechsler⁹ that possibly a multiple vitamin deficiency might be the cause of this illness, and in his treatment of some of his patients he used various other vitamins as well as the alpha-tocopherol. With this thought in mind, a further study is in progress with the purpose of deciding the value of vitamin B₆, as well as other components of the vitamin B complex which in certain other neurologic conditions have shown some promise of therapeutic value.

SUMMARY AND CONCLUSIONS

1. Eleven patients with amyotrophic lateral sclerosis were treated with vitamin E (alpha-tocopherol) in large doses given both by oral and by parenteral means.
2. No therapeutic results of any value were observed; 2 patients with more advanced sclerosis continued to fail, eventually dying. Two other patients were observed to become progressively more paralyzed while under treatment, despite large doses of alpha-tocopherol. The remaining 7 patients showed no improvement.
3. No toxic manifestations were observed.
4. It is our feeling that alpha-tocopherol is without value in the treatment of amyotrophic lateral sclerosis.

ADDENDUM

Since this article was written we have had 4 additional patients with amyotrophic lateral sclerosis, who have been treated with even larger doses of vitamin E than the other patients. These latter 4 patients were given an average of 250 mg. of alpha-tocopherol daily and, in addition, 100 mg. of vitamin B₆. Unfortunately, our therapeutic results were no more impressive than with the original eleven cases described.

Also, since the article was submitted, there has been a report by Drs. C. H. Shelden, H. R. Butt and H. W. Woltman¹² of their experiences at the Mayo Clinic with vitamin E therapy in amyotrophic lateral sclerosis, and it is interesting to note that they similarly obtained no therapeutic benefit from this drug in 6 cases.

140 East Fifty-Fourth Street.

VITAMIN E AND VITAMIN B₆

CLINICAL EXPERIENCE IN THE TREATMENT OF MUSCULAR DYSTROPHY AND AMYOTROPHIC LATERAL SCLEROSIS

JOSEPH W. FERREBEE, M.D.

WALTER O. KLINGMAN, M.D.

AND

ANGUS M. FRANTZ, M.D.

NEW YORK

Recent experiments on animals¹ have suggested the possibility that muscular dystrophy and amyotrophic lateral sclerosis might be deficiency diseases. In some clinics therapeutic trials with vitamin E preparations and vitamin B₆ (pyridoxine hydrochloride) appear to have justified this conclusion.² Because the problem of the etiology and treatment of these disorders is one of considerable importance and because it is complicated by the absence of a clear demonstration that a deficiency of either vitamin E or vitamin B₆ exists in these conditions, we are presenting our observations, which have failed to indicate that added amounts of these vitamins are of benefit to patients with muscular dystrophy or amyotrophic lateral sclerosis. Similar results as far as vitamin E (synthetic tocopherol) is concerned have recently been reported by Shelden, Butt and Woltman.³

MATERIAL

With two exceptions the subjects of this study were patients at either the Neurological Institute or its outpatient department in the Vanderbilt Clinic. Two or more examiners concurred in determining their diagnoses and in estimating the effect of treatment. The group as a whole was followed in the outpatient department, where they were seen at frequent intervals and where they were given intramuscular injections of *dl*-alpha tocopherol dissolved in oil. The treatment of patients C. and T. was administered privately at home and the course of the illness was reported by one of our associates.

The instructions to the patients were in general as follows: 2 tablespoons of wheat germ cereal a day; 1 tablet containing 10 mg. of *dl*-alpha tocopherol acetate three times a day; 1 to 2 capsules of Tocopherex each

This investigation was supported in part by a grant from the Carnegie Corporation.

From the Departments of Medicine and Neurology, Columbia University College of Physicians and Surgeons, and the Presbyterian Hospital and Neurological Institute.

containing the equivalent of 40 mg. of *dl*-alpha tocopherol twice a day; 10 to 30 mg. of pyridoxine hydrochloride dissolved in water once a day, and 100 to 200 mg. of *dl*-alpha tocopherol in sterile oil injected intramuscularly once or twice a week.⁴

RESULTS

The experiment is summarized in the accompanying table. Vitamin E and vitamin B₆ preparations as administered to our patients did not influence the course of either amyotrophic lateral sclerosis or muscular dystrophy. While under treatment, patients with amyotrophic lateral sclerosis became weaker and had increased difficulty in walking, talking and using their hands. The progression of symptoms did not appear retarded or accelerated as compared with the progression in patients who in past years did not receive this treatment.

COMMENT

It is difficult to reconcile the disparity which exists between our discouraging observations and the favorable results of therapy with preparations of vitamin E and vitamin B₆ reported by other workers. The explanation does not appear to lie in a difference in the amount of vitamin used or in the type of patient studied. Our patients, in general, received more of the vitamins and received them for a longer period than did other patients in whom improvement has been reported to follow therapy with these vitamins.

It does not seem likely that the disease processes in all our patients were at an end stage at which, because of irreversible pathologic changes, no improvement was to be expected. This certainly was not the fact with several patients in whom there was an active progression of symptoms despite treatment. Moreover, in

Summary of Experiments with Preparations of Vitamin E and B₆

Patient	Age, Years	Sex	Diagnosis	Duration of Disease, Years	Duration of Treatment, Months	Amount of Treatment					Progress

* Not obvious to examiners.
† Considered atypical amyotrophic lateral sclerosis by one observer.

The majority of patients with muscular dystrophy experienced no change in their condition. A few became worse, as might have been expected in a group of this size followed over a period of this duration. In none was there obvious improvement. The creatinuria and creatine tolerances of patients W. T. and William T. were not demonstrably influenced by the intramuscular and oral administration of approximately 10 Gm. of *dl*-alpha tocopherol in a period of ten days. Only 1 patient said he was better. This patient (V. S.) reported a slight improvement similar to that which he had reported prior to treatment with vitamins and not of an order of magnitude sufficient to be appreciated by the examiners.

patients V. S., J. D., W. T., William T., S. B. and J. B., biopsy and roentgenograms of soft tissue failed to reveal significant irreversible pathologic changes in the grossly hypertrophied gastrocnemius muscle. It is not unreasonable to expect that under proper treatment such muscles would have shown considerable improvement in function. However, neither examiner nor patient was able to detect improvement.

Since we have no idea to what our discouraging experience should be assigned, we are reporting our observations so that by their contrast with the successful experiments of others they may indicate the variations which are evidently to be expected in this confusing field of vitamin therapy.

SUMMARY

Vitamin E and vitamin B₆ preparations, given in large amounts, failed to influence the course of either amyotrophic lateral sclerosis or muscular dystrophy in a series of patients followed for a period of two to twelve months.

620 West One Hundred and Sixty-Eighth Street.

4. The wheat germ used was obtained from several sources: Mead Johnson & Co., General Mills and Dr. H. H. Bunzell. Ephynal, in tablets containing 10 mg. of *dl*-alpha tocopherol acetate, was furnished by Roche Organon Co.; *dl*-alpha tocopherol in sterile solution for intramuscular injection was furnished by Merck & Co., Inc.; purified and concentrated wheat germ oil in the form of Tocopherex was furnished by E. R. Squibb & Sons; pyridoxine hydrochloride in both tablets and crystals was furnished by Merck & Co., Inc. Through the cooperation of Dr. A. M. Pappenheimer and Marianne Goettsch, Ph.D., of the Department of Pathology and the Department of Biochemistry of Columbia University College of Physicians and Surgeons, the potency of some of the vitamin E preparations was verified by experiments on animals.

MEDICAL ASPECTS OF THE UNEMPLOYABLE CLIENT FOR RELIEF

CHARLES V. CRASTER, M.D., D.P.H.

AND

AARON H. HASKIN, M.D.

Health Officer and Medical Receiving Officer, Respectively,
Department of Health

NEWARK, N. J.

Relief authorities have often been accused of hardness of heart when it has come to granting relief to those applicants who have claimed some physical disability as the basis for inability to carry on ordinary employment. Human nature is prone to exaggerate physical aches and pains, so that relief authorities have sometimes been compelled to disregard even the family physician's certificate of disability in the face of a history of malingering and deceit on the part of the applicant.

Whether or not an applicant for relief is truly disabled could of course be determined only by an examination carefully and scientifically carried out by a disinterested physician or group of physicians. The whole matter of the proper disposition of persons claiming disability has been an administrative headache. The reason for this has been that relief officials have lacked any tribunal of a medical type before which clients of this kind could be examined and have their claims fairly adjusted.

The nonmedical interviewer has had to rely on the report of the family physician, who generally has had no opportunity to look into the extent of disability or check up by laboratory or other tests the claims of the patient of a partial or complete disability. The natural effort of every applicant for relief is, of course, to obtain as much relief as possible with the minimum amount of work given in return. In this respect it is perhaps a natural mental attitude on the part of the greater number of those seeking relief to maintain that they are entitled to relief under any circumstances by reason of their having paid taxes throughout their working lives.

It is this attitude on the part of the relief client that makes somewhat difficult the selection of suitable employment without putting undue hardship on the physical defects of age and disease. The employable person, of course, presents few problems, although from his class come numerous claims of partial inability to do certain kinds of work because of physical handicaps or inability to understand or become acquainted with work other than that followed by the applicant. This group, small in number, automatically becomes an addition to the problem of unemployment.

CLASSIFICATION OF UNEMPLOYABLE PERSONS

When one looks at unemployable persons as a group one will find that they fall into two classes, (a) those who are psychologically unemployable and (b) those unemployable because of physical defects. In the first-mentioned group are included persons who from birth have been more or less dependent either on the charity of relatives or on some form of public or private relief for their maintenance. This dependence, which under ordinary circumstances ceases when the person reaches adult life, is continued into mature age by those psychologically unemployable and remains as a support which is never voluntarily given up.

It is this failure to adjust themselves to the realities of life that prevents such persons from looking for a job or from holding one if they happen to get one.

Psychiatrists are prone to diagnose such conditions as neuroses and to declare those who have them unemployable. These are the passengers of modern life, and during times of depression they increase in number considerably to augment further the psychologically unemployable group. These people will remain unemployable until pressure is brought to bear to make them see the realities of life, in which each person must do his share of work toward the common good.

These people cannot think for themselves and must be given a type of work in which they are more or less perpetually under supervision and, indeed, are the kind of which totalitarian states will eventually be composed. There are, of course, occupations in which the individual is completely provided for, such as the army and navy, but in these the rate of intelligence is higher than in most other occupations. However, the only hope of making useful members of society of unemployable persons of the type described would require the development of work projects along the lines of institutional care. Such projects might put 90 per cent of these psychologically unemployable persons to work. There is, however, a small group of about 10 per cent who border on the psychotic and would for this reason be permanently unemployable. For these, institutional care must be provided. It is not meant that the person with a true psychosis should be included in this group.

THOSE UNEMPLOYABLE BECAUSE OF PHYSICAL DEFECTS

It is in the second group, the persons who claim unemployability because of a physical or disease problem, that there would seem to be a real chance for rehabilitation. It was presumed that in the majority of cases there existed a physical disability despite which, under intelligent and directed medical care, the person might be returned to the employable class.

If found after medical examination to be permanently unemployable, then the person could be referred to other agencies capable of dealing with those suffering total incapacity. By other agencies was meant the State Board of Children's Guardians for parents with dependent children, the State Commission for the Blind and the various state agencies caring for aberrant persons and those with permanent mental impairment. These would include feeble-minded persons and persons with epilepsy.

ATTEMPTED SOLUTION OF THE PROBLEM

In the early months of 1940 the number of unemployable persons on the relief rolls of the city of Newark was becoming so large a proportion of the total clients on relief as to suggest the definite need for a medical examination of all such persons. At the request of the director of relief of the city, a rehabilitation board was set up in the relief offices, with a staff of physicians assigned from the city dispensary.

A preliminary survey was first undertaken of all patients claiming disability as a basis for failure to work. The physical setup of the board required that one of the subrelief stations be divided into two sections: (1) a division for direct relief, consisting of a supervisor, case workers and other personnel of the department of relief, and (2) a medical division, supervised by a director and clinic physicians with nurses and an office staff.

By special arrangement the petitions of all those claiming physical disability throughout the city were cleared through this special suboffice. This meant that

all the records pertaining to any one case were available for the information of the medical division.

Once a week a general staff meeting was held which was attended by the case workers as well as by the medical staff. Each case in which disability was proved or disproved was carefully explained to the case workers by the medical staff. It was found that these meetings clarified considerably the outlook on the case and gave the case worker definite information of value as to the attitude to be taken. This was particularly valuable when partial disability was admitted and suitable work had to be found which the disabled person could perform without hardship.

PROCEDURE OF THE REHABILITATION CLINIC

The total number of unemployable persons to be checked numbered more than 3,600 out of a total of 16,000 on the relief rolls. The work of the medical board began with that class of unemployable persons who presented the quickest and greatest opportunity for rehabilitation, as shown by the original survey, those temporarily unemployable.

out any differences of opinion that an agreement on diagnosis could be reached and treatment could be carried out satisfactorily.

The worker engaged in following the case initiated a new system by which recommendations for rehabilitation were constantly brought to the attention of the patient and which thereby aided recovery.

RESULTS OBTAINED

During the four months operation of the rehabilitation clinic, the following results were obtained: Two thousand four hundred and forty-eight examinations were made. The number of patients declared temporarily unemployable was 807, of those declared permanently unemployable 658, and of those declared employable 980.

MEDICAL CONDITIONS FOUND

The accompanying table outlines the main causes of disability by grouped diseases among 1,535 persons found unemployable.

There were 563 men and 972 women examined.

Causes of Disability of Unemployable Persons

Appointments for examination were made on special forms, so that no more than thirty appointments were made for each day's examination. This enabled the examining physician to make a thorough check on the disability claimed.

The appointments were spaced throughout the day from 9 a. m. to 4 p. m., three physicians and a medical supervisor being present at all times. Copies of the forms for physical examination, together with all the information about the case known to the welfare department, were submitted with each case. When the patient was bedridden, the examination was made at the home. The medical examination was complete in every detail, in absolute privacy and, in the case of female clients, in the presence of a nurse.

For the actual work of rehabilitation, each patient after examination was transferred to the medical agency, where it a clinic or a private physician who had already been treating the patient. Those applicants who had no record of treatment prior to the examination were transferred to the agency necessary for measures of rehabilitation.

It is well to emphasize here that no treatment of any kind was given or was suggested by the medical staff. It is worth while noting that, in a few cases in which there was a difference of opinion between the private physician treating the patient and the physician at the clinic, a conference between the two so ironed

HYPERTENSION

The most frequent cause of disability found was hypertension, with 141 men and 295 women totaling 436 under this head. Among the age groups the greater number of patients with hypertension were found at ages 50 to 59, 168 cases being recorded. The women under this group far outnumbered the men (116 to 52). The number of Negro women with hypertension was naturally greater than that of Negro men (70 to 14) because more Negro women were examined than Negro men in this group. Among the 148 patients with hypertension at 60 and over the women again outnumbered the men 91 to 57. The Negro women in this group numbered less than the white women (34 to 57).

HEART DISEASE

The unemployment disabilities caused by diseases of the heart numbered two hundred and eighty-three; one hundred and twenty-eight of these were among Negroes. The men numbered 181 to 102 women. The majority of instances of heart disease were found among the older groups, with 101 cases among those aged 50 to 59 years. There were more Negro women with this diagnosis than white women (35 to 33). This excess of Negro patients was not noticeable among the men, the white men numbering 18 as against 15 Negroes. At 60 years and over there was a preponderance of women (58 as against 36 men). In the younger group,

aged 40 to 49, there were 63 cases, 39 being among women. The Negroes in this group were 14 as against 10 white men, and among the women there were 26 Negro to 13 white women. In the age groups under 40 years there were 25 cases of heart disease, 16 among women.

ARTHRITIS

There were 105 cases of arthritis recorded (38 men and 67 women). The majority of the patients—more than 90 per cent—were of course over 40 years of age. There was a slight preponderance (34 to 33) of white women over Negro women at all ages. Among the men the proportion of whites and Negroes was about the same.

SYPHILIS

Syphilis was the cause of incapacity in 85 instances (24 men and 61 women). The Negro women with syphilis were far in excess of the white women (52 as against 9). Only 1 man and 1 woman, both Negroes, were less than 30 years of age.

TUBERCULOSIS

Tuberculosis was the cause of disability in 61 instances (44 men and 17 women). About half of these were Negroes (21 as against 40). Among the 44 men so infected, 16 were aged between 30 and 39 years and 14 between 40 and 49 years. There were 10 aged over 50; only 1 of these was a Negro. Among the 17 women with tuberculosis, 13 were under 40 years of age of whom 7 were Negroes.

DIABETES

Diabetes was diagnosed in 58 patients (20 men and 38 women); 15 of the women were Negroes. None of these patients were under 40 years of age. In the age period 20 to 49 years there were 16 cases, 10 being among white persons and 6 among Negroes. At the ages of 50 and over there were 42 cases, 29 among women and 13 among men. Among the women with diabetes at 50 years and over 9 were Negroes.

OTHER CAUSES

Most prominent among the other causes of disability was the menopause, with 44 cases, 14 among Negro and 30 among white women. Asthma was recorded thirty-one times, with 23 cases among white persons, the majority of them men. Cholecystitis was reported in 23 persons, the majority (20) being white. Hernia as a cause of disability was reported in 22 cases. The cases were more frequent (14 to 8) among white persons and among white men (11 in men to 3 in women). Obesity was responsible for the disability of 29 persons, the majority of cases occurring among the Negroes (16 as compared with 13 white persons). Paralysis of various types occurred in 21 instances, 14 among white persons and 7 among Negroes. Varicose veins was given as a cause in 17 instances, 11 among whites and 6 among Negroes, mostly women. The same preponderance was observed among white women.

Gastric ulcer was reported in 15 instances and epilepsy in 14. Most instances of the latter were among white persons (9 of them to 5 Negroes). Anemia was reported in 14 instances and senility in 8.

AN ESTIMATE OF THE VALUE OF THE CLINIC

To summarize the work so far done in the clinic, it is clear that the constant supervision and the rapid and complete recording of all unemployable persons, together with the degree of their disability, have been of inestimable value to the welfare department. For

the first time a scientific and accurate record has been kept, together with a procedure for rehabilitation, which has tended so far to cut down considerably the list of unemployable persons.

The clinic has given every applicant for disability the benefit of a careful examination. There can be no doubt that the setup of this clinic has definitely aided in weeding out many malingerers and has made many such persons think twice before embarking on a path of false claims. It has fulfilled a useful purpose in reducing the number of clients for relief claiming inability to work. It has rendered more secure the position of actually unfit persons in their claims for relief and has established the need for employment of a nature to suit those whose disability does not render them unfit for some type of light employment. In this respect, there is evident need for more WPA projects for light work only to be open to those on file in the medical clinic records.

Through the cooperation of the two departments of health and welfare, problems of institutional needs have been met with the least delay and with little lost motion. There has thus been brought about a general saving of time, effort and money.

The establishment of this clinic as an innovation has rendered possible the referring of all cases from the city dispensary involving lengthy examination and reports, particularly in those instances in which patients claimed disability due to surgical injury, and the determination of the measure of employability.

INTRANASAL THERAPY WITH SODIUM SALT OF SULFATHIAZOLE IN CHRONIC SINUSITIS

FREDERICK MYLES TURNBULL, M.D.

LOS ANGELES

For many years I have followed the various vaccine and chemical treatments for chronic sinusitis. The vaccines have been used both hypodermically and locally as a filtrate with disappointing results. Every new treatment from the Carrel-Dakin down to the recent treatment with sulfanilamides and azosulfamide solutions has been used in the sinuses, and while the 2.5 per cent solution of azosulfamide used as a spray in the nose and throat has been giving favorable results in infections of acute involvement, such as in the recent epidemic of influenza, and apparently is a preventive to a certain extent in this infection, no results were obtained with it in the treatment of chronic infections of the sinuses.

Cultures taken of material from the sinus in many cases of chronic sinusitis over a long period have shown that the predominating organism is the staphylococcus, so that when sulfamethylthiazole was introduced it seemed especially suitable in this type of case. However, the sulfamethylthiazole was soluble only to the extent of 200 mg. per liter, or a 0.02 per cent solution. One would think that this would be entirely ineffective, but the first patient for whom I used it was a child who had had an infection over a period of about a year, so that there was a beginning atrophic rhinitis with considerable scabbing. I used it as a spray in the nasal cavities, and it was striking to see this condition clear up in a period of three weeks, although the child had undergone a great many other treatments during

the previous year. The scabs and pus disappeared, the circulation returned to the mucous membrane and the turbinates returned to normal size. The culture of material taken from the nose in this case showed a pure growth of hemolytic *Staphylococcus aureus*. This was the only instance in which sulfamethylthiazole was prescribed as a nasal spray to be used by the patient at home. A number of other patients were treated by instillation of the sulfamethylthiazole into the sinuses with no apparent results.

The sulfamethylthiazole was then withdrawn from investigational use, and five months ago I obtained a supply of the sodium salt of the sulfathiazole.¹ I started using a 5 per cent (normal) solution of this and have continued to do so. I obtained the best results by using it as a spray.

Among 47 patients with chronic sinusitis all but 7 reported definite improvement and relief of symptoms. On 4 of the 7 I have had no report. Of the 3 reporting no improvement, 2 had hay fever and 1 was fighting an influenza infection and at the present writing is showing symptomatic improvement.

Of the 40 patients reporting improvement, 20 showed an increase in drainage, with definite relief of symptoms

swelling or stuffiness of the nose. From examination it is shown that some shrinking takes place, and drainage from the sinuses is noted.

The sulfathiazole was used in two cases of chronic conjunctivitis in which the infection showed staphylococci, and both were secondary to chronic sinusitis. Both of these cases had been under extensive treatment by ophthalmologists and both cleared up promptly with the 5 per cent solution of sodium sulfathiazole instilled into the eye. There were no symptoms of irritation from its use.

I used the solution in five cases of chronic suppurative disease of the ear with striking results. Four cases cleared up and one improved. A man aged 31 had had a discharge from the ear since he was 5 years old. Many things had been tried over a three year period of treatment but there had still been some discharge. Within three weeks after treatment with 5 per cent solution of sulfathiazole instilled into the ear every night, the discharge had disappeared. A woman aged 58 who had had suppurative ears for forty-two years and chronic mastoiditis for the same period of time reported that there had been no odor, and the discharge has almost disappeared since the sulfathiazole solution has been used.

The ages of the patients treated ranged from 13 to 78 years. Blood counts taken before and after treatment ranged from 6,570,000 erythrocytes to 3,910,000, hemoglobin from 127 per cent to 60 per cent and leukocytes from 20,450 to 3,950. The 3,950 leukocyte count was the only one below 4,000, and this patient had been treated previously with sulfanilamide used intraorally. Blood counts were made at least twice a week on all patients, and on most patients daily. There has been in no instance any breaking down of the leukocytes, erythrocytes or hemoglobin. There have been no toxic symptoms whatever, even when the solution has been used as a nasal spray over a period of five months.

Cultures were taken in 26 cases, with the results shown in the accompanying table. Twenty-five of this group were those in which improvement was reported. A culture taken in 1 case of the group in which there was no improvement showed no growth in the nose.

The solution was found to be not stable over a long period when exposed to light and air, and it has a moderate tendency to crystallize and turn yellow. Fresh solutions should be used.

SUMMARY AND CONCLUSIONS

A 5 per cent solution of the sodium salt of sulfathiazole was found to bring greater relief from the symptoms of chronic sinusitis when used as a nasal spray than any other preparation that I have used. In only 2 cases out of 47 were unfavorable symptoms reported. Both were acute attacks of hay fever, and there was swelling and blocking of the nose. Forty of 47 patients who reported definite symptomatic relief stated that it relieved congestion, opened the nasal passages, promoted drainage and relieved pressure headaches. There was no granulocytopenia and no hemoglobinuria.

Sulfathiazole seems a perfectly safe procedure, and the results obtained in cases of chronic sinusitis seem to justify further investigation and would also suggest investigation in other involvements due to staphylococcal infections on account of the solubility of the sodium salt.

and opening of the nasal passages. Twenty reported no increase in discharge, but nevertheless there was symptomatic relief. None of the entire group of 47 complained of sneezing as an aftermath of the treatment.

Many of these patients had heaviness, fulness and pressure over the maxillary or frontal sinuses, and patients obtained quick and almost complete relief from these symptoms without recurrence over a period of from one week to five months.

I have also used this 5 per cent solution by instilling it directly into the sphenoids and maxillary sinuses after an operation and in nonoperative chronic infections of the sinuses. To date I have not been able to draw any definite conclusions of improvement by instilling it into the sinuses. There has been no decided diminution in the amount of discharge or in the symptoms. However, the patients who have been allowed to spray the nose twice a day with the 5 per cent solution of sodium sulfathiazole have consistently reported symptomatic relief. They have consistently reported that the nose has been more free, that there is better breathing space and that there is a considerable amount of drainage from the nose and down the throat within a period of less than half an hour after using the spray. This apparently is not drainage produced by stimulation of the membrane, as there is no sneezing and no

Clinical Notes, Suggestions and New Instruments

AMERICAN Q FEVER

REPORT OF A PROBABLE CASE

M. B. HESDORFFER, M.D., AND J. A. DUFFALO, M.D., MISSOULA, MONT.

In 1938 Davis and Cox¹ reported the isolation of a filter-passing infectious agent from *Dermacentor andersoni* collected near Nine Mile Creek in Montana, and Parker and Davis,² its experimental transmission by ticks. Cox³ described the rickettsia-like characteristics of the organism associated with the infection, and Dyer⁴ reported the first case in human beings, which was apparently a laboratory infection. More recently Cox⁵ has suggested the name *Rickettsia diaporica* for the causative agent and American Q fever to designate the disease.⁶

In 1940 Hornibrook and Nelson⁷ described the epidemiology and clinical characteristics of an outbreak of pneumonitis which occurred among employees of the National Institute of Health at Washington, D. C. Bacteriologic studies carried out by Dyer, Topping and Bengtson⁸ showed this outbreak to be the rickettsial disease American Q fever. These authors stated that the chief characteristic of this illness was "central pneumonia which would have been unrecognized in the absence of roentgen examination of the chest."

A comparison of their cases with numerous similar cases reported in the literature⁹ suggests that American Q fever may be widespread.

It is our purpose in this communication to report an illness which on the evidence of clinical and laboratory observations appeared to be a case of American Q fever.

REPORT OF CASE

W. L., a white man aged 20, a university student, worked in the woods cutting Christmas trees on Nov. 16 and again on Nov. 22, 1940. On the latter date his clothing became wet and he undressed in the woods to warm himself and dry his clothing. On November 25 he noticed a slight infection of the respiratory tract which did not respond to treatment as readily as other "colds" had. About December 1, the patient noticed a vague discomfort in the right side of the abdomen. His bowels were severely constipated and he noticed considerable gaseous distention and flatus. Up to this time he had experienced no nausea or vomiting. The discomfort became increasingly more severe, and on the night of December 10 he had a chill. Repeated questioning did not elicit a history of a tick bite.

On admission to the hospital December 13 the temperature was 100 F., the pulse rate 96 and the respiratory rate 22. There was considerable gaseous distention of the entire abdomen, with a peculiar "boggy" feel to the cecum. This "bogginess" was associated with some tenderness. The white blood cell count was 21,950 with 82 per cent polymorphonuclear leukocytes and 18 per cent small lymphocytes. A rectal examination revealed no abnormalities, and a small enema with tap water relieved the distention.

Fig. 1.—Clinical course from Dec. 13 to Dec. 21, 1940 inclusive (sulfathiazole therapy started on fourth hospital day).

On the fourth day of hospitalization there was a loss of appetite, associated with nausea and vomiting in the afternoon. Later that day, the patient experienced a severe chill and the temperature rose to 102.4 F. (fig. 1). The white blood cell count was 16,150 with 80 per cent polymorphonuclear leukocytes, 18 per cent small lymphocytes and 2 per cent eosinophils.

Agglutination tests on specimens of serum taken that evening failed to show the presence of *Bacillus typhosus*, *Bacillus paratyphosus*, *Brucella abortus* or *Bacillus tularensis*. *Bacillus proteus* X 19 was not agglutinated in significant titer.

A roentgenogram of the chest was made in spite of the apparent normalcy revealed by auscultation and percussion. It showed diffuse, patchy pneumonitis involving the upper lobe of the left lung (fig. 2).

On therapy with sulfathiazole the patient improved, the temperature returning to normal by lysis on the eighth day (December 21).

In view of the roentgen appearance it was suggested by Dr.

Herald R. Cox, principal bacteriologist of the Rocky Mountain Laboratory, United States Public Health Service, that tests be made to determine whether perchance the patient had American Q fever. A sample of blood taken on December 20 was tested by Dr. Cox for the organism causing American Q fever by the inoculation of guinea pigs and by agglutination against a suspension of *R. diaporica*. The inoculated guinea pigs failed to show any evidence of American Q fever, but the serum showed positive agglutination for *R. diaporica* in a dilution of 1:80.

Fig. 2.—Fine diffuse patchy pneumonitis involving left upper lobe.

A second sample of blood taken on Jan. 15, 1941 likewise showed positive agglutination for *R. diaporica*, this time in a dilution of 1:160.

COMMENT

The results of the agglutination tests suggest that the patient had American Q fever. These results are supported by the fact that the patient showed pneumonitis, which would have gone unrecognized without the use of roentgenograms and which, as we have already noted, was one of the cardinal features of the outbreak of American Q fever described by Hornibrook and Nelson⁷ and Dyer, Topping and Bengtson.⁸

If this was a case of American Q fever, as seems likely, how was the infection acquired?

The patient had worked in the woods cutting Christmas trees in November. He had drunk from mountain streams. He had no knowledge of a tick bite and, considering the season of the year, a tick bite would seem to be highly improbable. However, the weather that fall had been unusually mild, and there is a slight possibility that a tick could have become attached at the time the patient undressed to warm himself and dry his clothes.

A patient with a similar illness was treated by Dr. C. C. Tefft of Hamilton, Mont., in the late fall of 1939: A white man aged 37 had a febrile condition which was practically identical in all clinical features with that described by us. A strain of organisms causing American Q fever was isolated at the Rocky Mountain Laboratory from a sample of blood taken on the third day after onset, and samples taken later, during the period of convalescence, showed positive agglutination against *R. diaporica*. No evidence was obtained as to how the patient acquired the infection. He had hunted on the east fork of the Bitter Root River for several days in early October but stated that he had had no contact of any kind with animals. He had drunk from mountain streams, as had a number of other persons with him on the trip, but he was the only one to become ill. No history of tick bite, which as we have already pointed out is unlikely at this time of year, was to be obtained.

SUMMARY

The illness of a young man was characterized by pneumonitis that was recognized only by the aid of roentgenograms. Samples of serum taken during convalescence showed positive agglutination against *R. diaporica*, strongly suggesting American Q fever.

HUMAN INFECTION WITH PASTEURELLA LEPISEPTICA FOLLOWING A RABBIT BITE

PAUL L. BOISVERT, M.D., AND MILDRED D. FOUSEK
NEW HAVEN, CONN.

We wish to describe an example of human infection with *Pasteurella lepi-septica*. The reason for making the report is that few such cases have been described and in this instance the source of infection was believed to be a rabbit.

In 1938 Lévy-Bruhl¹ reviewed the literature in a discussion of pasteurellosis in man. Subsequent reports are as follows: Foerster² found an organism with the properties of animal *pasteurella* in the pleural exudate and in the lungs in 2 cases of pneumonia; Mulder³ repeatedly isolated the organism from the sputum of a child with bronchiectasis; Plette⁴ cultured *Pasteurella* from the pleural fluid of a man with pleural and pericardial effusion and Le Chuiton, Bideau and Pennanéac'h⁵ recovered a strain from the spinal fluid of a patient with meningitis following a skull fracture.

REPORT OF CASE

History.—N. C., a white man aged 53, the caretaker of animals in our department, was bitten on the right index finger by a rabbit. The rabbit had had some nasal discharge and

there had been snuffles in the colony for several weeks. The accident occurred about 4 o'clock on the afternoon of Feb. 18, 1938, and the wound, which was small, was washed with soap and water. During the night the finger became red, swollen and painful. The following morning the patient entered the emergency ward of the hospital for treatment. Examination showed a 1 cm. linear laceration at the base of the right index finger with redness and swelling of the entire finger. The wound was cleansed with liquid soap and alcohol, cauterized with nitric acid and dressed. Tetanus antitoxin was administered in divided doses after desensitization of the patient. The use of hot magnesium sulfate compresses at home was advised. On February 20 the infection began to spread over the dorsum of the hand and by March 7 extended up the forearm. At that time the patient was admitted to the surgical ward.

Examination.—The patient was well developed and well nourished and did not appear acutely ill. The temperature on admission was 97.8 F., and the pulse rate 66 per minute. The abnormalities were limited to the right upper extremity. There was a dry, healing lesion at the base of the right index finger. The dorsum of the hand was red, swollen and tender, with redness and increased heat extending up the dorsal surface of the forearm midway to the elbow. There was no local glandular enlargement.

The red blood cell count was 4,700,000, with 14.5 Gm. of hemoglobin; the white blood cell count was 20,350, with 82 per cent polymorphonuclear leukocytes on admission falling to 10,800 with 63 per cent polymorphonuclear leukocytes at the time of discharge. The urine gave a 1 plus reaction for albumin.

Characteristics of Strain from Human Abscess

Strain	Fermentation of*									
	Motility	Gelatin	Indole	Litmus Milk	Dextrose	Saccharose	Mannitol	Levulose	Maltose	Mouse Virulence
N. C.	—	—	+	—	A	A	A	A	A (slight)	+

* A, production of acid without gas.

There were no casts or cellular elements in the sediment. Culture of the blood showed no growth in the broth or in the pour plate.

Course.—The patient's course was afebrile. With continuous hot saline compresses the redness and edema subsided, and the patient was discharged home on March 11 with instructions to keep the arm elevated in a sling. A few days later the hand again became painful, and on March 18 the patient returned to the emergency ward with a fluctuant area about 4 cm. in diameter on the dorsum of the hand. Under local anesthesia the abscess was incised, and about 5 cc. of seropurulent material was released. Cultures were taken and a drain was inserted. The drain was removed in one week, and healing was complete by April 1. There were no residual symptoms.

Bacteriologic Examination.—A culture of the pus from the incised abscess yielded a pure growth of small, ovoid, pleomorphic bacilli which were gram negative and showed bipolar staining. They occurred singly, in pairs and in small groups. The motility test gave negative results. After twenty-four hours' incubation on blood agar plates (beef heart infusion agar with 5 per cent rabbit's blood), grayish yellow colonies were visible which measured 1 to 2 mm. in diameter. The colonies were smooth, translucent, convex and of mucoid consistency with an unusual, penetrating odor. There was no hemolysis, but the plate was slightly cleared and brown. By test, the organisms did not produce a soluble hemolysin for rabbit erythrocytes. Growth on plain agar plates was less profuse than on blood agar. Growth in blood broth for twenty-four hours produced a moderately cloudy supernatant fluid with a slightly viscous deposit in the bottom of the tube.

The organisms produced acid but not gas in dextrose, saccharose, mannitol, levulose and maltose (slightly). Lactose was not fermented. Indole was formed. There was no liquefaction of gelatin. Litmus milk was unchanged. These results are shown in the accompanying table.

Dr. Caspar G. Burn helped the authors in this work.
Aided by a grant from the Fluid Research Fund of the Yale University School of Medicine.
From the Department of Pediatrics, Yale University School of Medicine, and the Pediatric Service of the New Haven Hospital and Dispensary.

5. Le Chuiton, F.; Bideau, J., and Pennanéac'h, J.: Compt. rend. Soc. de biol. 130: 1096, 1939.

The intraperitoneal inoculation of white mice with 0.2 cc. of an eighteen hour broth culture resulted in death in twenty-four to forty-eight hours. Autopsy revealed an acutely inflamed peritoneum with multiple small hemorrhages. The organisms were visible in large numbers in stained smears and cultures taken of material from the peritoneum and of the heart's blood.

A sample of the blood serum of the patient obtained on June 7 failed to agglutinate the organism.

Organisms which were morphologically and culturally identical with those obtained from the patient were present in considerable numbers in cultures taken of material from the nose of the rabbit.

Special Article

GLANDULAR PHYSIOLOGY AND THERAPY THERAPEUTICS OF TESTICULAR DYSFUNCTION

JAMES B. HAMILTON
NEW HAVEN, CONN.

This special article is published under the auspices of the Council on Pharmacy and Chemistry. It is one of a series which will be published in book form as the second edition of "Glandular Physiology and Therapy." The opinions expressed in this article are those of the author and do not necessarily represent the views of the Council.—Ed.

The first major advancements in endocrinologic knowledge came from studies pertaining to the testis. Aristotle¹ recognized that the absence of the testis is responsible for the changes observed in castrate animals and man. In 1849 Berthold² concluded that the testis produces an internal secretion, since capons with an implanted testis have comb growth and other characteristics of the cock. Thereafter, the study of testicular function lagged behind that of other ductless glands until, as a result of intensive study³ during the last decade, the status of androgenic substances shifted abruptly from that of relatively unknown materials to that of highly active crystalline compounds that can be prepared synthetically and are available for therapeutic use.

The androgens of chief interest in therapeutics are testosterone, a substance isolated from testis tissue (of the bull⁴), and androsterone and dehydroisandrosterone, which are excreted in human urine.⁵ Clinically, testosterone is the compound used at present almost exclusively. For intramuscular injections, the propionic

ester of testosterone is utilized, as it provides prolonged action. The nonesterified form may be found more effective percutaneously and in implanted pellets, but these modes of administration are still largely in the experimental stage.

The rationale in therapy with androgens is either that of substitution in conditions characterized by deficiency of testicular secretions, or that of utilization of pharmacologic actions in states in which actual deficiency of testicular secretions is not present or is in doubt. For a proper understanding of the uses, limitations and dangers of androgens, it is essential to appreciate (1) the relationship between the testis and the pituitary, (2) the sequelae of castration and of eunuchoidism (underdevelopment of the testis) and, conversely, (3) the bodily functions and morphologic changes promoted by androgens.

RELATIONSHIP BETWEEN THE TESTIS AND THE ANTERIOR LOBE OF THE PITUITARY GLAND

The testis has two rather distinct functions, spermatogenic and endocrinous. Both functions are induced by, and dependent for maintenance on, gonadotropins from the anterior lobe of the pituitary. In turn, testicular secretions limit the production by the pituitary of gonad-stimulating material.⁶ Thus, a loss of testicular function leads to increased secretion of gonadotropins, whereas the administration of exogenous androgens suppresses production of the gonadotropic substances. Therefore, titers of urinary gonadotropins may serve to indicate whether the atrophy or underdevelopment of the testis is primarily referable to testicular hyposecretion or is secondary to lesions of the pituitary or of the brain stem. From the standpoint of replacement therapy, however, such methods of distinguishing between primary and secondary hypogonadism in the male are of limited value. Primary hypogonadism is usually obvious, as for example after bilateral orchectomy or overt damage of the testes, such as an interruption of the blood supply during repair of hernia. Even if the eunuchoidism is secondary, no means of initiating spermatogenesis is known at present.

CASTRATION AND EUNUCHOIDISM⁷

The extent of the abnormality resulting from insufficiency of testicular secretion depends on the degree of secretory deficiency and on the age of the patient at the onset of the condition. There are two distinct types, that in which the onset of deficiency occurred before sexual maturity and that in which it was delayed until after sexual maturity.

Prepuberal Onset of Testicular Insufficiency.—Prepuberal deficiency of testicular secretion gives rise to the eunuchoid state, in which the genitalia remain small and the skeleton is characterized by extraordinary length of the long limb bones, associated with delay of epiphyseal union. The voice retains a high pitch, and the larynx, although larger than that of a child, does not have the prominence of the thyroid cartilage or the size of that of the adult male. The beard is usually composed of only fine hair, shaving being more a matter of desire than of necessity. The bodily proportions, a lack of muscular development and in some cases a characteristic distribution of adipose tissue—

From the Department of Anatomy, Yale University School of Medicine.

7. In eunuchoidism, a eunuch-like state, the testes are present but do not secrete properly; the range of patients is from those like castrates to those more like normal men.

along with the lack of beard and manly voice—have given rise to incorrect allusions to femininity.

Postpuberal Onset of Testicular Insufficiency.—Postpuberal interruption of testicular function does not produce all the sequelae observed following the prepuberal onset of testicular insufficiency. Eunuchoid proportions of the long bones are not observed if the epiphyses are already closed. The secondary sexual characters show regression, but such organs as the larynx and genitalia do not return to an immature state. An adult character of voice is retained⁸ and, with variation from subject to subject, a limited degree of sexual ability and desire.

Phenomena Characteristic of Castration and Eunuchoidism.—Castrate and eunuchoid persons are excellent subjects for study of both the phenomena of testicular insufficiency and the effects produced by androgens. The widespread physiologic effects of "sex hormones" described in the following paragraphs serve to dispel the prevalent erroneous notion that the influence of testicular secretions extends only in the sphere of reproductive purposes:

1. Absence of spermatozoa and testicular secretions: The most obvious derangements in the castrate man are the lack of spermatozoa and the low levels of androgens in the bodily fluids. According to Gallagher and co-workers,⁹ normal men excrete in the urine an average of about 66 international units of androgen per twenty-four hours, whereas the amount of androgenic material excreted by castrate and eunuchoid men is much less.¹⁰

2. Integument: The skin is soft, and the face viewed from a distance appears to be that of a young person. Closer inspection reveals the absence of deep furrows and in the older men the presence of numerous fine wrinkles. The skin is characteristically of a pasty, sallow color, due to lack of cutaneous pigments¹¹ rather than to anemia. Spectrophotometric analyses¹² indicate that the volume of blood in the skin and the percentage of oxygenated hemoglobin are less than in normal men. In certain areas like the buttocks, however, which contain a goodly amount of "venous" blood (a high proportion of reduced hemoglobin), there is more blood than in normal men. Melanin is present in less than average amounts.

The skin and hair are dry and the sebaceous secretions apparently diminished. Acne does not occur in the person who does not mature sexually.¹³

Dermal appendages are affected, especially the hair. The beard of the eunuchoid is soft and not entirely unlike that of an adolescent, whereas the postpuberal castrate retains many hairs of large diameter and may require shaving once or more each week. The axillary and pubic hair is of fine texture and of limited amount. Other hair on the trunk and that of the limbs is not of the coarse, thick type typical of secondary sexual hair. Eyebrows are present but are less bushy, and there is lacking the hair between the eyebrows that was present before postpuberal castration and that returns on androgenic therapy. None of the eunuchoids in our series were bald, although in some of the families other male members were bald; the hair over each temple extended well toward the lateral edge of the eyebrow.

3. Adiposity: In both eunuchoid and castrate men adipose tissue may be deposited subcutaneously, being particularly prominent about the mammae and over the trochanter and mons

pubis. Such adiposity is absent, however, in many castrate or eunuchoid persons, some of whom have had marked testicular insufficiency for as long as forty years.

4. Voice: In the eunuchoid the vocal pitch and range are high, for example, a range from D above middle C to the third E above middle C, with the pitch in conversation F above middle C (frequency per second: range, 294 to 1,319; pitch, 349). The mature voice of the postpuberal castrate is largely maintained, as shown by the range of one patient from the second G below middle C to E above middle C, with a pitch during low conversation of B below middle C (frequency per second: range, 98 to 330; pitch, 247).⁸

5. Circulation: A characteristic derangement of the blood content of the skin of the castrated man was described under item 2 in this list. Hot flushes, similar to those in some women at the menopause or after bilateral oophorectomy, occur frequently and if severe are followed by sweating. With four exceptions, the systolic blood pressure in 14 of the patients in our series has been only slightly more than 100 mm. of mercury. The chief complaint of many patients is fatigue and inability to carry on work. The data pertaining to circulatory fitness in such patients are scanty as yet, and there is difficulty in distinguishing which disturbances are primarily circulatory and what roles metabolic and other factors play. It is unwise to do more than indicate that derangements of the circulatory system occur and that administration of testosterone results, possibly indirectly, in circulatory changes in castrate men.

6. Genitourinary system: In the eunuchoid man the external genitalia are indicative of the underdeveloped state of the internal genitalia. The penis is not unlike that of a newborn child, the scrotum a flat band, without pendulousness or sacklike form, and the epididymis so tiny as to defy attempts by palpation to establish its contour. The prostate and seminal vesicles may be so small as to be recognized on rectal palpation only with difficulty and uncertainty. In eunuchoidism of this severity the urinary stream is of small diameter and may not be of great force. In the man castrated after sexual maturation the genitalia remain large save for the scrotum, the size of which is apparently dependent in part on the enclosed organs.¹⁴ In white men the skin of the scrotum and penis loses much of the dark brown color, and the raphe is not prominent.

In general, penile erections are of limited number and completeness. Notable exceptions occur. Two men surgically castrate for twenty-two and thirteen years, respectively, had erections that would permit satisfactory intercourse despite obvious organic and functional evidence of castration, including extremely low levels of urinary androgenic activity (8 and 5 international units, respectively, per twenty-four hours). Such facts serve as an argument against any theory that erectile capacity is due to androgens of extragonadal source. The ejaculate in 4 instances amounted to only a minim.

7. Behavior: Judgment as to irregularities of behavior in these patients is fraught with error, for the mere appreciation that sexual defects are present is in itself psychologic trauma of a high degree. Many authors classify the eunuch or eunuchoid man as sullen or untrustworthy, but detailed examination reveals different individual traits and not necessarily a particular personality pattern.¹⁵

Caution must be exercised in distinguishing the effects of senility from those that can be properly accredited to testicular insufficiency. In advanced age any decrease in gonadal function is blended closely in ordinary experience with matters in the domain of geriatrics. This has led to the deplorable, and perhaps wishful, thought that restoration of testis function produces rejuvenation.

Therapeutic Indications.—The use of androgens is clearly indicated after bilateral orchiectomy or in severe eunuchoidism. A few patients are able to compensate for their defects and make fairly adequate adjustments, but the majority complain of fatigability,

sexual incapacity and other sequelae of testicular insufficiency.

Widely divergent opinions are held, however, regarding the management of the boy in his early teens who is not exhibiting the usual signs of sexual maturation. There is no uniform age for the onset of puberty, and unfortunately the armamentarium does not include as yet a technic for differentiation with certainty between boys with delayed maturation and those who will never mature properly.

The benefits from early treatment with endocrine preparations must be questioned and compared with the limitations and dangers imposed. Many phenomena characteristic of testicular insufficiency disappear while the patient receives treatment, but the only permanent changes thought to be avoided by the early adoption of endocrine measures are the skeletal proportions of eunuchoidism. Possibly escape might be had from some of the psychologic trauma experienced by the sexually immature, but it is debatable whether early acceptance of a need for continued replacement therapy is more comforting than the hope of eventual establishment of normal physiologic functions.

In opposition to hastily undertaken procedures is the fact that a large percentage of the boys with less evidence of sexual maturation than their associates do eventually mature. The misconception has arisen that endocrine treatment will encourage the body to assume normal reproductive functions. Suffice it to say, there exists no basis for the belief that temporary use of gonadotropins or androgens will result in the initiation and continuance of normal testicular activities. Instead, possible dangers have been indicated by the report of precocious closure¹⁶ of the epiphyses following administration of large amounts of androgens.

Moreover, it must be remembered that in some instances sexual immaturity is complicated by hypothyroidism or other conditions not amenable to treatment with androgens or gonadotropins.

In my opinion the rationale for the early use of gonadotropic or androgenic therapy in males with less than average sexual maturity at the age of adolescence is the prevention of eunuchoid changes that would otherwise be permanent. The known preventable defects are chiefly skeletal and are believed to be due to prolongation of the period of growth beyond the ordinary chronologic time of epiphyseal union, not to any augmentation of growth at an early time. Thus it seems possible to control skeletal growth even if endocrine treatment is withheld until the probability of normal body function has been excluded. Extended delay until the patient is stigmatized by a markedly eunuchoidal stature is not countenanced. In brief, the facts now available suggest that there is little gain and that there may be harm in the early administration of gonadotropic or androgenic preparations to boys with delayed maturation.

Drug, Dose and Route of Administration.—Both gonadotropins and androgens have been used in the therapy of eunuchoidism. Obviously gonadotropins depend, for their effects, on the capacity of the testis to secrete androgens and hence are of no avail in the case of the castrate or of the person whose testes are

not responsive.¹⁷ Moreover, since gonadotropins do not initiate spermatogenesis, direct therapy with a stable crystalline androgenic drug is preferable to stimulating testicular secretion to a variable degree with an extract containing proteins. If in the future more satisfactory preparations of gonadotropic substances are developed and proved capable of initiating spermatogenesis, this choice of management is subject to modification.

Pharmaceutic houses prepare ampules with 25 mg. of testosterone propionate per cubic centimeter, an amount which has been stated to be a satisfactory daily dose.¹⁸ In our experience 20 mg. of testosterone propionate in 1 cc. of oil injected intramuscularly six or seven times a week has been satisfactory in all but a single instance. The injection of 20 mg. three times a week has not been adequate for good clinical effect and has not been sufficient to maintain urinary androgens at the average levels found in normal men.

Deanesly and Parkes¹⁹ demonstrated that subcutaneous implantation of testosterone in the form of compressed pellets is economical and requires replacement only at long intervals. A more prolonged and even course of stimulation is obtained than with other methods.²⁰ A trocar has been described²¹ for use with the human subject, but no discussion has been given of the important matter of the surface area of the pellets. We have observed satisfactory stimulation in the eunuch following implantation of 4 pellets of testosterone each of which is 5 mm. in diameter and 7 mm. in length, with a total surface area of about 750 sq. mm. and a total weight of 960 mg. The dangers in treatment with even small pellets are apparent, and it is regrettable if women or other persons who do not require intensive treatment are subjected to long-continued influence of androgenic substances.

On oral administration, testosterone propionate is absorbed from the gastrointestinal tract²² and a degradation product, androsterone, is excreted by the kidney,²³ but the clinical benefit is slight.²² Apparently such substances are inactivated by the liver.²⁴ Methyltestosterone by mouth exerts an androgenic influence but curiously produces only minor elevation of the titer of urinary androgenic activity.²⁵ As quantities greater in weight than those of testosterone propionate given intramuscularly are necessary to induce androgenic effects, this method is so expensive as to be impracticable at present. Androgens secreted by the testes

and those absorbed from intramuscular or subcutaneous routes of administration are favored by pathways of blood flow to escape for some time the influence of the liver. The use of rectal suppositories emphasizes the expected difficulties intrinsic in this mode of administration.

Percutaneous administration has been publicized, but information is lacking concerning proper doses and intervals between applications that would maintain fairly constant levels of the drug in body tissues and fluids. The simplicity of this method of application, which permits self treatment by the patient, admits by the same expedient that control of the medication is subject to the whims of the patient.

Results from the Administration of Testosterone Propionate.—Pronounced masculinization and disappearance of many of the phenomena characteristic of testicular insufficiency are obtained²⁶ even in persons castrate for more than two decades or in those whose eunuchoid state has persisted until the middle years of life. Within an hour there are changes in the blood volume and pigments of the skin.¹² Erectile ability may be enhanced, often within a matter of several hours, and spontaneous erections are particularly frequent during the first days after the beginning of treatment.

The genitalia, with the exception of the testes, are stimulated to considerable development. In the eunuchoid man the amount of growth is major, but with severe eunuchoidism, especially in older persons, long-continued treatment is required before there is attainment of a genital size approaching that of normal men.

The levels of androgenic substances in the urine are elevated and may be within the range found in normal men.²² This is largely due to the presence of androsterone.²⁷ Body weight may be increased by several pounds. In 4 eunuchoids²⁸ 1 to 4.5 Gm. of nitrogen were retained per day, the decreased level of urinary nitrogen being reflected in the urea fraction, without evidence of change in the nitrogenous components of the blood; there was also retention of urinary sodium, amounting to 0.33 to 0.55 Gm. daily, and usually of chloride. Muscular development and in some men strength are markedly increased.

The skin becomes flushed and of a darker color. Pigmentary abnormalities give way to a trend in the direction of the type and amount found in normal men. Thus there is increase in the volume of blood (save in areas like the buttocks), in the percentage of oxyhemoglobin and to a lesser extent in the amount of melanin and related substances.¹²

Increased oiliness of skin and hair becomes noticeable. In many but not all patients an acneiform response appears after a latent period of some weeks.

Growth of secondary sexual hair is rapid, the beard becoming stiffer within a few weeks, the axillary and pubic hair more coarse. Later the trunk and limbs acquire long thick hairs.

The vocal range and pitch of the eunuchoid approach those of the mature man. In the postpuberal castrate the pitch used in speaking may be lowered a tone or so and the voice sound hoarse. The mucous membrane of the larynx appears congested and rough, but the

change in vocal pitch and range in the eunuchoid can ensue without marked prominence of the tracheal cartilage or great enlargement of the laryngeal cartilages.

The testes do not assume normal function. Testosterone affords essentially substitution therapy so that administration of the substance must be continued if the results are to be maintained. Maturation of voice and to some extent of the accessory reproductive organs is retained, but regressive changes ensue on cessation of the medication. Obviously, the cost of continued replacement therapy is a matter of deep concern.

OTHER STATES OF TESTICULAR DYSFUNCTION

Cryptorchism.—Despite evidence to the contrary from short time experiments,²⁹ it appears that in long-continued cryptorchism less than normal amounts of androgens are produced,³⁰ but this is scarcely the main issue. More pertinent are the facts that the later stages of spermatogenesis do not ensue properly in testes not in the scrotum³¹ and that approximately 11 per cent of all testicular tumors are found in retained testes.³² Since the incidence of undescended testes in the adult male population is about 0.23 per cent, the correlation of tumor and imperfect descent is about forty-eight times greater than expected from chance association. There is no proof that the ectopic position is responsible for the high incidence of tumors in ectopic testes, but placement of the testis in the scrotum may allow at least an earlier recognition of a developing tumor. Because of the incomplete spermatogenesis and the possibilities of trauma and unobserved development of tumor, it is desirable that ectopic testes be transferred to the scrotum.

False versus True Retention: Intermittent retraction of the testicle continues to be commonly confused with true retention. This wrongly diagnosed condition would respond to any form of treatment, even to injection of saline solution or to mere choice of a more propitious moment for the examination. One cannot but be skeptical of optimistic reports of cases in which the testes descended in from three hours to three days, an alacrity that would put to shame a fast-growing tumor. Adoption of the following technic, full details of which are given elsewhere,¹¹ or of some similar method would allow differentiation between false and true retention and would provide a basis for comparison of the results in cases reported by different investigators:

The subject is placed as much at ease as possible while casual observation and brief palpation for the testes are done. A hot water bag wrapped in a single layer of flannel and containing water at about 115 F. is then put on the scrotum, groin and perineum. The patient is covered with blankets sufficient to insure warmth. Children in particular are reassured by the painlessness of the mock examination, and they can be examined thoroughly after the heat has been applied for

thirty minutes to induce relaxation of those muscles in the scrotum and groin which cause retraction of the testis.

A carefully taken history and the status of scrotal development provide valuable confirmatory evidence.

Correction of True Retention: Recognized procedures include the time-honored reliance on nature, the administration of endocrine products and orchiopexy. Reliance on nature to effect descent of the testes has in its favor tradition and the avoidance of rash procedures but has been criticized on the ground that, if descent is not spontaneous, irremediable changes may occur before corrective measures are applied. A final decision cannot be made in view of the fact that there are at present no thoroughly reliable data regarding the incidence of descent at puberty in cases of true cryptorchism. The available records are open to criticism on the ground that they include intermittently retracted testes. A well considered and substantiated body of opinion among surgeons, endocrinologists and pediatricians is necessary before the final choice is made between waiting a few years for the effect of natural puberty and alternative use at an early date of aggressive measures. It is urged that in the preparation of data a distinction be made between unilateral and bilateral cryptorchism, since in cases in which one testis has descended satisfactorily a state of endocrine deficiency, such as hypothyroidism, has been in my experience less frequent than in bilateral retention.

The commonly used endocrine preparations are chorionic gonadotropins, urinary extracts possessing luteinizing activity in the female. Enthusiastic reports have been made since these substances were first employed by Shapiro³³ and the method demonstrated experimentally in monkeys by Engle.³⁴ Critical study has shown that about one of every five retained testes responds to this treatment.³⁵ Androgens have been tested as an alternate choice, since presumably a gonadotropin exerts some of its actions by stimulating testicular secretion and since certain of the effects produced with luteinizing preparations can be duplicated with androgens. The results are discouraging,³⁶ however, indicating definitely that the administration of androgens is of little value in producing descent of testes.

In my opinion, endocrine substances should be expected, on rational grounds, to effect descent only in instances in which the body levels of these substances are low and there is no mechanical adhesion or other permanent barrier to progression of the testicle. The advisability of their use before the age of puberty must be evaluated with regard to the function and fate of the ectopic testis (with the realization, however, that the high incidence of testicular tumors is not found until some time after puberty), the dangers of excessive and long-continued administration of powerful endocrine compounds and the comparative effectiveness of exogenous and endogenous gonadotropins. Some surgeons are of the opinion that under endocrine stimulation the testes descend or, failing that, the scrotum and cord structures are stimulated to such growth that orchiopexy is more easily accomplished.

In any selection of methods of choice in the management of testicular retention, data furnished by the surgeons must weigh heavily, since cryptorchism remains, despite some enthusiasm for treatment with endocrine products, primarily and in most cases a surgical problem.

Sterility.—For purposes of brief discussion, sterility may be subdivided into factors related to spermatogenesis and factors related to transportation and deposition of sperm in the female reproductive tract.

Spermatogenesis is dependent on gonadotropic stimulation by secretions of the anterior lobe of the pituitary, residence of the testes in a site like the scrotum and satisfactory vascularization. It is now believed that spermatozoa capable of fertilizing human ova under normal conditions generally have at least a minimal count³⁷ per unit volume and only a certain proportion of abnormal forms.³⁸

In the rat, spermatogenesis can be maintained by androgens and stimulated or maintained by gonadotropins. In the primate, however, spermatogenesis is more difficult to control.³⁹ Claims have been advanced that under certain optimum conditions gonadotropins from urine⁴⁰ and androgens⁴¹ can increase the number of spermatozoa in man. It would appear, however, that with androgens the number of spermatozoa is decreased rather than increased⁴² and that no endocrine substance now available has been proved adequate for the stimulation of spermatogenesis in the eunuchoid man. The somewhat negative observations with present techniques argue only for conservative methods of treatment and do not preclude the possibility that in the future the use of endocrine substances will be applicable to the problem.

Difficulty of intromission is common, although in many of the purported cases it is questionable that the interest is solely that of fertility. Testosterone propionate increases the capacity for erections in men with deficient testicular secretions, but the ability to obtain erections depends on more than the presence in the body of androgens. Vigorous erections have been observed repeatedly in persons with pronounced organic and functional signs of testicular insufficiency and with undisputedly low titers of urinary androgenic activity. Moreover, even though the elicitation of erections in the young and the middle-aged castrate or eunuchoid man is abetted by androgens, it is not to be assumed that, because of the inexorabilities of age, old men present a comparable situation of testicular insufficiency. Of old men with the symptom complex of benign hypertrophy of the prostate who were given testosterone propionate in trial therapy, the capacity for erection was not augmented in all, and when present it proved to be distracting and ill adapted to the needs of both husband and wife.

Precocious or Abnormal Function of the Testis.—Hypersecretory states of many endocrine glands have been recognized, but thus far not of the testis—even though in the past few years such states might have been simulated as a result of the administration of large amounts of crystalline androgens to patients. Abnormal and precocious function of the testis is recognized. Certain testicular tumors produce enormous amounts of gonadotropic substances,⁴³ which serve for diagnosis and for ready identification of the presence and functional state of metastases. With more complete study of cases of abnormal testicular function, it may be that, in addition to precocious function, in which the effects seem to be largely due to stimulation by androgens at an early age, hypersecretory states will be distinguished. It must be recalled, however, that the human body possesses a great capacity for rapid inactivation of large amounts of androgenic substance.²²

States in Which Dysfunction of the Testis Is Dubious or Unproved and Conditions in Which Androgens Have Been Tried Because of Pharmacologic Actions.

—Perhaps the most widely known trial of testosterone for its pharmacologic actions unassociated with testicular functions is that in certain gynecologic disorders, but testosterone has also been employed in men in whom testicular insufficiency was questionable. The relation of the prostate to testicular secretions and the reactions of this gland to both estrogens and androgens led inevitably to tests of the usefulness of testosterone therapy in men with benign hypertrophy of the prostate. In evaluating claims of beneficial results it must be remembered that spontaneous improvement may occur and that androgens induce in some persons a sense of well-being entirely apart from the capacity to pass a stream of urine. Improvement in control of the urinary stream during administration of testosterone may not be due necessarily to any decrease in the size of the prostate and may, in a few instances, be accompanied by an apparent increase in the size of the prostate.⁴⁴ Further study would be more enlightening if in reports on the treatment of patients with the symptoms of benign hypertrophy of the prostate investigators would state not just the percentage of patients benefited but also the extent to which the claimed improvement correlates with the urologic condition and its changes, if any, in each patient.

The development of muscle and greater dynamometric strength when the castrate is given androgen and, indeed, the difference in this regard between the average man and woman have suggested the trial use of androgens in certain types of muscular weakness. In 2 men who had myotonia atrophica and genital atrophy a limited amount of improvement was obtained on administration of testosterone,⁴⁵ viz., a status approximately 25 per cent of that of the normal male. Regression followed discontinuance of treatment. No report has appeared in which androgens have been shown to be of value in the correction of muscular conditions not accompanied by diminished testicular secretion.

The interrelations of sexual and behavioral spheres have already induced studies of the use of testosterone

in various psychiatric conditions. In this regard it is unfortunate that the concept of rejuvenation has appealed to some investigators. Careful examination is necessary to distinguish any direct influence on behavior from effects due to recognition of the organic and functional changes produced by the androgen. One cannot but urge that controlled experiments be made, including the injection of plain oil and the withholding from the patient of information that the drug is a "sex hormone."

The effects of testosterone on vascular dynamics will undoubtedly lead to trials of this substance in certain of the peripheral vascular diseases.

With respect to the states in which testicular insufficiency is dubious and androgens are utilized for their pharmacologic actions, recommendation must be withheld. These matters require further and critical study. It is probable that in conditions in which the use of testosterone may, perhaps, eventually be acceptable, no sweeping utility is to be expected; for example, only a selected type of muscular weakness would be benefited.

LIMITATIONS, CONTRAINDICATIONS AND DANGERS

The foregoing list of phenomena influenced in sundry manners by androgens is limited by space and by the boundaries of present knowledge, but it serves to indicate the widely ramifying influence of these substances on bodily economy and to give sober reflection to the physician who might feel constrained to use carelessly the active and valuable androgens now available.

The use of large doses in a child can result in closure of the epiphyses and in development of male secondary sexual characters. In the sexually mature person exogenous androgen depresses reproductive functions, such as spermatogenesis⁴² and gonadotropic secretion in the pituitary.⁴⁶

If large doses are employed in women, masculinization results. This includes hirsutism, hoarseness and deepening of the voice, interruption of reproductive function and growth of the clitoris and of the body musculature. These changes seem to be largely temporary, but permanent modification is obtained experimentally if the female is subjected to the influence of much androgen at an early age, especially prenatally.⁴⁷

The temporary use of endocrine preparations does not stimulate an endocrine gland to function thereafter of its own accord. Testosterone is used in replacement therapy or for its pharmacologic actions. Treatment is often long continued, and the cost of the therapy is a major consideration.

There is latent danger in that conditions which need immediate attention of a specialized nature may be allowed to continue untreated because the patient experiences a sense of well-being on receiving testosterone. Moreover, euphoria is not uncommon and should be guarded against by strict insurance that the patient gets rest and does not overexert. Stimulation of an older man with androgens may cause him to feel younger and to attempt to lead the life of a younger man. The situation is to some extent like that of pouring new wine into old bottles.

CORSETS AND BACKACHE

FRANK R. OBER, M.D.

BOSTON

This article is intended to bring up to date one published thirty years ago by Reynolds and Lovett¹ entitled "An Experimental Study of Certain Phases of Chronic Backache." The observations made on corsets by those men at that time were so fundamental that it would seem appropriate to present them again in a reedited form. The authors spent a long time in the experimental study of physics of statics, and of balance and fatigue as related to statics.

Numerous living models were employed and all sorts of corsets were used, and the following conclusion with respect to corsets was arrived at: "In their effects on the anteroposterior position of the body, corsets may be divided into three classes—neutral, bad and good corsets."

It is probably safe to say that all women wore corsets thirty years ago, but today the number is much less. As a matter of fact, it is more difficult to induce a woman suffering with backache to wear a corset than it is to induce a man to do so. Neutral and bad corsets are still being manufactured and sold.

Neutral Corsets.—These corsets were found to be worn more often than any other type. Many of them had bad effects on posture and balance and but few were beneficial, and most ready-made corsets at best were found to be indifferent.

Bad Corsets.—Bad corsets could produce static backache. All of these had three common characteristics:

1. They were too long behind and too short in front.
2. They were cut to exert the greatest pressure at the top and bottom behind, and at the waist line in front, especially.
3. The sacral curves were strongly marked but otherwise they did not follow the rest of the anatomy of the back.

Good Corsets.—

1. They were short behind and long in front, especially at the bottom.
2. They fitted snugly around the pelvis, especially between the iliac crests and the trochanters.
3. They were "incurved" at the waist line at the back and showed no curve in front.

Reynolds and Lovett made their observations over a period of years before publishing the results of their study. These fundamental principles are as true today as they were thirty years ago.

A corset which does not fit the patient properly will not help a lame back; on the contrary, such a garment may increase backache.

A corsetier's job is much like that of a sailmaker's. If the sails are not cut correctly, they do not draw right and hence the boat will not sail as fast as it should.

There is a real art to cutting sails, and the same is true in the cutting of cloth for corsets.

The functions of a corset are to restrict motion, to afford protection and to restore balance. Any back support which does not accomplish these three things will not do much toward relieving a backache. The physician who cares for patients suffering from lame back has not done all he can when he turns the patient over to the corset maker. The physician should be the one to know whether a corset fits properly or not, and, if it does not, he should see to it that the corsetier makes the necessary alterations until it does fit. A tailor-made corset is the best if the corsetier is adept at making corsets. A ready-made corset of the good type can be remodeled and in most instances is satisfactory, provided the corset fitter does what the physician wants.

The following requirements are essential in applying a corset:

1. It should be long enough in front to support and to lift the abdomen.
2. It should follow the curves of the back snugly; that is, the back steels of the corset must be bent so that this occurs.
3. It should be long enough behind to give a good hold over the buttocks, and it should not quite reach the inferior angles of the scapulas.
4. It should not be tight around the waist in front.
5. The most important feature of any corset is the way it fits over the iliac crests. Few corset makers realize how essential it is to secure this requirement. It is here that the knowledge and art of the corset maker will be revealed. Unless the corset maker learns to do this, the corset will not be a success. The cloth of this part of the corset must be so cut that the crest of the ilium fits into a sort of pocket. If this is not done, then the corset will slide up or roll backward over the crests and therefore will be useless.
6. If a corset is effective it will produce changes in the patient's posture. For this reason it is necessary to inspect the corset from time to time and make any necessary alterations to meet these changes.
7. A back-lace corset is more easily adjusted than the solid back garment.
8. Corsets which are constructed with sacral pads inside or extra belts outside are examples of lack of knowledge on the part of the corsetier in the correct construction of a corset.
9. Any corset or belt which encircles the pelvis as if it were in a vise is an undesirable piece of apparatus, because pressure usually does not relieve a lame back.
10. Finally, when the backache and its associated symptoms have disappeared, physical therapy measures to restore the patient's own corset muscles, which are the abdominal and the gluteus maximus muscles, should be prescribed, and, when these muscles are strong enough to perform their functions, the corset may be omitted.

234 Marlboro Street.

Rest Clubs.—The time may come when we shall have rest clubs as well as athletic clubs; but not yet. We are still too much inclined to boast of the small amount of rest on which we can get along. We still cling to the mad desire to get everything done in a day. To entice the average American to rest in the daytime one must camouflage the rest with mysterious measures such as light treatments, massage or sun bathing. Possibly when as a nation we have grown up we shall learn to take life more leisurely, to get a little more out of life as we go along, with a friendly chat and a cup of tea to break the tension of the day.—Diehl, Harold S.: *Healthful Living*, New York, McGraw-Hill Book Company, Inc., 1941.

DOCTORS FOR BRITAIN

To the American Red Cross last week came an appeal from the British Red Cross for one thousand American doctors to reinforce the staffs of the Emergency Medical Service and the Royal Army Medical Corps. The American Red Cross is presenting this appeal to the medical profession. Applicants will undertake no obligation to enter military or naval service, but if they choose service in the Royal Army Medical Corps their duties will be confined to the furnishing of medical attention to the sick and wounded. In this service they will be protected by the Red Cross Treaty of Geneva, respected by all belligerents, under which members of medical units are granted special privileges and protection.

On receipt of this communication, the President of the United States said:

The British Red Cross has appealed through the American Red Cross for up to one thousand young American doctors to help it meet an acute shortage of doctors in British military and civilian hospitals. As President of the American Red Cross, I heartily approve this request. When the British appeal came to my attention, I asked the opinions of the surgeon generals of the Army, Navy and Public Health Service. They joined me in believing we should encourage eligible American doctors to volunteer for this humanitarian service with our British friends. I also am informed that the Division of Medical Sciences of the National Research Council, the American Medical Association, the American College of Surgeons and the American College of Physicians have offered their assistance to the American Red Cross in meeting this emergency. The young doctors whom Great Britain so desperately needs can do much to heal the wounds inflicted alike upon civilians and military in this cruel war. Those who volunteer will be enrolled by the British Red Cross and will work under the protection of the Red Cross Treaty of Geneva, a covenant which has been respected by the belligerents since 1864. To any American doctor who is eligible and able to go, service in this cause presents a splendid opportunity.

So pressing is the need for these volunteer physicians that the support of interested governmental agencies has been freely given. The Departments of State and Justice have clarified the legal aspects of the project, giving it their full support. The Army, the Navy and

the U. S. Public Health Service have endorsed the appeal. The Surgeon Generals of the Army and the Navy have consented to the offering of this opportunity to physicians in their respective Reserve Corps who have not yet been called to active duty. The Selective Service System will give consideration to the deferment of those who volunteer.

The officials of the American Red Cross have been assured that the American Medical Association will lend every possible assistance to them in their endeavor to meet this request, which has come officially from the British Red Cross. Through the use of the punch card system of the American Medical Association, which lists the qualifications of American physicians, the American Red Cross has been supplied with lists of young physicians who may be eligible for service under this program.

The requirements for these positions, as stated elsewhere under the heading "Medical Preparedness" in this issue of THE JOURNAL, are somewhat rigorous: The physician must be a citizen of the United States of America, preferably without persons dependent on him for a livelihood; he must be no more than 40 years of age for service in the Royal Army Medical Corps, not more than 45 for the Emergency Medical Service; he must have a diploma from an American or Canadian medical school listed as class A by the Council on Medical Education and Hospitals of the American Medical Association; he must have had an internship, and he must be in good mental and bodily health and free from any physical defect that would be likely to interfere with his duties. The young man who is enrolled for this service will not forfeit his American citizenship, and he will not be required to take an oath of allegiance to Great Britain.

In April 1917 the United States government tendered to Great Britain one thousand medical officers. Great numbers of patriotic young men volunteered and more than thirteen hundred were selected to fill the quota. The records of those young men are available in a book by W. A. R. Chapin. Now, twenty-four years later, it is inspiring to look over the names of those men and to realize how many of them occupy positions of significance in American medicine. Now again comes a call for volunteers—for young physicians anxious to serve in their professional capacities in a service that will yield practice and prestige in the cause of patriotism. Such aid as they can give is more than the lending of funds or the leasing of ships. It is a human and professional devotion of themselves to democracy.

Eligible physicians should secure further details and application forms from the American Red Cross in Washington. The Division of Medical Sciences of the National Research Council has established a special Subcommittee on Medical Personnel for Britain, which will aid in passing on the qualifications of those who apply. This committee consists of Dr. O. H. Perry

Pepper, past president of the American College of Physicians, Chairman; Dr. Morris Fishbein, Editor of THE JOURNAL, and Dr. Evarts A. Graham, president of the American College of Surgeons. The Committee on Medical Preparedness of the American Medical Association is aiding with the selection of local representatives and local examiners. American medicine cannot fail to answer again this call for a service which only American medicine as a whole can render.

LUNG IRRITATION FOLLOWING THE USE OF CERTAIN OILY PREPARATIONS

Recently THE JOURNAL published a report by Cannon,¹ issued under the auspices of the Council on Pharmacy and Chemistry, on the problem of lipid pneumonia, or what is frequently called "lipoid" or oil aspiration pneumonia. This type of pneumonia varies in severity, depending on the kind and amount of oil aspirated, since some oils are especially irritating. The concomitant entrance into the lungs of the irritating oil and pathogenic micro-organisms is presumably responsible for the particularly serious septic pneumonia which may follow aspiration of oil. In other instances, particularly where only small amounts of liquid petrolatum have been aspirated, minimal pulmonary damage occurs with correspondingly slight symptoms. However, harmful effects may also result from repeated entrance of oil into the lungs, its accumulation in the air spaces and its prolonged irritating effect. The development of this form of lipid pneumonia is so insidious that the diagnosis may be made only by microscopic examination of the lungs.

Contrary to earlier views that lipid pneumonia is essentially a disease of infants and children, or of debilitated persons with defects of deglutition, evidence has accumulated to prove that it affects all ages. Indeed, most of the cases discovered at necropsy are reported to have occurred in adults. Healthy persons may develop severe types of lipid pneumonia, especially from the prolonged intranasal use of medicated liquid petrolatum. The use of medicated liquid petrolatum in medical practice or for home medication, while a more easily controlled cause of oil aspiration, is of particular importance. The extensive advertising to the public by manufacturers of "nasal oils" for "colds" indicates the need for warning. Moreover, this type of medication is abandoned but slowly by many persons who have used oily nose drops without apparent ill effects. The choice of liquid petrolatum as a "bland" vehicle for various medicaments used in the treatment of infections of the respiratory tract is particularly unfortunate because it is sufficiently light to enter the glottis without eliciting the cough reflex; then it is either aspirated or gravitates

to the alveolar spaces. Many animal oils, particularly fish liver oils, are highly irritating to the respiratory tissues, whereas some of the vegetable oils, such as olive oil, cottonseed oil, sesame oil and poppyseed oil, are relatively less irritating. The use of iodized oils in bronchography has apparently had little serious after-effects in the lungs. Several of the vegetable oils, notably croton oil, castor oil and peanut oil, are exceedingly active irritants of tissues. Liquid petrolatum, although less acutely damaging than the oils mentioned, is far from bland. Acute pulmonary edema has followed aspiration experimentally in rabbits. Its chronic effects in the lungs are particularly severe owing to the development of abundant fibrosis. In a previous report² the Council indicated that some types of iodized oils, especially the animal oils, may cause considerable direct irritation when used for bronchography.

The insidious nature of onset of the chronic form of lipid pneumonia, especially that due to liquid petrolatum, indicates the importance of differentiating the disease from other more or less obscure pulmonary conditions, such as pneumoconiosis, chronic bronchitis or bronchiectasis, chronic asthma, passive congestion, unresolved pneumonia, chronic fibroid tuberculosis, fungous infections of the lungs and bronchogenic carcinoma. Careful clinical diagnosis is important not only from the point of view of errors in treatment but also in assisting in future evaluations of the incidence of the disease. From evidence available at present the incidence of lipid pneumonia cannot be ascertained. The future recognition of the condition depends not only on careful clinical diagnosis but also on the efforts of the pathologist to perform systematic routine histopathologic examinations of the lungs in every necropsy. Other reports by Bishop³ and Kirklin,⁴ not cited in the Council report, further attest the increasing importance of the disease.

As indicated in the Council report, lipid pneumonia is essentially a man-made disease, which can be prevented largely by the extent to which the conditions now known to favor its development are eliminated. Greater care to avoid forced feeding of milk and of fish liver oils and liquid petrolatum to infants as well as to comatose patients may help to prevent this type of pneumonia. The problem of prevention of cases due to intranasal medication with nasal oils is more hopeful and should stimulate a reconsideration of the rationale of local medication of the upper respiratory tract. The use of a physiologic aqueous solution as a vehicle for medicaments instead of liquid petrolatum appears to offer a preferable alternative in the local treatment of the upper respiratory tract. The medical

profession can take the leadership in the educational campaign to eliminate the widespread practice of self medication with nasal oils by the public.

THE JOURNAL⁵ as well as the Council on Pharmacy and Chemistry has previously warned against the danger of "lipoid" pneumonia following the oral or intranasal use of liquid petrolatum and other oils.

Current Comment

MEDICAL SERVICES RECEIVED

The United States Public Health Service continues its series of additional analyses of earlier studies with one describing the receipt of medical services as shown by the National Health Survey.¹ The conclusions really have little novelty. They show that:

1. The percentage of illnesses which received medical attention varied markedly with income and also with size of city for the same income group.

2. The amount of care per patient treated by a doctor in the lower economic status groups (especially the relief) was below the averages for the higher income group.

3. The percentage hospitalized of those with disabling illnesses was less in the lower incomes and relief groups.

4. Bedside nursing care by a private duty nurse was received for only a small proportion of illnesses in relief families, the percentages rising rapidly with increasing income. The reverse was true in the case of services by a visiting nurse.

5. The percentage of illnesses receiving medical care was at a maximum in the age group 25-64 and at a minimum in childhood. . . . Services per case reflected particularly the increasing severity of the individual case of illness as age advanced.

6. The amount and type of medical care received varied with the nature of the disease, the proportion of disabling illnesses not receiving care varying from about 38 per cent for communicable diseases, colds, influenza, and so on to about 6 per cent for tonsillitis (largely tonsillectomies), diseases of the digestive system, accidents and degenerative diseases.

7. There was a relative lack of private duty nursing and hospital care among the Negro population, especially in the smaller cities in the South, and a greater proportion of Negroes received care in public clinics and from visiting nurses.

There is nothing especially new about the fact that in a society with wide income differences the amount and quality of the medical service as well as of education, amusement and especially of such necessities as food, clothing and shelter vary according to income. The difference, however, is apparently far less for medical service than for any of the other essentials of life. Those on relief and having an annual income of less than \$1,000 received physicians' care in 78 per cent of their illnesses, while the percentage for those with an annual income of over \$5,000 was 89. When the character of the diseases treated is considered it is found that the widest difference in the percentage of persons receiving medical care in the income extremes was 20 per cent for communicable diseases, 18 per cent for colds and influenza and 11 per cent for rheumatism. While statistics do not exist by which to make

a comparison with earlier years, all evidence available would indicate that the medical service received today is much greater in quantity and infinitely better in quality than at any previous period and that it is continuously improving.

"DRUG-FAST" PNEUMOCOCCI

Schmidt, Clausus and Starks,¹ of the University of Cincinnati, have reported that pneumococci isolated from animals inadequately treated with sulfapyridine not only have an acquired resistance to sulfapyridine but also are equally resistant to other sulfonamide derivatives. The development of sulfapyridine "fastness" was first described by MacLeod and Daddi,² who found that pneumococci grown in increasing concentrations of sulfapyridine will finally multiply freely in one hundred times the usual sterilizing concentration of this drug. Mice inoculated with these artificially "accustomed" pneumococci are not cured by multiple therapeutic doses of sulfapyridine. This drug-fastness is of clinical interest. Neter³ found that 0.5 mg. per hundred cubic centimeters of sulfapyridine added to pneumococcic empyemic fluids will usually sterilize these fluids in the earlier clinical stages of the disease. Subsequent specimens from the same patients, however, after routine sulfapyridine therapy, are almost invariably resistant to sulfonamide sterilization, even when the sulfapyridine concentration is increased one hundred fold (i. e. to 50 mg. per hundred cubic centimeters). Successful chemotherapy of such empyemic cases apparently necessitates the finding of a second drug to which these drug-fast pneumococci are susceptible. Schmidt and his co-workers attempted to find such a supplementary therapeutic agent among other sulfonamide derivatives of current interest. These attempts were unsuccessful. Groups of 100 mice each were inoculated with multilethal doses of sulfapyridine-fast strains of pneumococci, with control groups inoculated with the nonfast parent strains of the same cultures. All untreated mice of each group died in from twenty-seven to one hundred and forty-four hours from pneumococcic infection. With the control nonfast parent strains this 100 per cent mortality was reduced to 17 per cent by routine treatment with sulfathiazole, to 13 per cent with sulfamethylthiazole and to 10 per cent with sulfapyridine. With groups inoculated with the drug-fast strains, the mortality was 100 per cent in spite of such treatment. Sulfapyridine-"fast" pneumococci, therefore, are apparently equally resistant to sulfathiazole and sulfamethylthiazole. In his original communication MacLeod⁴ suggested that "sulfapyridine-fast" strains of pneumococci should be treated with type-specific antisera. Whether or not these triple drug-fast strains are susceptible to specific serum therapy has not yet been tested by the Cincinnati biochemists.

MEDICAL PREPAREDNESS

In this section of *The Journal* each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

PHYSICIANS REQUESTED FOR SERVICE IN GREAT BRITAIN

Following is information supplied by the American Red Cross for physicians who will consider service with the Royal Army Medical Corps or the British Emergency Medical Service. Application forms and further details may be secured from the American Red Cross, Washington, D. C. The fundamental qualifications are as follows:

The applicant:

1. Must be a citizen of the United States of America.
2. Must be no more than 40 years of age for service in the Royal Army Medical Corps and no more than 45 years of age for service in the Emergency Medical Service.
3. Must hold a diploma from an American or Canadian medical school of class A standing. The professional qualifications of the applicant will be passed on by a subcommittee named by the Division of Medical Sciences, National Research Council, working in collaboration with the American Medical Association, the American College of Surgeons and the American College of Physicians.
4. Must have had at least one year of satisfactory clinical hospital training in a hospital registered by the American Medical Association. For the Emergency Medical Service candidates must have been in practice at least five years and not more than ten years.
5. Must be in good mental and bodily health and free from any physical defect likely to interfere with his duties. The physical qualifications of the applicant will be determined at a physical examination to be made when and where the applicant is instructed to appear for it. Travel expenses for the visit to the medical examiner will be paid by American Red Cross.
6. Must be eligible for a British visa.

The applicant, if accepted, is not to be enrolled as a soldier or sailor but solely for the performance of medical service.

Accepted applicants will be referred by the American Red Cross to the British Red Cross or its representatives for the details of transportation and entrance into service.

INFORMATION CONCERNING SERVICE WITH THE ROYAL ARMY MEDICAL CORPS

1. Candidates accepted will be eligible for appointment to commissions in the Royal Army Medical Corps.

2. *Retention of American Citizenship.*—An applicant appointed to the Royal Army Medical Corps will not forfeit his American citizenship, since he will not take an oath of allegiance. However, if an American citizen accepting service with the Royal Army Medical Corps should be at the same time a British subject, i. e. have dual nationality, he would lose his American citizenship.

3. *Status Under Selective Service Act.*—Arrangements have been made with the National Headquarters of the Selective Service System whereby consideration will be given to the deferment of those selected under this program, and the granting to them of permission to leave the country.

4. *Rank in Royal Army Medical Corps.*—Appointment to commission and pay will date from embarkation. The first

commission of the approved applicant will be in the rank of Lieutenant, with promotion to rank of Captain after twelve months of satisfactory full pay service. Subsequent promotion will be by selection and will be based on general merit.

5. *Tenure of Service.*—The minimum tenure of service in each instance is one year from the date of embarkation. The contract will be renewable each successive year. Accepted applicants may also volunteer for the duration of the war.

6. *Transportation To and From Duty.*—The candidate accepted will receive free transportation from his home in the United States of America to the point of duty. Instructions for transportation will be issued through the agency of the American Red Cross. On termination of service the officer will be granted free transport to a selected place of residence in the United States of America.

7. *Passport.*—On acceptance of the candidate as eligible (see Requirements) he will be certified to the Department of State. The accepted applicant will then make application himself to the Department of State for a passport.

8. *Pay and Allowances.*—(a) Basic Pay. Candidates will receive the British rates of pay and allowances in the Royal Army Medical Corps. The following rates of pay are applicable:

Rank	Daily Rate			Approximate Equivalent Annual Rate in Dollars Calculated at the Present Rate of \$4.025 to the Pound
	£	s.	d.	
Lieutenant	0.	19.	10.	\$1,456.50
Captain	1.	4.	6.	1,800.00

At the end of each year of satisfactory service they will receive a gratuity at the following rates:

		Approximate Dollar Equivalent
Lieutenant	£100	\$402.50
Captain	£150	603.75

If promoted during the course of a year to higher paid rank than Lieutenant the gratuity will be calculated according to the length of service in each rank. These gratuities will be paid in sterling. No gratuity will be payable for any period during which paid rank above that of Captain is held.

Total remuneration for each rank is substantially the same as for the corresponding rank in the United States Army Medical Corps.

Pay and gratuity are subject to British income tax, but this liability will, as a special case, be met by the British War Office, except that

		Approximate Dollar Equivalent
A lieutenant will be liable to pay....	£10.10.0d. a year	\$ 42.26
A captain will be liable to pay.....	£16. 0.0d. a year	64.40
A major will be liable to pay.....	£17. 0.0d. a year	68.42
A lieutenant colonel will be liable to pay	£30. 0.0d. a year	120.75
A colonel will be liable to pay.....	£38. 0.0d. a year	152.95

representing approximately the tax payable on a corresponding income at American rates. The amount payable will be deducted by monthly instalments. Neither basic pay nor gratuity is subject to United States income tax.

(b) Allowances. They will receive an outfit grant of £30 and a further £10 if and when required to purchase tropical

kit. An officer receives rations and accommodation (lodging, fuel and light) in kind, but when these are not provided cash allowances in lieu are issued.

9. *Remittances to the United States.*—Because of the problems involved in pound-dollar exchange, it is difficult, if not impossible, to transfer funds at the present time to dependents residing in the United States.

10. *Compensation for Injuries and Disabilities Attributable to Military Service.*—American officers will be eligible for the same disability compensation as other officers of the Royal Army Medical Corps in the event of disablement or death. Regulations and conditions governing the issue of such compensation, which also apply to certain dependents, are as laid down in the Ministry of Pensions Warrant (current edition) Cmd. 6205 articles 18, 64 and 65. Copies of these articles will be forwarded on request.

11. *Duties.*—An officer of the Royal Army Medical Corps is liable for service in any place where British troops are located or operating. This means, in general terms, Europe, Africa, Asia. At present the more important stations are Egypt, Palestine, India, Burmah, Malaya, China, East and West Africa. The wishes of officers who prefer service in a particular country or countries will be considered and, so far as possible, met, but such an appointment cannot be guaranteed. (See Question 15 in application form.)

All such volunteers must realize that they are liable to serve as medical officers in charge of the native troops of these countries when ordered by the director of medical services therein. Volunteers for India must realize that it is an integral part of their duty to serve under Indian medical officers when so ordered by the Director of Medical Services, India. Any candidate sent to India will therefore be made fully aware of this obligation of service in that country.

The duties required of applicants are those of the general practitioner of medicine. It should be stressed that trained surgeons and other medical specialists are not at present required. As designated, the applicant may serve as medical officer attached to a regimental unit wherever it may be; in the field or not on active operations. He may be employed in military medical units which deal with casualties after they have passed from the care of the regimental officer. These medical units are:

- (a) The field ambulance.
- (b) The motor ambulance convoy.
- (c) The casualty clearing station.
- (d) The ambulance (railroad) train.
- (e) The general hospital.
- (f) The convalescent depot.
- (g) The hospital ship.
- (h) Static formations (service with stationary troops, such as antiaircraft formations).

INFORMATION CONCERNING SERVICE WITH THE BRITISH EMERGENCY MEDICAL SERVICE

1. *The Emergency Medical Service.*—A number of accepted candidates will be eligible for appointment to the British Emergency Medical Service, controlled by the British Ministry of Health and the Department of Health for Scotland. The applicant may choose appointment in the Emergency Medical Service. (See Question 15 in application form.)

2. The requirements for eligibility are the same as for service in the Royal Army Medical Corps, except that candidates (a) must have been in practice at least five years and not more than ten years;

(b) must not be more than 45 years of age.

3. *Tenure of Service and Duties.*—Candidates appointed would be required to sign a contract for whole time employment for one year in the first instance at any hospital in Great Britain which is included in the Emergency Hospital Scheme. Candidates may express a choice for location of service which will be given consideration. The scheme comprises practically all general hospitals in Great Britain whether "voluntary" (private) or "municipal" (public) and provides for the hospital treatment of air raid casualties (whether service or civilian), other service casualties and service sick requiring hospital treatment in Great Britain and a number of special categories

of civilian sick for the treatment of which the British government has undertaken financial responsibility for the duration of the war. Details are shown on the attached specimen letter offering enrolment, acceptance of which constitutes a contract of employment between a member of the service and the minister. (Note specimen letter in Appendix I.) It may be added that the hospitals in the scheme continue to treat the ordinary civilian sick, acute as well as chronic, so that members of the Emergency Medical Service have an opportunity of observing and, so far as their Emergency Medical Service duties permit taking part in, the ordinary work of the hospitals to which they are posted.

4. *Pay.*—Candidates accepted for the Emergency Medical Service will receive the same rates of pay as British subjects, namely, £550 a year (approximately 2,213.75 American dollars as calculated at the present rate of exchange) with full board and lodging, or an allowance of £100 a year (approximately 402.50 American dollars) where board and lodging is not provided. Income tax, although chargeable at ordinary British rates, will be paid by the British Ministry of Health or by the Department of Health for Scotland, but the officer will be liable to pay a sum representing tax at United States rates (£14 a year, or approximately 56.35 American dollars), deducted on a monthly basis. Neither basic pay nor gratuity is subject to United States income tax. Salary is payable from the date of embarkation.

5. *Remittances to the United States.*—Because of the problems involved in pound-dollar exchange, it is difficult, if not impossible, to transfer funds at the present time to dependents residing in the United States.

6. *Civilian Status.*—Members of the Emergency Medical Services are civilians and do not wear a uniform or receive an outfit grant. A brassard denoting membership in the service is supplied.

The question of loss of American citizenship does not arise, since the candidate would be employed in a civilian status.

7. *Status Under Selective Service Act.*—Arrangements have been made with the National Headquarters of the Selective Service System whereby consideration will be given to the deferment of those selected under this program and the granting to them of permission to leave the country.

8. Transportation and passport arrangements and expenses are identical with those in the case of the Royal Army Medical Corps officer.

9. *Compensation for Injuries and Disabilities Incurred in the Emergency Medical Service.*—Members of the Emergency Medical Service who are injured or killed (a) in the course of their employment or (b) as a result of enemy action otherwise than in the course of their employment will be eligible for the compensation payments provided for British subjects under the Personal Injuries (civilians) Scheme.

APPENDIX I. SPECIMEN LETTER OFFERING ENROL- MENT IN THE BRITISH EMERGENCY MEDICAL SERVICE

Form E. M. S. P. 47
MINISTRY OF HEALTH,
WHITEHALL,
LONDON, S. W. 1.
R. A.
March 1941.

ESTAB. E. M. S.
Class I. (U. S. A.).

Sir,

Emergency Medical Service.
Class I Appointments

I am directed by the Minister of Health to inform you that the Emergency Medical Service under his control includes a number of Medical Officers holding whole-time appointments. Although employed and paid by the Ministry, they work under the general administrative control of the governing body of the hospital where they are stationed and their clinical work is not directed by the Ministry. The conditions on which officers who are United States citizens, selected under arrangements made by the American Red Cross and approved by the Minister, are appointed to this Service are as follows:

(1) An Officer is under an obligation to serve in the first instance for a period of twelve months, which will be reckoned from the date of sailing from a United States port for this country, and, subject to approved service, the Minister guarantees him employment for that period. Unless twenty-eight days prior notice is given by the Minister or by the officer, terminating the employment as at the end of that period, the employment will continue on the same terms and conditions, subject to termination at any time on the giving of twenty-eight days previous notice in writing either by the Minister or by the officer.

(2) An Officer should report for duty to the Director-General Emergency Medical Services, Ministry of Health, Whitehall, S. W. 1. (R. A.) as soon as reasonably practicable after landing in this country.

(3) During his period of service an officer is subject to all the rules and entitled to all the privileges applying generally to temporary officers in His Majesty's Civil Service.

(4) Officers enrolled in the Emergency Medical Service may be required to undertake cases in any of the categories for which the Government has undertaken financial responsibility as part of the Emergency Hospital Scheme. These categories at present include the following:

(i) Civilians (including Civil Defense Volunteers and members of the Home Guard) injured by enemy action or in the course of civil defense or Home Guard duties, whether transferred from another hospital or admitted at first instance.

(ii) Officers and other ranks of the Fighting Services (including women's auxiliaries) injured by enemy action or on duty or sick, whether transferred from another hospital or admitted at first instance.

(iii) Members of Dominion or Allied Forces.

(iv) Prisoners of war and interned enemy aliens.

(v) Foreign refugees prior to dispersal to permanent accommodation.

(vi) Sick civilians transferred from other hospitals under the authority of the Minister's Hospital Officers or Group Officers in order to clear casualty beds or in connection with war operations.

(vii) Sick children evacuated under the Government Scheme and not accompanied by an adult relative.

(viii) Transferred Essential War Workers.

(5) Whole-time officers, so far as they are not fully occupied with attendance on the categories referred to in the previous paragraph, are expected to assist generally with the medical work of the hospital to which they are attached, as may be directed by the Medical Superintendent or other Medical Officer in charge.

I am to offer you an appointment on the conditions set out in this letter and to request you to fill in and return the enclosed E. M. S. P. 47A form if you decide to accept the appointment.

If you accept the appointment you will be employed in the first instance as a at a salary at the rate of £550 a year with an allowance at the rate of £100 a year if you are not supplied with board and lodging. Salary is payable from the date of sailing from a United States port, and income tax, although chargeable at ordinary British rates, will be paid by the Ministry, but you will be charged a sum representing tax at the United States rates.

Officers enrolled in the Service are provided with free transportation from their homes and will be repatriated at the termination of their service to their selected places of residence in the United States.

I am, Sir,

Your obedient Servant,

Director of Establishments.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY WAR DEPARTMENT

The following additional medical reserve corps officers have been ordered to active duty by the War Department:

BAISINGER, Cecil Francis, 1st Lieut., Pasadena, Calif.
BARNER, John Lemuel, 1st Lieut., Des Moines, Iowa.
BARRETT, Ralph Michael S., Captain, St. Louis.
BOLTON, Wilbur M., Major, Cleveland.
BROWN, William, 1st Lieut., Long Island City, N. Y.
COMPTON, Arthur M., 1st Lieut., Portland, Ore.
CORR, William Philip, Major, Riverside, Calif.
CUSTER, Lawrence Reid, Captain, San Francisco.
DAY, Boston Massachusetts, 1st Lieut., San Francisco.
DUNLAP, Harold Jay, 1st Lieut., New Rochelle, N. Y.
DUNSTAN, Edgar Mullins, Major, Dallas, Texas.
FRANK, Samuel Bergman, Captain, New York.
FRANKS, Andrew George, Captain, New York.
GOERING, William H., Captain, Tacoma, Wash.
GOLDEN, Theodore, Captain, New York.
GRAY, Luther Wilson, Captain, Washington, D. C.
HAWKINS, Benjamin L., 1st Lieut., Cincinnati.
HERMANN, Harold Bernard, 1st Lieut., Brooklyn.
JACOBS, Maurice, 1st Lieut., Dorchester, Mass.
LIEBOW, Irving Maxwell, 1st Lieut., Cleveland.
MALCOLM, Donald Claude, Captain, Chicago.
MARRUT, William Martin, 1st Lieut., Hermiston, Ore.
MARKEY, Leo Robert, Major, Cleveland.
McDONNELL, Thomas J., 1st Lieut., Dunmore, Pa.

MORSE, Stanley Fletcher, Jr., 1st Lieut., Sumter, S. C.
MUDD, Richard Dyer, Major, Saginaw, Mich.
MUELLER, Lawrence William, 1st Lieut., Fort Wayne, Ind.
MURBACH, Clarence Franklin, Major, Archbold, Ohio.
NORFLEET, William Jacob, Major, Shreveport, La.
O'CONNOR, Timothy Francis, Captain, Ashtabula, Ohio.
PENHALLOW, Dunlap Pearce, Colonel, Washington, D. C.
RICHARDSON, Fred MacDonald, 1st Lieut., Philadelphia.
SAMSON, Paul Curkeet, 1st Lieut., Oakland, Calif.
SCHRAM, William Saul, 1st Lieut., Newark, N. J.
SCHWARTZ, Herbert Franklin, 1st Lieut., Koch, Mo.
WEITZ, Martin Lester, Captain, Laurelton, N. Y.
WELLMAN, John Morris, 1st Lieut., Lansing, Mich.

CORRECTION

James Marion Crawford.—This name was erroneously published among the medical reserve officers ordered to active military duty in THE JOURNAL, Nov. 30, 1940, page 1892. The name was confused with that of James Marvin Crawford, who is not a physician but is on duty with District E of the CCC Camp at McComb, Miss. Dr. James Marion Crawford is now serving as a first lieutenant in the medical reserve corps at Tuscaloosa, Ala.

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

ASHER, Leonard M., 1st Lieut., Boston, Fort Devens, Mass.
BELLIOTTI, Joseph L., Lieut. Col., Providence, R. I., Fort Banks, Mass.
BRUCE, James G., Captain, Springfield, Mass., Fort Ethan Allen, Vt.
COGSWELL, Thomas G., 1st Lieut., Worcester, Mass., Fort Devens, Mass.
COOK, Aaron, Captain, Waterville, Me., Fort Devens, Mass.
COTTON, John M., Captain, Hartford, Conn., Fort Banks, Mass.
EMMONS, James E., Captain, Newport, Vt., Fort Ethan Allen, Vt.
FAY, Thomas F., 1st Lieut., Augusta, Me., Fort Williams, Me.
FEELEY, John R., 1st Lieut., Bangor, Me., Fort Williams, Me.
FOGG, Alston L., Major, Burlington, Vt., Camp Edwards, Mass.
GLADSTONE, Robert W., 1st Lieut., Pittsfield, Mass., Camp Edwards, Mass.
GLICK, Harry S., 1st Lieut., Leominster, Mass., Fort Banks, Mass.
GOODMAN, Melvin O., 1st Lieut., Manchester, N. H., Manchester, N. H.
GOULD, George I., 1st Lieut., Biddeford, Me., Fort Devens, Mass.
GOULD, Nathaniel, 1st Lieut., Barnet, Vt., Camp Edwards, Mass.

THIRD CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Third Corps Area, which comprises the states of Pennsylvania, Virginia, District of Columbia and Maryland:

BRENNAN, Andrew Joseph, Captain, Birdsboro, Pa., Fort Monroe, Va.
BUTLER, Harry Gains, Major, Owings Mills, Md., Fort George G. Meade, Md.
EINHORN, Nathan Harry, 1st Lieut., Philadelphia, Indiantown Gap Military Reservation, Indiantown Gap, Pa.

HARDY, Wilbert C., Lieut. Col., Haverhill, Mass., Fort Adams, R. I.
HASCALL, Theodore C., Major, Riverside, R. I., Fort Rodman, Mass.
HUSSEY, Earle U., Captain, Lynn, Mass., Camp Edwards, Mass.
JARDINE, Ralph R., 1st Lieut., Lyndonville, Vt., Fort Williams, Me.
KEES, Philip Arzt, Captain, Longmeadow, Mass., Camp Edwards, Mass.
KNEPP, James W., Lieut. Col., Bridgeport, Conn., Fort Devens, Mass.
LEANI, Aldo, 1st Lieut., Barre, Vt., Camp Edwards, Mass.
MARBLE, Alexander, Captain, Boston, Camp Edwards, Mass.
MEDALIA, Leon S., Lieut. Col., Boston, Fort Devens, Mass.
MEUNIER, John L., 1st Lieut., Springfield, Vt., Camp Edwards, Mass.
MILLER, Harry B., 1st Lieut., New Britain, Conn., Fort Devens, Mass.
NEVULIS, Anthony V., 1st Lieut., New Britain, Conn., Fort Banks, Mass.
OLANS, Sidney, 1st Lieut., Somerville, Mass., Fort Devens, Mass.
RAFFERTY, Francis B., 1st Lieut., Williamantic, Conn., Camp Edwards, Mass.
ROBBINS, Albert I., 1st Lieut., Roxbury, Mass., Fort Devens, Mass.
SAIA, John L., 1st Lieut., Barre, Vt., Fort Rodman, Mass.
SHUMAN, Hyman Herman, 1st Lieut., Fitchburg, Mass., Fort Devens, Mass.
SKLAVER, Joseph, 1st Lieut., Waterbury, Conn., Fort Adams, R. I.
SULLIVAN, Charles R., 1st Lieut., Pittsfield, Mass., Fort Banks, Mass.
TYLEC, Leo L., 1st Lieut., Union City, Conn., Camp Edwards, Mass.
WEBBER, Wedgwood P., 1st Lieut., Lewiston, Me., Fort Williams, Me.
WELLS, Guy W., Captain, Providence, R. I., Fort Adams, R. I.
WILSON, Walter E., Jr., 1st Lieut., Rye, N. H., Fort Devens, Mass.

GARVIN, Luke Denis, 1st Lieut., Bradford, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
GRIBOVSKY, Emile, 1st Lieut., Kingston, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
HAND, Patrick James, 1st Lieut., Glenolden, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
.....
....., Albert, 1st Lieut., Butler, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
....., Cormick, 1st Lieut., McDonald, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
JOYCE, William Thomas, 1st Lieut., Muncie, Pa., Indiantown Gap Military Reservation, Indiantown Gap, Pa.
LAULER, John William, 1st Lieut., Jersey Shore, Pa., Fort Story, Va.

An accident occurred for every two hundred and fourteen hours of flying in 1921 and one for every one thousand, nine hundred and forty-one hours in 1940. In these accidents seventy-three persons were killed in 1921 and eighty-eight in 1940, a death for every thousand hours of flying in 1921 and one for every ten thousand in 1940.

In the current fiscal year the accident rate has increased because of the great expansion in the Air Corps. During the six months ended Dec. 31, 1940 there were eighty-five fatalities; in January there were nineteen and in February twenty-eight. These deaths occurred in seventy-three accidents. Because of the expansion the training period has been nearly halved, and supervisory personnel must be spread more thinly in proportion to the increase.

Airdrome discipline, air control about the airdrome and bad weather are important factors in accidents. The experimental division of the Air Corps as well as scientists in many technical institutions are working on devices to overcome adverse weather conditions.

WAR DEPARTMENT WANTS MORE MEDICAL RESERVE OFFICERS

The War Department has announced that there are several thousand vacancies in the Medical Reserve Corps and that qualified doctors of medicine of draft age are encouraged to apply for commissions in the Medical Reserve Corps regardless of whether or not they have been inducted or are awaiting induction. Successful applicants will be commissioned as first lieutenants, even though it is not practicable to order them to extended active duty at once.

The National Headquarters of the Selective Service System have asked state directors to request local boards to get in touch with all qualified and licensed physicians who have registered under the draft law and encourage them to seek admission to the Reserve Corps instead of inducting them as selectees for military training.

PHYSICIANS IN ACTIVE SERVICE EXEMPT FROM ANNUAL REGISTRATION FEE IN CALIFORNIA

A California law, approved February 3 and immediately effective, exempts from the payment of the annual registration fee of \$2 licensed physicians and certain other practitioners (1) "while engaged in full time active service in the medical corps of the Army, Navy or Marines or in the United States Public Health Service" or (2) while fulfilling their full time period of training and active service, whether as draftees or volunteers, under the Selective Training and Service Act of 1940. The law provides that a licentiate while so exempted shall not engage in any private practice and that exempted persons shall become liable for the annual registration fee on the completion of their period of full service. Exempted persons, however, will have a period of sixty days after becoming resubject to the annual registration fee within which to pay it before being considered delinquent. Any licentiate who completes his period of full time active service within sixty days of the end of the calendar year will be exempt from the payment of the fee for that year.

DR. ABELL URGES RELEASE OF NURSES FOR MILITARY DUTY

Dr. Irvin Abell, chairman of the health and medical committee of the Federal Security Agency, recently issued a statement to employers of nurses on behalf of the recruiting campaign now being carried on through the American Red Cross. Dr. Abell suggested that organizations employing nurses encourage nurses to offer their services for military duty and urged such organizations to hold their positions wherever possible until they return to civilian life. To increase the number of available nurses, Dr. Abell suggested refresher courses for nurses who are now inactive but who are otherwise competent and experienced for nursing staffs. Many of these

nurses have signified their willingness to return to duty during the emergency and could be employed temporarily to substitute for nurses called for military duty.

CONFERENCE OF COUNTY HEALTH PREPAREDNESS COMMITTEES

A conference of county health preparedness committees was held in Albany, N. Y., March 6 on the call of the Legislative Commission to Formulate a Long Range Health Program. The meeting was largely concerned with the relation of these health committees to the local defense committees. Official and voluntary organizations sent representatives. The speakers included Governor Lehman, Lieut. Gov. Charles E. Poletti, who is state coordinator for national defense, and Dr. Robert A. Plunkett, Albany, state superintendent of tuberculosis hospitals, who represented the state health commissioner.

RESERVOIR OF BLOOD PLASMA

The American Red Cross has begun the creation of a national reservoir of blood plasma to be used by the Army and Navy for emergency transfusions as well as for the treatment of civilians injured in disaster, in response to a request from the surgeons general of the two services. Present plans call for the production of 10,000 units of dried plasma. Liquid plasma will also be stored, but the amount has not been determined.

Donors are being enrolled by the Red Cross chapters in the Greater New York area and in Philadelphia. As need arises other chapters will be asked to enroll donors. The processing of whole blood for production of plasma is being done at the laboratories of Sharp and Dohme, Philadelphia.

MEDICAL SUPPLIES GO ABROAD

The Medical and Surgical Supply Committee of America announces that twenty-four ambulances outfitted with a year's supply each of medical and surgical materials are scheduled to leave shortly for Kenya, Africa.

Three Norwegian vessels operating in the British convoy service have received surgical operating sets among other supplies contributed. Each ship will carry three emergency first aid and operating sets placed in the forward, midships and after sections so that at least one might be available in the event that a portion of the craft remains afloat after an attack.

THE LARGEST CLASS AT CARLISLE BARRACKS

Five hundred and sixty-five officers of the various corps of the medical department of the United States Army are now under instruction at the Medical Field Service School, Carlisle Barracks, Pa., for training in tactics, map reading, sanitation, administration and kindred subjects. This is the largest class in the history of this school, and although the number of officers in each class is usually less than one hundred, the facilities at Carlisle Barracks are considered adequate for this emergency class.

MEDICOMILITARY SYMPOSIUM

The fourth annual Medicomilitary Symposium of the Second Military Area was held at the Federal Building in New York, March 26. The program included motion pictures, a demonstration of a court martial and the army laboratory at work, and exhibits on venereal disease control, the ration, skeletal traction apparatus, stab wounds of the chest and fracture therapy. The fourth annual dinner was held at the Columbia University Club, March 29, in honor of Col. Charles M. Watson, corps area surgeon.

Naval Medical Meeting

At the March 3 meeting of medical and dental officers of the Navy at the Naval Medical School, Washington, D. C., Dr. Philip D. Wilson, medical director of the American Hospital in Britain, spoke on "Surgical Work in England."

ORGANIZATION SECTION

THE CLEVELAND SESSION

AMERICAN MEDICAL ASSOCIATION, NINETY-SECOND ANNUAL SESSION

CLEVELAND, OHIO, JUNE 2-6, 1941

OFFICIAL CALL

TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The ninety-second annual session of the American Medical Association will be held in Cleveland, June 2-6, 1941.

The House of Delegates will convene at 10 a. m., Monday, June 2. In the House the representation of the various constituent associations for 1941, 1942 and 1943 is as follows:

Alabama	2	New Hampshire	1
Arizona	1	New Jersey	5
Arkansas	2	New Mexico	1
California	8	New York	19
Colorado	2	North Carolina	3
Connecticut	2	North Dakota	1
Delaware	1	Ohio	7
District of Columbia	1	Oklahoma	2
Florida	2	Oregon	1
Georgia	3	Pennsylvania	11
Idaho	1	Rhode Island	1
Illinois	9	South Carolina	2
Indiana	4	South Dakota	1
Iowa	3	Tennessee	2
Kansas	2	Texas	5
Kentucky	3	Utah	1
Louisiana	2	Vermont	1
Maine	1	Virginia	2
Maryland	2	Washington	2
Massachusetts	6	West Virginia	2
Michigan	5	Wisconsin	3
Minnesota	4	Wyoming	1
Mississippi	2	Alaska	1
Missouri	4	Hawaii	1
Montana	1	Isthmian Canal Zone	1
Nebraska	2	Philippine Islands	2
Nevada	1	Puerto Rico	1

The sixteen scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each.

The Scientific Assembly of the Association will open with the general meeting, to be held at 8 p. m., Tuesday, June 3. The sections will meet Wednesday, Thursday and Friday, June 4, 5 and 6, as follows:

CONVENING AT 9 A. M., THE SECTIONS ON

Practice of Medicine.	Preventive and Industrial
Obstetrics and Gynecology.	Medicine and Public Health.
Laryngology, Otolary and	Urology.
Rhinology.	Orthopedic Surgery.
Pathology and Physiology.	Anesthesiology.

CONVENING AT 2 P. M., THE SECTIONS ON

Surgery, General and Abdominal.	Nervous and Mental Diseases.
Ophthalmology.	Dermatology and Syphilology.
Pediatrics.	Gastro-Enterology and Proctology.
Pharmacology and Therapeutics.	Radiology.

The Registration Department will be open from 8:30 a. m. until 5:30 p. m., Monday, Tuesday, Wednesday and Thursday, June 2, 3, 4 and 5, and from 8:30 a. m. to 12 noon, Friday, June 6.

NATHAN B. VAN ETEN, President.

H. H. SHOULDERS, Speaker, House of Delegates.

OLIN WEST, Secretary.

MEMBERS OF THE HOUSE OF DELEGATES

A Preliminary Roster of the Legislative Body of the American Medical Association

The list of members of the House of Delegates for the session is incomplete, as a number of the state associations are yet to hold their meetings at which delegates will be elected. The following is a list of the holdover members of the House of Delegates and of the newly elected members who have been reported to the Secretary in time to be included:

STATE DELEGATES

ALABAMA

J. N. Baker, Montgomery.
A. A. Walker, Birmingham.

ARIZONA

Harold W. Kohl, Tucson.

ARKANSAS

E. E. Barlow, Dermott.

CALIFORNIA

Elbridge J. Best, San Francisco.
Lyell C. Kinney, San Diego.
Lowell S. Goin, Los Angeles.
Edward N. Ewer, Oakland.
Edward M. Pallette Sr., Los Angeles.
Robert A. Peers, Colfax.
William R. Molony Sr., Los Angeles.
Henry S. Rogers, Petaluma.

INDIANA

Don F. Cameron, Fort Wayne.
F. S. Crockett, La Fayette.
Homer G. Hamer, Indianapolis.
George R. Dillinger, French Lick.

IOWA

Thomas F. Thornton, Waterloo.
Arthur D. Woods, State Center.

KENTUCKY

Virgil E. Simpson, Louisville.
J. Duffy Hancock, Louisville.
Arthur T. McCormack, Louisville.

LOUISIANA

James Q. Graves, Monroe.
Leon J. Menville, New Orleans.

MAINE

William A. Ellingwood, Rockland.

MARYLAND

Alfred T. Gundry, Catonsville.
Harvey B. Stone, Baltimore.

MASSACHUSETTS

David D. Scannell, Boston.
Dwight O'Hara, Boston.
Charles E. Mongan, Somerville.
Walter G. Phippen, Salem.
John M. Birnie, Springfield.
Richard H. Miller, Boston.

MICHIGAN

L. G. Christian, Lansing.
Henry A. Luge, Detroit.
Thomas K. Gruber, Eloise.
Frank E. Reeder, Flint.
Claude R. Keyport, Grayling.

MINNESOTA

Francis J. Savage, St. Paul.

MISSISSIPPI

Felix J. Underwood, Jackson

MISSOURI

Arthur R. McComas, Sturgeon.
Homer L. Kerr, Crane.

MONTANA

James H. Irwin, Great Falls.

FLORIDA

Meredith Mallory, Orlando.
Edward Jelks, Jacksonville.

GEORGIA

Olin H. Weaver, Macon.
Charles W. Roberts, Atlanta.
William H. Myers, Savannah.

IDAHO

E. N. Roberts, Pocatello.

ILLINOIS

John J. Pflock, Chicago.
G. Henry Mundt, Chicago.
Rollo K. Packard, Chicago.
Edwin S. Hamilton, Kankakee.

NEBRASKA
Roy W. Fouts, Omaha.
Karl S. J. Hohlen, Lincoln.

NEVADA
Horace J. Brown, Reno.

NEW HAMPSHIRE
Deering G. Smith, Nashua.

NEW JERSEY
Andrew F. McBride, Paterson.
Lucius F. Donohoe, Bayonne.

NEW MEXICO
H. A. Miller, Clovis.

NEW YORK
Samuel J. Kopetzky, New York.
John J. Masterson, Brooklyn.
Frederic E. Sondern, New York.
James M. Flynn, Rochester.
Thomas A. McGoldrick, Brooklyn.
Walter W. Mott, White Plains.
Peter Irving, New York.
George W. Kosmak, New York.
William H. Ross, Brentwood.
Thomas M. Brennan, Brooklyn.
Edward R. Cuniffe, New York.
Terry M. Townsend, New York.
Edward C. Podvin, New York.

Floyd S. Winslow, Rochester.
William D. Johnson, Batavia.
Harry C. Guess, Buffalo.
Emily D. Barringer, New York.
William A. Groat, Syracuse.
James R. Reuling, Bayside.

NORTH CAROLINA
Wingate M. Johnson, Winston-Salem.
William T. Rainey, Fayetteville.

NORTH DAKOTA
A. P. Nachtwey, Dickinson.

OHIO
Ben R. McClellan, Xenia.
Edmund R. Brush, Zanesville.
Carl R. Steinke, Akron.
John B. Alcorn, Columbus.

OREGON
John H. Fitzgibbon, Portland.

PENNSYLVANIA
David W. Thomas, Lock Haven.
J. Newton Hunsberger, Norristown.
Robert L. Anderson, Pittsburgh.
Franklin P. Lytle, Birdshoro.
Charles G. Strickland, Erie.

Walter F. Donaldson, Pittsburgh.
Francis F. Borzell, Philadelphia.
James S. Carpenter, Pottsville.
Leonard G. Redding, Scranton.
Charles H. Henninger, Pittsburgh.
Clarence R. Phillips, Harrisburg.

RHODE ISLAND
Guy W. Wells, Providence.

SOUTH CAROLINA
Joseph H. Cannon, Charleston.

SOUTH DAKOTA
John R. Westaby, Madison.

TENNESSEE
E. G. Wood, Knoxville.
H. B. Everett, Memphis.

TEXAS
Howard R. Dudgeon, Waco.
Alonzo A. Ross, Lockhart.
Edward H. Cary, Dallas.

UTAH
John Z. Brown, Salt Lake City.

VERMONT
B. F. Cook, Rutland.

VIRGINIA
Alexander F. Robertson Jr., Staunton.
Walter B. Martin, Norfolk.

WASHINGTON
John H. O'Shea, Spokane.
Raymond L. Zech, Seattle.

WEST VIRGINIA
Ivan Fawcett, Wheeling.
Walter E. Vest, Huntington.

WISCONSIN
Joseph F. Smith, Vausau.
Stephen E. Gavin, Fond du Lac.
James C. Sargent, Milwaukee.

WYOMING
George P. Johnston, Cheyenne.

ISTHMIAN CANAL ZONE
Lewis B. Bates, Ancon.

PHILIPPINE ISLANDS
Henry S. Waters, Iloilo.

PUERTO RICO
M. de la Pila, Ponce.

DELEGATES FROM THE SECTIONS AND GOVERNMENT SERVICES

PRACTICE OF MEDICINE
J. E. Paullin, Atlanta, Ga.

SURGERY, GENERAL AND ABDOMINAL
Fred W. Rankin, Lexington, Ky.

BUREAU OF MEDICAL ECONOMICS—R. G. Leland, Director, Chicago.

CHEMICAL LABORATORY—Paul Nicholas Leech, Director, Chicago.

LIBRARY—Marjorie Hutchins Moore, Librarian, Chicago.

* Deceased.

CLEVELAND—THE CONVENTION CITY

General Moses Cleveland founded the town of Cleveland at the mouth of the winding Cuyahoga River and laid out the Public Square in 1796. When the original colonies gave back to the government their claims to land in the western region, the government granted ownership to Connecticut to a tract of three million acres, which was called the Western Reserve. The Connecticut Land Company purchased the site of the Public Square in Cleveland for \$1.75. Today it is the hub of activities of the present great city, which, with the suburbs, has a population of 1,216,529. The Western Reserve region still has a New England atmosphere. Some of the smaller towns might on casual inspection be mistaken for New England villages. While this tradition gives a predominating note to the background of the city, recent studies show in the population a large proportion of foreign born or children of foreign born with a pronounced tendency toward Americanization. Many contributions to the cultural and industrial life of the city have been made by these citizens.

The opening of the Ohio Canal from Cleveland south to Portsmouth on the Ohio River was the factor which determined that Cleveland would be the important port rather than the settlements on other nearby rivers which flow into Lake Erie.

Youngstown—of the greatest importance in the defense program. Cleveland leads the world in the production of heavy machinery, bolts and screws, malleable castings, wire and nails. It is one of the nation's largest hardware centers. The Cleveland-Youngstown-Pittsburgh region has been called the "Ruhr of America," because of its production of steel, now raised to the highest level in history. Recently Cleveland has assumed special significance in the manufacture of airplane parts, machine tools and parts for automobiles and trucks. Its manufactures include also wire, electrical machinery, sewing machines, automotive bodies, paints, multigraph and addressograph office machinery, ready-made clothing, knit goods, brick and tile.

Cleveland's stores offer excellent shopping opportunities. One of its great stores sells more than fifty million dollars' worth of merchandise annually. Euclid Avenue is famous throughout the world as a shopping center. One of Cleveland's banks has more depositors than any other bank in any American city; indeed, in this community the branch banking system has reached its greatest development.

Cleveland has witnessed two of the greatest developments in recent years: the Mall and the mammoth Terminal Group of buildings. The Mall extends from the lake front into the heart

DOWNTOWN CLEVELAND WITH THE STADIUM AND LAKE ERIE IN THE BACKGROUND. THE LEFT ARROW POINTS TO THE TERMINAL BUILDING AND THE RIGHT ARROW TO THE PUBLIC AUDITORIUM, WHERE THE SESSIONS WILL BE HELD

Thus Cleveland became the lake outlet for agricultural and mineral products of the state of Ohio. Cleveland was the natural meeting point of iron ore from the Lake Superior region and coal from West Virginia, Pennsylvania and southern Ohio. Many large ore and coal companies still maintain their central offices in Cleveland.

Iron and steel have been Cleveland's premier industries since 1828, when the first smelter was established. The present capacity of millions of tons of pig iron annually make Cleveland and nearby ports and cities—Lorain, Sandusky, Ashtabula, Fairport and Conneaut, Akron, Canton, Niles, Warren and

of the business district. On its nearly seventeen acres have been erected the Public Auditorium, where the annual session of the American Medical Association will be held, the City Hall, Cuyahoga County Court House, Public Library, Board of Education Building, Federal Building, and the Municipal Stadium along the lake.

The Cleveland Public Auditorium is perhaps the most complete municipal auditorium in the United States. The main auditorium seating twelve thousand five hundred and the Music Hall seating three thousand have a common stage before which sixteen thousand persons can be seated for a single event. The

other halls in the building have seating capacities ranging from ninety to five hundred, while the Little Theater and the Ball Room will seat seven hundred and one thousand five hundred respectively. The Public Auditorium contains two hundred thousand square feet for exhibition purposes, and every modern exhibit facility. A municipal underground garage, communicating directly with the Public Hall and accommodating five hundred cars, will be open for the annual meeting. The hall is within easy walking distance of the principal hotels in the heart of the downtown district.

THE MEDICAL CENTER

Cleveland at one time had four medical schools. Two of them merged; the other two have ceased to exist. The School of Medicine of Western Reserve University is the center of medical Cleveland. It is located near the campus of Adelbert College of Western Reserve University. The physical plant of the medical school is a five story limestone building completed in 1924, the gift of the late Samuel Mather. Directly opposite the medical school are Babies' and Childrens' and Maternity Hospitals, while a few hundred yards north are the handsome buildings of the University Hospitals, all connected with one another and

WESTERN RESERVE UNIVERSITY SCHOOL OF MEDICINE

ALLEN MEMORIAL MEDICAL LIBRARY — CUSHING READING ROOM

with the medical school by tunnels. The University Hospital group includes Lakeside Hospital, the Hanna House private pavilion, the Pathological Institute and the School of Nursing. The four hundred bed Lakeside, the largest private hospital in Cleveland, is one of the foremost examples of hospital architecture and equipment in the country.

The beautiful home of the Cleveland Medical Library and the Cleveland Academy of Medicine is at the corner of Adelbert Road and Euclid Avenue. The building, the Dudley P. Allen Memorial, is owned by the library association, which has an endowment of almost \$400,000. Last year the medical library by actual count had fifty-eight thousand five hundred volumes, including the priceless Nicolas Pol collection of incunabula; it subscribed to two hundred and eighty-three American and British periodicals and to one hundred and eighty-seven in other languages. In this building also are a medical museum, seminar rooms, reading rooms, offices and an auditorium seating five hundred, while surrounding it are the various departments of Western Reserve University and the Case School of Applied Sciences. The Museum of Historical and Cultural Medicine contains four thousand objects of the medical history of Ohio, including, for example, two old pharmacies with counters, bottles and scales; old microscopes, utensils for infant feeding and many other collections. In the library building are study rooms which

are assigned to members for long continued work. Notable is the William Thomas Corlett study for dermatology and syphilology, the John Phillips study for internal medicine, and the Samuel Walter Kelley study for the surgical diseases of childhood. Directly across from the Allen memorial on Euclid Avenue is Severance Hall, home of the Cleveland orchestra, of which Artur Rodzinski is the conductor.

MUSEUM OF ART

Near the medical center is the Cleveland Museum of Art on East Boulevard north of Euclid Avenue, facing a lagoon and the Fine Arts Gardens. The Museum of Art is open to the public from 9 a. m. to 5 p. m. except on Monday; on Wednesday it is open until 10 p. m. and on Sundays from 1 to 6 p. m. Convention visitors will be admitted without charge. This museum has many fine collections, notably Italian primitives, Whistler etchings, the Bellows lithographs and lace, early American silver, medieval armor, and objects from the Guelph Treasure. Nearby is the Western Reserve Historical Society, occupying two magnificent adjoining residences, one the former home of Mrs. John Hay, the other of Mrs. Leonard C. Hanna. These are on East Boulevard facing Wade Park, a short distance north of Severance Hall and the Cleveland Museum of Art. The Library of the Western Reserve Historical Society contains two hundred thousand volumes on history and genealogy, and the largest collection of early newspapers in the United

States. The David Z. Norton Napoleon Bonaparte collection is regarded as the largest in this country. Here one will see, among many other objects, John Brown's desk. The library is open daily from 10 to 5 o'clock, except on Monday, when it is closed, and on Sunday, when it is open from 2 to 5 p. m.

A new institution is the Cleveland Health Museum, the first permanent public health museum on the western continent. The Health Museum is at Euclid Avenue at East Eighty-Ninth Street, about 1 mile west of the university group.

The Cleveland Museum of Natural History is located at 2712 Euclid Avenue on the outskirts of the business district. Here, among others, are exhibits of African big game collected by Dr. George W. Crile, the Jephtha Wade Game collection and the Johnstown mastodon. The museum is opened from 10 a. m. to 4 p. m. on week days. Admission is free.

The Dunham Tavern, at 6709 Euclid Avenue, is on the site of a log cabin built by Rufus and Jane Dunham, who were pioneers from New England. For years this tavern was on the stage coach road between Cleveland and Buffalo. Among its antiques is the old kitchen place with side oven and cradle. The tavern is open daily except Monday. The University district is about $3\frac{1}{2}$ miles east of Cleveland's Public Square and only a short distance from the uptown business district at Euclid Avenue and One Hundred and Fifth Street.

CLEVELAND HOSPITALS

North of the University district is Mount Sinai Hospital, Cleveland's third largest private hospital; nearby Rockefeller Park winds northward to Lake Erie. The Woman's Hospital is in this district, and half a mile westward is the Cleveland Clinic, organized by Dr. George W. Crile and his associates about seventeen years ago. Medical students receive clinical instruction in Lakeside and affiliated hospitals and in St. Vincent Charity and City Hospitals. St. Vincent Charity, formerly known as Charity Hospital, is one of Cleveland's pioneer institutions, the first patient, a Union soldier, having been admitted during the Civil War. This institution, on East Twenty-Second Street four blocks south of Euclid, has contributed much to the medical history of the community. St. Vincent Charity remains as the only hospital in downtown Cleveland, St. Luke's Lakeside, Huron Road and the U. S. Marine Hospitals having left the downtown section in recent years for more open spaces in outlying districts on the east side.

in Cleveland. In 1940, \$3,278,969.19 was subscribed to the Community Fund for the welfare activities of the community. The Welfare Federation supervises the budgeting and division of funds among the various agencies. The Hospital Council is a subsidiary organization which aids the participating hospitals in their common financial relations and in their mutual administrative problems.

St. Luke's Hospital, affiliated with the Methodist Episcopal Church, occupies a monumental modern plant on Shaker Boulevard in the southeastern part of the city. St. Luke's, with three hundred and ninety beds, is the second largest private hospital in Cleveland. St. Alexis Hospital, of two hundred and twenty bed capacity, in the steel mill district on the south side, is one of the oldest hospitals in the city. St. Alexis, St. John's, St. Ann's Maternity Hospital and Charity Hospital are the major Catholic hospitals of the community. The two hundred and seven bed hospital of St. John's is located on Detroit Avenue on the west side, while St. Ann's Maternity is on lower Woodland Avenue.

Education and Art

CLEVELAND MUSEUM OF ART

CLEVELAND PUBLIC LIBRARY

BOARD OF EDUCATION BUILDING

THE DEPARTMENT OF WELFARE

The Department of Welfare of the City of Cleveland comprises the department of health, the City Hospital, the City Correction Farm at Warrensville, and Sunny Acres Tuberculosis Sanitarium. Mr. Fred Ramsey is the present director of the Department of Welfare. The sixteen hundred bed City Hospital has general wards for medical, surgical, pediatric and dermatologic patients, a psychopathic division, contagious disease hospitals, pathologic laboratories, and the Lowman Pavilion for Tuberculous Patients. The tuberculosis and psychopathic divisions serve as clearing houses for acute cases within these specialties. After observation and study here many of the patients are then transferred to appropriate city, county or state institutions for further care.

Cleveland's hospitals and welfare activities are coordinated by the Welfare Foundation, which has been faithfully administered for many years by public spirited citizens. The Community Fund idea found its inception and greatest development

The Lutheran and Fairview hospitals on the west side, Grace Hospital on the southwest, Evangelical-Deaconess in the section of the city called Brooklyn, and Glenville Hospital in the northeastern part of the city are among the other community fund hospitals. The one hundred and twenty-five bed Rainbow Hospital on South Euclid Avenue, affiliated with the University, is a convalescent hospital for chronic orthopedic and medical conditions in children. The Huron Road Hospital, which formerly was in the downtown section, has completed a new home in East Cleveland since the last meeting of the Association in this city, in 1934.

THE ACADEMY OF MEDICINE

The Cleveland Academy of Medicine, which is also the Cuyahoga County Medical Society, fulfils the functions implied in both titles and has its own headquarters in conjunction with the Cleveland Medical Library. The Academy of Medicine helps its members to improve the professional aspects of their calling and represents its members in their relation to

the public. Through its offices in this building the work of some forty committees is coordinated and a multitude of continuous contacts established with health agencies. Thus it is in a position to present the medical point of view when problems arise involving the public health or the profession. The scientific activities of the Academy of Medicine comprise monthly general meetings and periodic meetings of the various sections of the academy and one annual library meeting, totaling twenty-three. The committee on health education presents an ever enlarging program to the public through lectures and the radio. The committee's annual Sunday afternoon health lectures during the past ten years have become an important part of Cleveland's public educational program. The Academy's medical preparedness committee has coordinated the local

along which instructive hikes are conducted under the auspices of the Cleveland Museum of Natural History. The suburbs of Cleveland, especially Lakewood, Cleveland Heights, Shaker Heights and Bratnahl, are notable as attractive residential districts.

GARDENS

The Cultural Gardens, on East Boulevard near Superior Avenue, are maintained under the auspices of different racial groups. The different gardens symbolize the contributions of foreign groups to the cosmopolitan life of the city. Here are the Shakespeare, the German, Italian, Hebrew and other gardens. The Fine Arts Garden in front of the Cleveland Museum of Art, around the lagoon in Wade Park, is of especial beauty with its statuary and fountains. In the country to the east is

MEDICINAL PLANT GARDEN OF
WESTERN RESERVE UNIVERSITY

NELA PARK

MUSEUM OF NATURAL HISTORY

CLEVELAND HEALTH MUSEUM

medical contributions to the preparedness activities, and the Committee on Economics is now completing its study of plans of medical care for Cuyahoga County. The Academy of Medicine has a twenty-four hour information service which not only locates academy members for their patients but acts also as an officially recognized information bureau on medical subjects for the community. The executive office of the Academy is also the local headquarters for the medical section of the Red Cross Disaster Relief.

CLEVELAND PARKS

The Cleveland area has two park systems, an inner one, forming an incomplete circle, located chiefly in the city proper, and an outer park system, called the Metropolitan, in the country. In the latter are camp grounds, trails and many drives

a medicinal plant garden, the Squire Valleeve Farm, which is connected with the School of Pharmacy of Western Reserve University; here is produced all the digitalis used in the University Hospitals.

HISTORICAL PLACES

Along the motor roads leading to Cleveland are many historical places. The former home of President James A. Garfield at Mentor is open to the public, and at Kirtland, not far away, is the first temple erected by the Mormons before they moved westward. A memorial to Commodore Oliver H. Perry, who defeated the British fleet in the War of 1812, may be visited at Put-in-Bay, near Sandusky. Among other places of interest nearby is Johnson's Island, which was a prison for Confederate officers during the Civil War. This district is an

important fishing center and is in the heart of a thriving wine industry.

At Milan, near Sandusky, is the cottage in which Thomas Edison was born, and at Fremont, nearby, is the estate to which President Rutherford Hayes retired after leaving the White

House. To the west is Oberlin with its famous college, and south of Cleveland is Hudson, which still looks like a New England village. Here was once the home of John Brown and also of Western Reserve University, but now it has the lovely campus of Western Reserve Academy.

REGISTRATION

The Bureau of Registration will be located on the lower level of the Cleveland Public Auditorium, Lakeside Avenue at East Sixth Street. Members of the Subcommittee on Registration of the Local Committee on Arrangements will be on hand to assist those who desire to register. A branch postoffice in charge of government postoffice officials will be available for visitors, and an information bureau will be operated in connection with the Bureau of Registration.

Who May Register

Only Fellows, Affiliate, Associate and Honorary Fellows, and Invited Guests may register and take part in the work of the sections. Fellows of the Scientific Assembly are those who

Those subscribers to THE JOURNAL who have not received pocket cards for 1941 should write to the American Medical Association in order to obtain application blanks and information as to further requirements.

Register Early

Fellows living in Cleveland, as well as all other Fellows who are in Cleveland on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

PUBLIC AUDITORIUM WHERE THE SESSIONS WILL BE HELD

have, on the prescribed form, applied for Fellowship, subscribed to THE JOURNAL and paid their Fellowship dues for the current year. Fellowship dues and subscription to THE JOURNAL are included in the one annual payment of eight dollars, which is the regular subscription price of THE JOURNAL. Fellowship cards are sent to all Fellows after payment of annual dues, and these cards should be presented at the registration window. Any who have not received cards for 1941 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street, Chicago.

Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to Cleveland so that registration can be more easily and more promptly effected.

Application forms may be had on request.

Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the *white* registration card, which will be found on the tables in front of the Registration Bureau.

Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the *blue* registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, published on Tuesday, Wednesday, Thursday and Friday of the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out *white* registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge, a copy of the official program and other printed matter of interest to those attending the annual session.

As previously stated, it will assist in registering if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago, so that their Fellowship may be entered not later than May 5. Any applications that are received later than May 5 will be given prompt

attention, but the Fellowship pocket card may not reach the applicant in time for him to register at the Cleveland session.

It will be possible for members of the organization to qualify as Fellows at Cleveland. In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the *blue* registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at

Cleveland bring with them their state membership cards for the year 1941. The state membership card should be presented along with the filled in *blue* registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests."

As already stated, registration can be effected more easily and more promptly if members will qualify as Fellows before leaving home.

TRANSPORTATION

Registration for General Officers and Delegates at Hotel Statler

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly in the Pine Room, adjacent to the Euclid Ball Room of the Hotel Statler. This arrangement is made for the convenience of the members of the House of Delegates, which will convene on Monday morning at 10 o'clock in the Euclid Ball Room of the Hotel Statler. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration of delegates for the Scientific Assembly will begin at 8 o'clock, Monday morning, June 2, and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House.

Railroad Rates to Cleveland

Because of the reduction in one way fares effective June 1, 1936, the use of convention fares has been discontinued in the territories of railway passenger associations.

In the territory of the Central Passenger Association and in that of the Trunk Line Association, the fares vary for travel in sleeping or parlor cars and in coaches. The suggestion is offered that members of the Association traveling to Cleveland from the territories of the Central Passenger and Trunk Line associations consult their ticket agents a week or so in advance of the time at which they expect to start to Cleveland for the exact rates that will be in effect then, not only for individuals but also for parties that may be traveling together.

In the territory of the Southern Passenger Association, daily round trip fares are in effect to Cleveland on the

a limit of thirty days in addition to the date of sale. Local ticket agents will be able to furnish more complete information at the time tickets are purchased.

In the territory of the Southwestern Passenger Association, daily round trip fares are in effect to Cleveland on the basis of fare and one half or $2\frac{3}{4}$ cents a mile in each direction to its gateways added to the reduced fares of Southern Passenger and Central Passenger Associations, tickets at these fares generally offering limit of sixty days in addition to date of sale, although

in some cases lower fares are available with thirty day limit, and six month limit tickets may also be obtained at slightly higher fares, the usual charges being made for space occupied in sleeping and parlor cars. Lower fares are available to those desiring to travel in coaches. The suggestion is offered that members of the Association traveling from points in the territory of the Southwestern Passenger Association consult their local ticket agents for details of arrangements that apply from starting points.

In the territory of the Trans-Continental and Western Passenger associations low round trip fares will be in effect daily for travel in sleeping and parlor cars on the payment of the usual charges for the space which is occupied.

In a part of these territories low intermediate class fares, good for transportation in tourist sleeping cars, will also be available on the payment of charges for the space occupied.

In the territory of the Canadian Passenger Association, in addition to one way

CLEVELAND PUBLIC SQUARE SHOWING THE TERMINAL BUILDING TOWER
THE HOTEL CLEVELAND IS ON THE RIGHT

basis of $2\frac{1}{2}$ cents a mile in each direction to the gateways of its territory, plus double the one way first class fares therefrom, tickets being honored in sleeping or parlor cars on payment of charges for space occupied. Moreover, reduced fares are in effect on a slightly lower basis from all points in the Southern Passenger Association territory to Cleveland for tickets which are good for transportation in upper berths only and which bear

tickets, round trip tickets may be purchased which are computed on the basis of a rate 10 per cent less than double the rate for one way fares, which bear a limit of six months from the date of sale and which are available for stop over privileges. Moreover, summer or other reduced fares are in effect during certain parts of the year, details of which are available on application to any railway agent.

For information regarding specific fares and the most advantageous arrangements from starting points, all members who expect to attend the annual session in Cleveland are urged to consult their local ticket agents.

The New York Central System, the Nickel Plate and the Baltimore and Ohio railway systems use the new Union Terminal on the Public Square in the center of the business district, while the Pennsylvania uses the old Union Depot on the lake front at West Ninth Street and a station located at East Fifty-Fifth Street and Euclid Avenue. The Erie station is below the Superior Avenue High Level bridge at the foot of a ramp leading from Superior Avenue.

Air Travel

By air, Cleveland is just a few hours from most of the important cities in the United States. Sleeper accommodations are available on overnight journeys on most of the transcontinental services. Your nearest Airline Ticket Office, Travel Bureau or Hotel Transportation Desk will gladly arrange your itinerary. The American, Pennsylvania, Central and United lines have daily service to and from Cleveland. The airport in Cleveland is located southwest of the city and may be reached by taxicab or bus.

The Cleveland Municipal Airport is one of the largest and finest in the country. For several years it was the scene of the National Air Races. More than one hundred planes of the American, Pennsylvania, Central and United lines land and take off from this airport daily, the total number of passengers

during the year 1940 reaching more than three hundred thousand.

Boat Travel

The Detroit and Cleveland Navigation Company utilizes the docks at the foot of East Ninth Street, landing passengers from Detroit in the morning and departing for Detroit about midnight.

Bus Travel

The Greyhound, the Blue-Ridge Greyhound and the Penn-Ohio Coach lines use the bus station located at Superior Avenue and East Ninth Street.

Local Transportation

Local transportation is by means of surface street cars and buses operated by the street railway company and a rapid transit line running from the Union Terminal by private right-of-way which gives remarkably quick transportation to the Shaker Heights district, the running time between the Terminal and Shaker Square being only thirteen minutes.

Taxicab transportation in Cleveland is relatively cheap, the fare from any of the leading downtown hotels to the Cleveland Public Auditorium ranging from 20 to 35 cents, and from any of the leading downtown hotels to the Allen Memorial Medical Library or the Art Museum, about 90 cents. The rates are the same when the cabs are used by four, three or two passengers as for a single passenger. Sight seeing trips may be arranged through the taxicab companies.

CLEVELAND HOTELS

A list of Cleveland hotels is presented for the benefit of those who expect to attend the annual session of the American Medical Association, June 2-6. Dr. Edward F. Kieger is chairman of the Subcommittee on Hotels of the Local Committee on Arrangements and may be addressed at 1604 Terminal Tower, Cleveland, Ohio. The advertising announcement and a coupon

to be used for making reservations appear on advertising page 104 of this issue.

Since reservations are cleared through the subcommittee on hotels, it will greatly expedite matters if requests for reservations are addressed directly to Dr. Kieger, who, as stated, may be reached at 1604 Terminal Tower, Cleveland, Ohio.

American Physicians' Art Association

The American Physicians' Art Association will hold its fourth annual exhibition at the Masonic Temple, June 2-6. Physician-artists may secure further information by writing Dr. F. H. Redewill, Secretary, American Physicians' Art Association, 870 Market Street, San Francisco, Calif.

GOLF TOURNAMENT

The American Medical Golfing Association will hold its twenty-seventh annual tournament at Cleveland Country Club and Pepper Pike Club in Cleveland on Monday, June 2. Members may tee off from 7:30 a. m. to 2 p. m.

FIFTY TROPHIES AND PRIZES

Thirty-six holes of golf will be played in competition for the fifty trophies and prizes in the eight events. Trophies will be awarded for the Association Championship, thirty-six holes gross, the Will Walter Trophy; the Association Handicap

TWO EIGHTEEN HOLE CHAMPIONSHIP COURSES

The twenty-seventh tournament of the American Medical Golfing Association at the Cleveland Country Club and Pepper Pike Club promises to be a wonderful affair. The two courses are of championship caliber and the clubhouse of the Cleveland Country Club, where the golfers' banquet will be held at 7 p. m., is one of the most beautiful and elaborately spacious in the country. The officers of the American Medical Golfing Association anticipate that some two hundred and fifty to three hundred medical golfers from all parts of the United States will play thirty-six holes in Cleveland on June 2.

THE GOLF TOURNAMENT WILL BE HELD AT THESE CLUBS

PEPPER PIKE COUNTRY CLUB

THE CLEVELAND COUNTRY CLUB

Championship, thirty-six holes net, the Detroit Trophy; Championship Flight, First Gross, thirty-six holes, the St. Louis Trophy; Championship Flight, First Net, thirty-six holes, the President's Trophy; Eighteen Hole Championship, the Golden State Trophy; Eighteen Hole Handicap Championship, the Ben Thomas Trophy and the Atlantic City Trophy; Maturity Event, limited to Fellows over 60 years of age, the Minneapolis Trophy; and the Oldguard Championship, limited to competition of past presidents, the Wendell Phillips Trophy. Forty other prizes will be awarded for the various flights.

DR. JOHN B. MORGAN HEADS CLEVELAND GOLF COMMITTEE

The Cleveland Golf Committee is under the able chairmanship of Dr. John B. Morgan, 25 Prospect Avenue N.W., Cleveland, who headed the golfing group when the American Medical Association met in Cleveland in 1934. He will be assisted by Drs. William J. Engel, Farrell T. Gallagher and F. W. Merica.

APPLICATION FOR MEMBERSHIP

All male Fellows of the American Medical Association are eligible and cordially invited to become members of the American Medical Golfing Association. Write Executive Secretary Bill Burns, 2020 Olds Tower, Lansing, Mich., for application blank. Participants in the American Medical Golfing Association tournament are required to present their home club handicap, signed by the club secretary, at the first tee on the day of play. No handicap over thirty is allowed. Only active Fellows of the American Medical Golfing Association may compete for prizes. No trophy is awarded a Fellow who is absent from the annual dinner, which is always worth while waiting for!

THE PROGRAMS OF THE SECTIONS

Outline of the Scientific Proceedings—The Preliminary
Program and the Official Program

The following papers are announced to be read before the
various sections. The order here is not necessarily the order
that will be followed in the Official Program, nor is the list
complete. The Official Program will be similar to the pro-
grams issued in previous years and will contain the final pro-
gram of each section with abstracts of the papers, as well as
lists of committees, program of the Opening General Meeting,
list of entertainments, map of Cleveland, and other informa-
tion. To prevent misunderstandings and protect the interest of
advertisers, it is here announced that this Official Program
will contain no advertisements. It is copyrighted by the Ameri-
can Medical Association and will not be distributed before the
session. A copy will be given to each Fellow on registration.

SECTION ON PRACTICE OF MEDICINE

MEETS IN BALL ROOM, FOURTH FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—FRED M. SMITH, Iowa City.

Vice Chairman—W. W. PALMER, New York.

Secretary—W. D. STROUD, Philadelphia.

Executive Committee—N. C. GILBERT, Chicago; WILLIAM S.
McCANN, Rochester, N. Y.; FRED M. SMITH, Iowa City.

Wednesday, June 4—9 a. m.

Lymphatic Leukemia (Lantern Demonstration).

FRANK H. BETHELL, Ann Arbor, Mich.

Important Facts Additive to the Clinical and Hematologic
Recognition of Atypical Lymphatic Leukemia (Lantern
Demonstration). B. K. WISEMAN, Columbus, Ohio.

Clinical and Laboratory Studies of the Effect of Radioactive
Phosphorus on Leukemia (Lantern Demonstration).

C. P. RHODES, New York.

The Frank Billings Lecture: Boeck's Sarcoid (Lantern Demon-
stration). WARFIELD T. LONGCOPE, Baltimore.

Therapeutic Experiences in Hodgkin's Disease (Lantern Dem-
onstration). OVID O. MEYER, Madison, Wis.

Discussion to be opened by RAPHAEL ISAACS, Ann Arbor,
Mich.

Roentgen Observations in Boeck's Sarcoid, Hodgkin's Disease and Erythema Nodosum (Lantern Demonstration).

MERRILL C. SOSMAN, Boston.

Discussion to be opened by E. P. PENDERGRASS, Philadelphia, and JOHN W. PIERSON, Baltimore.

Thursday, June 5—9 a. m.

Election of Officers

Blood Donors: Their Rate of Hemoglobin Regeneration (Lantern Demonstration).

WILLIS M. FOWLER and A. P. BARER, Iowa City.

Blood Plasma: Its Place in the Practice of Medicine, with Special Consideration of the Problems of Preservation.

MAX M. STRUMIA and JOHN J. MCGRAW, Bryn Mawr, Pa. (Lantern Demonstration).

Discussion on papers of DRs. FOWLER and BARER and DRs. STRUMIA and MCGRAW to be opened by CHARLES A. DOAN, Columbus, Ohio, and PAUL I. HONWORTH, Cincinnati.

Chairman's Address.

FRED M. SMITH, Iowa City.

Management of Scarlet Fever Contacts (Lantern Demonstration).

PAUL S. RHOADS, W. H. TUCKER and BENJAMIN RAPPAPORT, Evanston, Ill.

Nutrition: A Public Health Problem.

RUSSELL M. WILDER, Rochester, Minn.

Discussion to be opened by JAMES S. MCLESTER, Birmingham, Ala.

Geriatrics in National Defense.

EDWARD J. STIEGLITZ, Garrett Park, Md.

Friday, June 6—9 a. m.

JOINT MEETING WITH SECTION ON PHARMACOLOGY AND THERAPEUTICS

The "Anoxemia Test" as an Index of the Coronary Reserve: Serial Observations in Patients with Their Application to the Detection and Clinical Course of Coronary Insufficiency (Lantern Demonstration).

ROBERT L. LEVY, JAMES E. PATTERSON, THOMAS W. CLARK and HOWARD G. BRUENN, New York.

Discussion to be opened by ROY W. SCOTT, Cleveland, and ARLIE R. BARNES, Rochester, Minn.

The Sudden Death of Patients with Few Symptoms of Heart Disease (Lantern and Motion Picture Demonstration).

GEORGE V. LEROY and S. S. SNIDER, Chicago.

Physical Therapy in Internal Medicine (Lantern Demonstration).

GEORGE MORRIS PIERSOL, Philadelphia.

Therapeutic Efficiency of a Digitalis Glucoside, Digilanid C, in Congestive Heart Failure with Normal Sinus Rhythm (Lantern Demonstration).

GEORGE E. FAHR and J. S. LA DUE, Minneapolis.

Discussion to be opened by ARLIE R. BARNES, Rochester, Minn.

Chemotherapy of Pneumonias and Immunity Reactions (Lantern Demonstration).

JESSE G. M. BULLOWA, New York.

Discussion to be opened by WILLIAM H. KELLEY, Charleston, S. C.; LYNN T. HALL, Omaha; JOHN W. BROWN, San Francisco, and ELMER H. LOUGHLIN, Brooklyn.

Elimination Diets (Lantern Demonstration).

ALBERT H. ROWE, Oakland, Calif.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN MUSIC HALL, ARENA FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—LLOYD NOLAN, Fairfield, Ala.

Vice Chairman—THOMAS E. JONES, Cleveland.

Secretary—ARTHUR W. ALLEN, Boston.

Executive Committee—HENRY W. CAVE, New York; THOMAS M. JOYCE, Portland, Ore.; LLOYD NOLAN, Fairfield, Ala.

Wednesday, June 4—2 p. m.

Carcinoma of the Stomach in a Large General Hospital (Lantern Demonstration).

FREDERICK F. BOYCE, New Orleans.
Discussion to be opened by A. W. OUGHTERSON, New Haven, Conn.

Malignant Lesions of the Stomach: Importance of Early Treatment and Results (Lantern Demonstration).

WALTMAN WALTERS, H. K. GRAY and JAMES T. PRIESTLEY, Rochester, Minn.

Discussion to be opened by ELLIOTT C. CUTLER, Boston, and GEORGE T. PACK, New York.

The Effect of Hot and Cold Applications to the Abdominal Wall and Also Hot and Cold Fluids Administered by Mouth on Gastric and Intestinal Secretory and Peristaltic Activity (Lantern Demonstration).

J. DEWEY BISGARD, Omaha.

Discussion to be opened by CHARLES W. MAYO, Rochester, Minn., and JAMES M. WINFIELD, Detroit.

The Miller-Abbott Tube in Surgery (Lantern Demonstration).

OCTA C. LEIGH JR. and RICHARD O. DIEFENDORF, New York.

The Local Use of Powdered Sulfanilamide in Infections of the Peritoneal Cavity (Lantern Demonstration).

R. STERLING MUELLER and JAMES E. THOMPSON, New York.

Discussion to be opened by HENRY W. CAVE, New York.

The Use of Sulfanilamide in the Peritoneum: Experimental and Clinical Observations (Lantern Demonstration).

HOWARD C. JACKSON and FREDERICK A. COLLIER, Ann Arbor, Mich.

Thursday, June 5—2 p. m.

Election of Officers

The Surgical Management of Gallbladder Disease as Correlated with Newer Physiologic Concepts (Lantern Demonstration).

H. GLENN BELL and LEON GOLDMAN, San Francisco.

Discussion to be opened by WARREN H. COLE, Chicago.

The Use of Cotton as a Suture Material, with Particular Reference to Its Clinical Application (Lantern Demonstration).

WILLIAM H. MEADE and CARROLL H. LONG, New Orleans.

Discussion to be opened by DONALD GUTHRIE, Sayre, Pa., and JOHN M. FARRIS, Ann Arbor, Mich.

Embryoma of the Kidney (Wilms Tumor) (Lantern Demonstration).

WILLIAM E. LADD and ROBERT R. WHITE, Boston.

Discussion to be opened by JAMES T. PRIESTLEY, Rochester, Minn.

Chairman's Address: Diagnosis, a Responsibility of the Surgeon.

LLOYD NOLAN, Fairfield, Ala.

Cancer of the Lung of Long Duration (Lantern Demonstration).

ALFRED GOLDMAN, San Francisco.

Discussion to be opened by EDWARD J. O'BRIEN, Detroit.

The Surgical Approach to Hypertension (Lantern Demonstration).

GEZA DE TAKATS and HOWARD E. HEYER, Chicago.

Discussion to be opened by REGINALD H. SMITHWICK, Boston, and PETER HEINBECKER, St. Louis.

Phlebitis and Pulmonary Embolism (Lantern Demonstration).

CLAUDE E. WELCH and HENRY H. FAXON, Boston.

Discussion to be opened by ALTON OCHSNER, New Orleans.

Friday, June 6—9 a. m.

JOINT MEETING WITH THE SECTION ON ORTHOPEDIC SURGERY IN LITTLE THEATER, ARENA FLOOR, CLEVELAND PUBLIC AUDITORIUM

The Mechanism of Delayed Wound Healing in the Presence of Hypoproteinemia (Lantern Demonstration).

JONATHAN E. RHOADS and M. T. FLIEGELMAN, Philadelphia.

Discussion to be opened by I. S. RAYDIN, Philadelphia, and CHARLES G. JOHNSTON, Detroit.

Similarities and Distinctions Between Shock and the Effects of Hemorrhages (Lantern Demonstration).

VIRGIL H. MOON, D. R. MORGAN, M. M. LIEBER and DONALD J. MCGREW, Philadelphia.

Discussion to be opened by LESTER R. DRAGSTEDT, Chicago.

Traumatic Rupture of the Intestine Due to Nonpenetrating Wounds of the Abdomen (Lantern Demonstration).

D. HENRY POER and IRA A. FERGUSON, Atlanta, Ga., and EDWARD WOLIVER, Cincinnati.

Fresh Compound Fractures: Treatment by Sulfa-Drugs and by Internal Fixation in Selected Cases (Lantern Demonstration).

WILLIS C. CAMPBELL and HUGH SMITH, Memphis, Tenn.

Discussion to be opened by WALTER G. STERN, Cleveland; and HAROLD R. BOHLMAN, Baltimore.

- The Splinting of Compound Fractures (Lantern Demonstration). FRANK J. COX, New Orleans.
Discussion to be opened by PHILIP D. WILSON, New York, and ROGER ANDERSON, Seattle.
Chemotherapy in the Treatment of Compound Fractures (Lantern and Motion Picture Demonstration).
REX L. DIVELEY, Kansas City, Mo.
Discussion to be opened by FRANCIS M. MCKEEVER, Los Angeles, and ROBERT W. JOHNSON JR., Baltimore.

SECTION ON OBSTETRICS AND GYNECOLOGY

MEETS IN MUSIC HALL, ARENA FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

- Chairman—NORMAN F. MILLER, Ann Arbor, Mich.
Vice Chairman—WILLARD R. COOKE, Galveston, Texas.
Secretary—PHILIP F. WILLIAMS, Philadelphia.
Executive Committee—HARVEY B. MATTHEWS, Brooklyn; LUDWIG A. EMGE, San Francisco; NORMAN F. MILLER, Ann Arbor, Mich.

Wednesday, June 4—9 a. m.

- Indications and Relative Merits of the Classic, Low and Extra-peritoneal Cesarean Sections (Lantern Demonstration).
SAMUEL A. COSGROVE and JAMES F. NORTON, Jersey City, N. J.
Mortality, Early and Late, Following Cesarean Section (Lantern Demonstration). FREDERICK H. FALLS, Chicago.
Discussion on papers of DRS. COSGROVE and NORTON and DR. FALLS to be opened by LOUIS E. PHANEUF, Boston; H. HUDNALL WARE JR., Richmond, Va., and HERBERT F. TRAUT, New York.
Early Diagnosis and Proper Management in Cervical Cancer (Lantern Demonstration).
DANIEL G. MORTON, San Francisco.
Premarital and Antepartum Wassermann Tests (Lantern Demonstration). CHARLES H. PECKHAM, Cooperstown, N. Y.
Discussion to be opened by CARL P. HUBER, Indianapolis, and HERMAN BEERMAN, Philadelphia.
The Simpson Operation and the Smith Pessary in the Treatment of Retroflexioversion of the Uterus in the Child-bearing Woman (Lantern Demonstration).
BROOKE M. ANSPACH and JOHN B. MONTGOMERY, Philadelphia.
Discussion to be opened by PAUL TITUS, Pittsburgh, and ARTHUR H. BILL, Cleveland.

Thursday, June 5—9 a. m.

- Androgen Therapy in Gynecology (Lantern Demonstration).
SAMUEL H. GEIST, New York.
Uses and Limitations of Estrogens in Gynecic Practice (Lantern Demonstration). E. C. HAMBLIN, Durham, N. C.
Discussion on papers of DRS. GEIST and HAMBLIN to be opened by LUDWIG A. EMGE, San Francisco; CHARLES MAZER, Philadelphia; JEAN PAUL PRATT, Detroit, and JAMES B. HAMILTON, New Haven, Conn.
Pruritus Ani and Vulvae: Diagnosis and Management (Lantern Demonstration). RACHELLE SELETZ, Los Angeles.
Discussion to be opened by E. W. NETHERTON, Cleveland, and H. C. HESSELTINE, Chicago.
Deflexion Attitudes in Breech Presentation (Lantern Demonstration). IRVING F. STEIN, Chicago.
Discussion to be opened by HAROLD HENDERSON, Detroit.
Sulfathiazole in the Treatment of Gonorrhea in Women (Lantern Demonstration). PAUL F. FLETCHER, St. Louis.
Discussion to be opened by V. ROGERS DEAKIN and WILLIAM H. VOGT, St. Louis.
Chairman's Address: The Perpetuation of Error in Obstetrics and Gynecology. NORMAN F. MILLER, Ann Arbor, Mich.

Friday, June 6—9 a. m.

- Election of Officers
The Toxemias of Pregnancy: Their Classification and Aid to Management of Parturition (Lantern Demonstration).
ROBERT D. MUSSEY and ARTHUR B. HUNT, Rochester, Minn.
Discussion to be opened by WILLIAM J. DIECKMANN, Chicago.

- The Importance of Oxygen Tent Therapy as an Additional Measure in the Conservative Treatment of Eclampsia.
ROY E. NICOMEMUS, Danville, Pa.
Discussion to be opened by THADDEUS L. MONTGOMERY, Philadelphia.
The Premarital Medical Consultation (Lantern Demonstration).
ROBERT L. DICKINSON, New York.
Discussion to be opened by SOPHIA J. KLEEGMAN, New York.
Pregnancy with Double Uterus and Vagina: Complications, Management and Prognosis (Lantern Demonstration).
GOODRICH C. SCHAUFFLER, Portland, Ore.
Discussion to be opened by NORMAN F. MILLER, Ann Arbor, Mich.
The Ammonium Chloride Therapy of Premenstrual Distress.
J. P. GREENHILL and S. C. FREED, Chicago.
Discussion to be opened by WILLIAM J. DIECKMANN, Chicago, and JACOB KOTZ, Washington, D. C.

SECTION ON OPHTHALMOLOGY

MEETS IN BALL ROOM OF HOTEL HOLLENDEEN

OFFICERS OF SECTION

- Chairman—ALBERT C. SNELL, Rochester, N. Y.
Vice Chairman—EDWARD M. NEHER, Salt Lake City.
Secretary—DERRICK VAIL, Cincinnati.
Executive Committee—S. JUDD BEACH, Portland, Maine; HARRY S. GRADLE, Chicago; ALBERT C. SNELL, Rochester, N. Y.

Wednesday, June 4—2 p. m.

- Chairman's Address: Some Principles of Medical Ethics and the Practice of Ophthalmology.
ALBERT C. SNELL, Rochester, N. Y.
Traumatic Changes in the Retina, Choroid, Nervehead and Vitreous (Lantern Demonstration).
ARTHUR J. BEDELL, Albany, N. Y.
Discussion to be opened by PARKER HEATH, Detroit, and MORRIS DAVIDSON, New York.
Lime Burns of the Eye. The Use of Rabbit Peritoneum to Prevent Severe Delayed Effects: Experimental Studies and Report of Cases (Lantern Demonstration).
ALBERT L. BROWN, Cincinnati.
Discussion to be opened by EUGENE L. BULSON, Fort Wayne, Ind., and ROBERT J. MASTERS, Indianapolis.
Retinal Phlebosclerosis (Lantern Demonstration).
GLEN GREGORY GIBSON and LAWRENCE W. SMITH, Philadelphia.
Discussion to be opened by CECIL S. O'BRIEN, Iowa City, and HENRY PATRICK WAGENER, Rochester, Minn.
Retinal Arterial Diastolic Blood Pressure and the Caliber of the Retinal Arterioles in Systemic Vascular Hypertension: A Clinical Study (Lantern Demonstration).
FERDINAND L. P. KOCH, New York.
Discussion to be opened by IRVING PUNTENNEY and JAMES E. LEBENSOHN, Chicago.
Causes of Blindness in Pennsylvania: An Analysis of a Group of Over Thirty Thousand Blind Eyes (Lantern Demonstration).
ALFRED COWAN, Philadelphia.
Discussion to be opened by C. W. RUTHERFORD, Indianapolis, and HARRY S. GRADLE, Chicago.

Thursday, June 5—2 p. m.

- The Epidemiology of Inclusion Conjunctivitis (Lantern Demonstration).
PHILLIPS THYGESON, New York.
Discussion to be opened by ALSON E. BRALEY, Detroit, and L. A. JULIANELLE, St. Louis.
Etiology of Uveitis: A Clinical Study of Five Hundred and Sixty-Two Cases (Lantern Demonstration).
JACK S. GUYTON and ALAN C. WOODS, Baltimore.
Discussion to be opened by WALTER F. DUGGAN, Utica, N. Y., and JOHN S. MCGAVIC, New York.
Ocular Conditions Associated with Coliform Bacteria: Certain Clinical and Experimental Considerations of Infections of the Upper Respiratory Tract with Coliform Bacteria (Lantern Demonstration).
CONRAD BERENS, New York.
Discussion to be opened by PETER C. KRONFELD, Chicago, and JOHN A. TOOMEY, Cleveland.
Superficial Punctate Parenchymatous Keratitis (Lantern Demonstration).
WILLIAM THORNWALL DAVIS, Washington, D. C.
Discussion to be opened by SANFORD R. GIFFORD, Chicago, and TRYGVE GUNDERSEN, Boston.

Demonstration Session**Demonstration of Tonometer.**

DAVID O. HARRINGTON, San Francisco.

Corneal Scleral Sutures (Lantern Demonstration).

SAMUEL G. HIGGINS, Milwaukee.

Friday, June 6—2 p. m.

Executive Session**Election of Officers****Hereditary Glaucoma in Three Generations of a Family (Lantern Demonstration).**THOMAS D. ALLEN and WALTER G. ACKERMAN, Chicago.
Discussion to be opened by WILLIAM H. STOKES, Omaha,
and PAUL A. CHANDLER, Boston.**Tonometric Standardization: A Contribution to the Accuracy of Tonometry Through a Method of Reducing Its Variables to Constants and Minimizing Its Errors Through Refinement and Standardization of the Tonometer (Lantern Demonstration).**

DAVID O. HARRINGTON, San Francisco.

Discussion to be opened by JONAS S. FRIEDENWALD,
Baltimore, and T. L. TERRY, Boston.**Ocular Torticollis: Differential Diagnosis (Lantern Demonstration).**

LOREN PRITCHARD GUY, New York.

Discussion to be opened by A. D. RUEDEMANN, Cleveland, and DON MARSHALL, Kalamazoo, Mich.

Paralysis of the Superior Rectus and Inferior Oblique of the Same Eye (Lantern Demonstration).

JAMES W. WHITE, New York.

Discussion to be opened by JOHN B. HITZ, Milwaukee, and WALTER B. LANCASTER, Hanover, N. H.

Fusional Movements in Permanent Strabismus: A Study of the Role of the Central and Peripheral Retinal Regions in the Act of Binocular Vision in Squint (Lantern Demonstration).

HERMANN M. BURIAN, Hanover, N. H.

Discussion to be opened by WALTER HENRY FINK,
Minneapolis, and AVERY M. HICKS, San Francisco.**SECTION ON LARYNGOLOGY, OTOTOLOGY
AND RHINOLOGY**

MEETS IN BALL ROOM OF HOTEL HOLLENDEN

OFFICERS OF SECTION

Chairman—LEROY A. SCHALL, Boston.

Vice Chairman—W. E. GROVE, Milwaukee.

Secretary—LOUIS H. CLERF, Philadelphia.

Executive Committee—H. MARSHALL TAYLOR, Jacksonville, Fla.; ARTHUR W. PROETZ, St. Louis; LEROY A. SCHALL, Boston.

Wednesday, June 4—9 a. m.

The Influence of Expectorants and Gases on Sputum and the Mucous Membranes of the Tracheobronchial Tree (Lantern Demonstration).

PAUL H. HOLINGER, Chicago.

Discussion to be opened by JULIUS H. HESS, Chicago.

The Relation of Tonsillectomy to Poliomyelitis (Lantern Demonstration).

ERNEST M. SEYDELL, Wichita, Kan.

Discussion to be opened by HARRIS P. MOSHER, Marblehead, Mass., and T. E. CARMODY, Denver.

Problems of the Hard of Hearing in Industry.

W. E. GROVE, Milwaukee.

Discussion to be opened by HORACE NEWHART, Minneapolis, and C. H. McCASKEY, Indianapolis.

Acute Laryngotracheobronchitis.

F. E. LEJEUNE and P. J. BAYON, New Orleans.

Discussion to be opened by HENRY B. ORTON, Newark, N. J., and LYMAN G. RICHARDS, Boston.

The Use of Iodized Oil in the Treatment of Nasal Antrum Infections (Lantern Demonstration).

HENRY M. GOODYEAR, Cincinnati.

Discussion to be opened by ARTHUR W. PROETZ, St. Louis; O. E. VAN ALYEA, Chicago, and PAUL M. MOORE JR., Cleveland.

Thursday, June 5—9 a. m.

Chairman's Address: The Treatment of Staphylococcal Cavernous Sinus Thrombophlebitis (Lantern Demonstration).

LEROY A. SCHALL, Boston.

Principles of Chemotherapy (Lantern Demonstration).

WILLIAM D. PROVINCE, New York.

Discussion to be opened by GEORGE E. SHAMBAUGH JR., Chicago, and EDWARD D. KING, Cincinnati.

Ozena (Lantern Demonstration).

M. M. CULLOM, Nashville, Tenn.

Discussion to be opened by JOSEPH C. BECK, Chicago, and J. MILTON ROBB, Detroit.

Atypical Nasal Allergy (Lantern Demonstration).

FRENCH K. HANSEL, St. Louis.

The Relationship of Otolaryngology to Allergy (Lantern Demonstration).

FLETCHER D. WOODWARD and OSCAR SWINEFORD JR., Charlottesville, Va.

Discussion on papers of DR. HANSEL and DR. WOODWARD and SWINEFORD to be opened by GRAFTON TYLER BROWN, Washington, D. C.; J. ALEXANDER CLARKE JR., Philadelphia, and T. C. GALLOWAY, Evanston, Ill.

Friday, June 6—9 a. m.

Election of Officers**Diseases of the Salivary Glands (Lantern Demonstration).**

A. C. FURSTENBERG, Ann Arbor, Mich.

Discussion to be opened by ROBERT F. RIDPATH, Philadelphia; WALTER B. HOOVER, Boston, and GORDON B. NEW, Rochester, Minn.

Thrombosis of the Lateral Sinus: An Analysis of Results Obtained in One Hundred and Nineteen Cases (Lantern Demonstration).

LOUIS HUBERT, New York.

Discussion to be opened by GEORGE M. COATES, Philadelphia, and FRED W. DIXON, Cleveland.

The Technic of Bronchography and a System of Bronchial Nomenclature (Lantern Demonstration).

RALPH ADAMS and LOWRY F. DAVENPORT, Boston.

Discussion to be opened by MILLARD F. ARBUCKLE, St. Louis; J. J. SINGER, Los Angeles, and CHEVALIER L. JACKSON, Philadelphia.

Prophylaxis of the Common Cold.

THEODORE E. WALSH, St. Louis.

Discussion to be opened by JOHN J. SHEA, Memphis, Tenn., and ANDERSON C. HILDING, Duluth, Minn.

Rhinoplasty and Its Relation to Rhinology (Lantern Demonstration).

GEORGE D. WOLF, New York.

Discussion to be opened by SAMUEL SALINGER, Chicago; VILRAY P. BLAIR, St. Louis, and MYRON F. METZENBAUM, Cleveland.

SECTION ON PEDIATRICSMEETS IN BALL ROOM, FOURTH FLOOR, CLEVELAND
PUBLIC AUDITORIUM**OFFICERS OF SECTION**

Chairman—JULIUS H. HESS, Chicago.

Vice Chairman—JOHN A. TOOMEY, Cleveland.

Secretary—HUGH L. DWYER, Kansas City, Mo.

Executive Committee—EDWARD CLAY MITCHELL, Memphis, Tenn.; ALBERT D. KAISER, Rochester, N. Y.; JULIUS H. HESS, Chicago.

Wednesday, June 4—2 p. m.

Prognosis of Acute Hemorrhagic Nephritis in Children (Lantern Demonstration).

JOHN DORSEY CRAIG, New York.

Discussion to be opened by ADOLPH G. DESANCTIS, New York.

Spontaneous Pneumomediastinum of the Newborn Infant (Lantern Demonstration).

BERNARD GUMBINER, Chicago.

Discussion to be opened by C. C. MACKLIN, London, Canada, and WILLIAM E. ANSPACH, Chicago.

Burns in Children: Analysis of Two Hundred Cases (Lantern Demonstration).

H. JERRY LAVENDER, Cincinnati.

Discussion to be opened by R. H. ALDRICH, Boston, and ADALBERT G. BETTMAN, Portland, Ore.

Evaluation of Vitamin B Blood Level as an Indicator of Vitamin A Deficiency in Infants and in Children (Lantern Demonstration).

J. M. LEWIS, OSCAR BODANSKY and CHARLES HAIG, New York.

Discussion to be opened by ARTHUR F. ABT, Chicago, and NORMAN H. JOLLIFFE, New York.

Twenty Years' Observation on 1,438 Children with Rheumatic Heart Disease (Lantern Demonstration).
ALEXANDER T. MARTIN, New York.
Discussion to be opened by WILLIAM D. STROUD, Philadelphia.

The Intramedullary Route for the Parenteral Administration of Blood and Other Fluids (Lantern and Motion Picture Demonstration).
L. M. TOCANTINS, JAMES F. O'NEILL and H. W. JONES, Philadelphia.

Parallel Clinical and Electroencephalographic Improvement in Epilepsy: A Study of Children Treated by the Ketogenic Diet (Lantern Demonstration).

E. KOST SHELTON, Los Angeles.

Hyperthyroidism in Childhood (Lantern Demonstration).
ROGER L. J. KENNEDY, Rochester, Minn.

Endocrine Factors Influencing Growth (Lantern Demonstration).
A. WILMOT JACOBSEN, Buffalo.

Gynecologic Problems of Adolescence. EMIL NOVAK, Baltimore.
Adiposogenital Dystrophies (Lantern Demonstration).
RALPH H. KUNSTADTER, Chicago.

Endocrine Treatment of Cryptorchism (Lantern Demonstration).
WILLARD O. THOMPSON, Chicago.

Acne of Adolescence (Lantern Demonstration).
RICHARD L. SUTTON JR., Kansas City, Mo.
Discussion to be opened by THEODORE O. ELTERICH, Pittsburgh, and E. PERRY McCULLAGH, Cleveland.

Friday, June 6—9 a. m.

JOINT MEETING WITH SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH
IN SOUTH HALL A, SECOND FLOOR,
CLEVELAND PUBLIC AUDITORIUM

HAVEN EMERSON, New York, Chairman

School Health Policies. CHARLES C. WILSON, Hartford, Conn.
Uses and Abuses of School Physical Examinations.
BENJAMIN M. SPOCK, New York.

Eye Examinations in Public Schools (Lantern Demonstration).
HARRY S. GRADLE, Chicago.

Communicable Disease Control.
GEORGE M. WHEATLEY, Plandome, Long Island, N. Y.

SECTION ON PHARMACOLOGY AND THERAPEUTICS

MEETS IN CLUB ROOM B, THIRD FLOOR, CLEVELAND PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—C. M. GRUBER, Philadelphia.
Vice Chairman—WALLACE M. YATER, Washington, D. C.
Secretary—EDGAR V. ALLEN, Rochester, Minn.
Executive Committee—ERWIN E. NELSON, New Orleans; IRVING S. WRIGHT, New York; C. M. GRUBER, Philadelphia.

Wednesday, June 4—2 p. m.

Blood Pressure Determinations of Patients with Hypertension (Lantern Demonstration). DAVID AYMAN, Boston.

Treatment of Hypertension with Potassium Thiocyanate (Lantern Demonstration).
M. HERBERT BARKER and HOWARD A. LINDBERG, Chicago, and MAURICE H. WALD, Winnetka, Ill.
Discussion on papers of DR. AYMAN and DRS. BARKER, LINDBERG and WALD to be opened by N. W. BARKER, Rochester, Minn.; JOHN R. WILLIAMS, Winston-Salem, N. C., and JOHNSON MCGUIRE, Cincinnati.

Treatment of Arthritis with Gold Compounds (Lantern Demonstration).
EDWARD F. HARTUNG, New York.
Discussion to be opened by CHARLES H. SLOCUMB, Rochester, Minn., and RUSSELL L. CECIL, New York.

Treatment of Neurologic Disorders with Vitamins (Lantern Demonstration). NORMAN H. JOLLIFFE, New York.

Diagnosis and Treatment of Mild Vitamin Deficiencies.
TOM D. SPIES, Cincinnati.

Discussion on papers of DRs. JOLLIFFE and SPIES to be opened by F. P. MOERSCH, Rochester, Minn.; I. S. WECHSLER, New York, and C. A. MILLS, Cincinnati.

Treatment of the Menopause: Evaluation of Estrogen Implantation (Lantern Demonstration).

UDALL J. SALMON, New York.
Discussion to be opened by GERSON R. BISKIND, San Francisco.

Treatment of Acute Nephritis: Outcome in Ten Years in Eighty-Nine Cases (Lantern Demonstration).

FRANCIS D. MURPHY and BRUNO J. PIETRASZEWSKI, Milwaukee.

Discussion to be opened by N. M. KEITH, Rochester, Minn., and MOSES BARRON, Minneapolis.

Thursday, June 5—2 p. m.

Election of Officers

Chairman's Address: Some Differences in Actions of the Barbiturates and Thiobarbiturates When Administered to Man and Experimental Animals (Lantern Demonstration).
C. M. GRUBER, Philadelphia.

Some Effects of Potassium Salts in Man (Lantern Demonstration).

N. M. KEITH, A. E. OSTERBERG and H. B. BURCHELL, Rochester, Minn.

Discussion to be opened by M. HERBERT BARKER, Chicago, and J. M. HAYMAN, Cleveland.

Neoarsphenamine in the Therapy of Bacterial Infections (Lantern Demonstration). EDWIN E. OSGOOD, Portland, Ore.

Discussion to be opened by LOUIS N. KATZ, Chicago.

Copper and Iron in Human Blood (Lantern Demonstration).
ADOLPH SACHS, VICTOR E. LEVINE and AGNES SCHMIT, Omaha.

Treatment of Polycythemia Vera with Lead Compounds (Lantern Demonstration).

ERNEST H. FALCONER, San Francisco.
Discussion on papers of DRs. SACHS, LEVINE and SCHMIT and DR. FALCONER to be opened by CARL V. MOORE, St. Louis, and HOWARD L. ALT, Chicago.

The Utilization and Effect of Added Dextrose in Cases of Controlled and Uncontrolled Diabetes (Lantern Demonstration). JAMES A. GREENE and L. W. SWANSON, Iowa City.
Discussion to be opened by H. O. MOSENTHAL, New York.

Therapeutic Effect of Diaminosulfone Glucoside on Experimental Tuberculosis (Lantern Demonstration).
W. H. FELDMAN and H. C. HINSHAW, Rochester, Minn.

Friday, June 6—9 a. m.

JOINT MEETING WITH SECTION ON PRACTICE OF MEDICINE IN BALL ROOM, FOURTH FLOOR, CLEVELAND PUBLIC AUDITORIUM

The "Anoxemia Test" as an Index of the Coronary Reserve: Serial Observations in Patients with Their Application to the Detection and Clinical Course of Coronary Insufficiency (Lantern Demonstration).

ROBERT L. LEVY, JAMES E. PATTERSON, THOMAS W. CLARK and HOWARD G. BRUNN, New York.

Discussion to be opened by ROY W. SCOTT, Cleveland, and ARLIE R. BARNES, Rochester, Minn.

The Sudden Death of Patients with Few Symptoms of Heart Disease (Lantern and Motion Picture Demonstration).

GEORGE V. LEBOY and S. S. SNIDER, Chicago.

Physical Therapy in Internal Medicine (Lantern Demonstration).
GEORGE MORRIS PIERSON, Philadelphia.

Therapeutic Efficiency of a Digitalis Glucoside, Digilanid C, in Congestive Heart Failure with Normal Sinus Rhythm (Lantern Demonstration).

GEORGE E. FAHR and J. S. LA DUE, Minneapolis.
Discussion to be opened by ARLIE R. BARNES, Rochester, Minn.

Chemotherapy of Pneumonias and Immunity Reactions (Lantern Demonstration). JESSE G. M. BULLOWA, New York.
Discussion to be opened by WILLIAM H. KELLEY, Charleston, S. C.; LYNN T. HALL, Omaha; JOHN W. BROWN, San Francisco, and ELMER H. LOUGHLIN, Brooklyn.
Elimination Diets (Lantern Demonstration).

ALBERT H. ROWE, Oakland, Calif.

SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN CLUB ROOM B, THIRD FLOOR, CLEVELAND PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—CARL J. WIGGERS, Cleveland.
Vice Chairman—J. P. SIMONDS, Chicago.
Secretary—J. J. MOORE, Chicago.
Executive Committee—M. B. VISSCHER, Minneapolis; FRANK W. HARTMAN, Detroit; CARL J. WIGGERS, Cleveland.

Wednesday, June 4—9 a. m.

Chairman's Address: The Applicability of Experimental Results to the Shock Problem in Man (Lantern Demonstration). CARL J. WIGGERS, Cleveland.

The Problem of Blood Coagulation. WILLIAM H. HOWELL, Baltimore.
The Applied Physiology of Bile Secretion and Bile Salt Therapy (Lantern Demonstration).

ANDREW C. IVY, Chicago.
The Liver and Medical Progress (Lantern Demonstration).

FRANK C. MANN, Rochester, Minn.
The Hormones of the Adrenal Cortex (Lantern Demonstration).

FRANK A. HARTMAN, Columbus, Ohio.
Cerebral Function in Aviation (Lantern Demonstration).

JOHN F. FULTON, New Haven, Conn.
Contributions of Physiology to Medicine: Electroencephalography (Lantern Demonstration).

HALLOWELL DAVIS, Boston.

Thursday, June 5—9 a. m.

Further Studies on Mesonephroma of the Ovary (Lantern Demonstration). HOWARD W. JONES, Baltimore.

Bronchiogenic Carcinoma: Its Incidence in the Pacific Northwest Together with a Commentary on Eighty-Four Instances in the Department of Pathology at the University of Oregon (Lantern Demonstration).

FRANK R. MENNE, Portland, Ore.
Carcinoma of the Jejunum and Ileum (Lantern Demonstration).

J. SHELTON HORSLEY, Richmond, Va.
Carcinoma of the Prostate: Correlation of Clinical Course with Histopathology (Lantern Demonstration).

NEWTON G. EVANS and ALBERT F. BROWN, Los Angeles.
Factors Influencing Estrogenic Mammary Cancer (Lantern Demonstration). CHARLES F. GESCHICKTER, Baltimore.

Histologic Changes in the Ovary Following Administration of Gonadotropin (Lantern Demonstration).

ROBERT B. GREENBLATT, Augusta, Ga.

Friday, June 6—9 a. m.

Election of Officers

The Advantages and Clinical Uses of Desiccated Plasma Prepared by the Adtevac Process (Lantern and Motion Picture Demonstration). J. M. HILL, Dallas, Texas.

The Role of the External Secretion of the Pancreas in the Prevention of Fatty Infiltration of the Liver (Lantern Demonstration).

M. LAURENCE MONTGOMERY, San Francisco, and I. L. CHAIKOFF, Berkeley, Calif.

Dietary Production of Fatty and Cirrhotic Livers, with a Study of the Specific Factor Involved.

M. A. SPELLBERG and ROBERT W. KEETON, Chicago.
Alimentary Azotemia and the Bleeding Peptic Ulcer Syndrome (Lantern Demonstration).

HENRY N. HARKINS, C. FRANK CHUNN and ROBERT T. BOALS, Detroit.

The Pathogenesis of Hemolytic Anemia (Lantern Demonstration).

WILLIAM DAMESHEK and EDWARD B. MILLER, Boston.

A Concrete Classic Demonstration of Two Separate Specific Immune Phenomena in Tuberculosis (Lantern Demonstration). H. J. CORPER and MAURICE L. COHN, Denver.

Reductions in Blood Pressures of Renal Hypertensive Dogs by Hog Renin (Lantern Demonstration).

G. E. WAKERLIN and C. A. JOHNSON, Chicago.

SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN LITTLE THEATER, ARENA FLOOR, CLEVELAND PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—TOM B. THROCKMORTON, Des Moines, Iowa.

Vice Chairman—TITUS H. HARRIS, Galveston, Texas.

Secretary—J. M. NIELSEN, Los Angeles.

Executive Committee—FRANCIS C. GRANT, Philadelphia; PAUL C. BUCY, Chicago; TOM B. THROCKMORTON, Des Moines, Iowa.

Wednesday, June 4—2 p. m.

Alcohol and the Food, Drug and Cosmetic Act: A Proposal for Changes in Present Methods of Sale of Alcoholic Beverages to Conform with the Federal Food, Drug and Cosmetic Act.

LEO ALEXANDER, MERRILL MOORE and ABRAHAM MYERSON, Boston.

Discussion to be opened by PHILIP E. PIKER, Cincinnati, and LAWRENCE KOLB, Washington, D. C.

Some Mental Mechanisms in Alcoholism (Lantern Demonstration). F. GARM NORBURY, Jacksonville, Ill.

Discussion to be opened by LLOYD H. ZIEGLER, Wauwatosa, Wis., and G. WILSE ROBINSON JR., Kansas City, Mo.

Chairman's Address (Lantern Demonstration).

TOM B. THROCKMORTON, Des Moines, Iowa.

Fractures of the Spine with Spinal Cord Injury (Lantern Demonstration).

S. BERNARD WORTIS and LEWIS I. SHARP, New York.

Discussion to be opened by F. C. GRANT, Philadelphia, and LEWIS J. POLLOCK, Chicago.

An Evaluation of Emotional Factors in Neurodermatitis (Lantern Demonstration).

MAURICE H. GREENHILL, Durham, N. C., and JACOB E. FINESINGER, Boston.

Discussion to be opened by C. GUY LANE, Boston, and SAMUEL W. BECKER, Chicago.

Neuromuscular Disorders: Results of Vitamin E Therapy (Lantern Demonstration).

C. HUNTER SHELLEN, Pasadena, Calif.

Vitamin E and Alpha-Tocopherol Therapy in Neuromuscular and Muscular Disorders.

RUSSELL N. DEJONG, Ann Arbor, Mich.

Discussion on papers of Drs. SHELLEN and DEJONG to be opened by HENRY W. WOLTMAN, Rochester, Minn., and I. S. WECHSLER, New York.

Thursday, June 5—2 p. m.

PANEL DISCUSSION ON NEUROSURGICAL TREATMENT OF CERTAIN ABNORMAL MENTAL STATES (Lantern and Motion Picture Demonstration)

PAUL C. BUCY, Chicago, Moderator.

WALTER FREEMAN, Washington, D. C.

M. A. TARUMIANZ, Farnhurst, Del.

THEODORE CHARLES ERICKSON, Montreal, Canada.

J. G. LYERLY, Jacksonville, Fla.

H. D. PALMER, Philadelphia.

ROY R. GRINKER, Chicago.

Friday, June 6—2 p. m.

Election of Officers

The Diagnosis and Management of Subarachnoid Hemorrhage (Lantern Demonstration). IRVING J. SANNS, Brooklyn.

Discussion to be opened by J. R. JAEGER, Denver, and W. JAMES GARDNER, Cleveland.

Induction of Metrazol Convulsions Under Nitrous Oxide Anesthesia (Motion Picture Demonstration).

HOWARD D. FABING, Cincinnati.

Discussion to be opened by PHILIP E. PIKER, Cincinnati, and A. E. BENNETT, Omaha.

Spontaneous Convulsions Following Metrazol Treatment (Lantern Demonstration). ERICH LIEBERT, Elgin, Ill.

Discussion to be opened by ROY R. GRINKER, Chicago.

Electrically Induced Convulsions in the Treatment of Functional Disorders (Motion Picture Demonstration).

DAVID JOHN IMPASTATO, New York.

Discussion to be opened by WALTER FREEMAN, Washington, D. C., and S. BERNARD WORTIS, New York.

Diagnostic and Prognostic Value of the Electroencephalogram (Lantern Demonstration). FREDERIC A. GIBBS, Boston.

Discussion to be opened by E. J. Baldes, Rochester, Minn.

Microcystometry and Sphincterometry in the Study and Treatment of Neurologic Diseases (Lantern Demonstration).

IRVING SIMONS, New York.

Discussion to be opened by V. ROGERS DEAKIN, St. Louis, and E. L. BRODIE, Buffalo.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN SOUTH HALL C, FOURTH FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—J. GARDNER HOPKINS, New York.

Vice Chairman—EDWARD A. OLIVER, Chicago.

Secretary—C. F. LEHMANN, San Antonio, Texas.

Executive Committee—BEDFORD SHELMIER, Dallas, Texas;
JOHN G. DOWNING, Boston; J. GARDNER HOPKINS, New York.

Wednesday, June 4—2 p. m.

Chairman's Address: The Training of a Dermatologist.

J. GARDNER HOPKINS, New York.

Cancer of the Lower Lip: Review of Three Hundred and Eighteen Cases Treated with Radiation (Lantern Demonstration).

JOHN H. LAMB and WILLIAM E. EASTLAND, Oklahoma City.

Discussion to be opened by JAMES R. DRIVER, Cleveland, and JOHN W. SPELLMAN, Brookline, Mass.

Poikiloderma-like Changes in the Skin Following Arsphenamine Dermatitis (Lantern Demonstration).

A. BENSON CANNON and MARIE B. KARELITZ-KARRY, New York.

Discussion to be opened by CLYDE L. CUMMER and JOHN E. RAUSCHKOLB, Cleveland.

A Comparative Study of Necrobiosis Lipoidica and Granuloma Annulare (Lantern Demonstration).

FRANCIS A. ELLIS, Baltimore, and HAYDEN KIRBY-SMITH, Washington, D. C.

Discussion to be opened by FRED D. WEIDMAN, Philadelphia.

Comparison of Frei Antigens (Lantern Demonstration).

HARRY M. ROBINSON and HARRY M. ROBINSON JR., Baltimore.

Discussion to be opened by HERMAN BEERMAN, Philadelphia.

False Positive Serologic Reactions for Syphilis Due to Small-pox Vaccinations (Vaccinia) (Lantern Demonstration).

FRANCIS W. LYNCH, St. Paul, and ANNE C. KIMBALL and RUTH E. BOYNTON, Minneapolis.

Discussion to be opened by FRANCIS EUGENE SENEAR, Chicago.

Herpes Simplex Following Artificial Fever Therapy: Small-pox Vaccination as a Factor in the Prevention of Herpes Simplex Occurring After Artificial Fever Therapy.

FRANCES M. KEDDIE, R. B. REES JR. and NORMAN N. EPSTEIN, San Francisco.

Discussion to be opened by ARTHUR G. SCHOCH, Dallas, Texas.

Thursday, June 5—2 p. m.

Intraspinal Therapy of Neurosyphilis (Lantern Demonstration).

ROBERT R. KIERLAND and PAUL A. O'LEARY, Rochester, Minn.

Discussion to be opened by HAROLD N. COLE, Cleveland.

Further Experiences with the Massive Dose Chemotherapy of Early Syphilis by the Intravenous Drip Method (Lantern Demonstration).

WILLIAM LEIFER, LOUIS CHARGIN and HAROLD THOMAS HYMAN, New York.

An Evaluation of the Massive Dose Therapy of Syphilis.

D. C. ELLIOTT, Chicago; GEORGE BAEHR, New York; LOREN W. SHAFFER, Detroit, and GLENN S. USHER and S. ALLAN LOUGH, Washington, D. C.

Discussion to be opened by EVAN W. THOMAS, New York, and HERBERT RATNER, Chicago.

Rocky Mountain Spotted Fever (Lantern Demonstration).

JACK G. HUTTON, Denver.
Discussion to be opened by ROBERT J. BAILEY, Spokane, Wash.

Verrucae Planae and Epithelial Nevi (Lantern Demonstration).
MORRIS WAISMAN, Chicago, and HAMILTON MONTGOMERY, Rochester, Minn.

Discussion to be opened by MARCUS RAYNER CARO, Chicago.

Dermatosis Dyskeratoidis (Lantern Demonstration).

SAMUEL B. FRANK and CHARLES R. REIN, New York.

Discussion to be opened by M. H. GOODMAN, Baltimore;

WILLIAM HOWARD HAILEY, Atlanta, Ga., and NELSON

PAUL ANDERSON, Los Angeles.

Friday, June 6—2 p. m.

Election of Officers

Nutritional Dermatoses in Rats: VI. Signs and Symptoms Resulting from an Otherwise Normal Diet Containing Uncooked Egg White as the Sole Source of Protein (Lantern and Motion Picture Demonstration).

MAURICE SULLIVAN and JANE NICHOLLS, Baltimore.

Discussion to be opened by PAUL GYORGY, Cleveland.

Nummular Eczema: Its Clinical Picture and Successful Therapy (Lantern Demonstration).

PAUL GROSS, New York.

Discussion to be opened by SAMUEL W. BECKER, Chicago.

Rational Prescription Writing in Dermatology.

HERMAN GOODMAN, New York.

Discussion to be opened by TORALD H. SOILMANN, Cleveland.

Xanthoma Tuberosum: Report of a Family with Cutaneous Xanthomatosis, Hypercholesteremia, Cardiac Symptoms and Sudden Death, Combined or Alone in Several Members; Report of Autopsy in One.

DAVID BLOOM, New York, and SAMUEL R. KAUFMAN and RUSSELL A. STEVENS, Wilkes-Barre, Pa.

Discussion to be opened by THEODORE CORNBLEET, Chicago.

Hormone Therapy in Tinea Capitis (Lantern Demonstration).

DUNCAN O. POTI and SIDNEY R. KALISKI, San Antonio, Texas.

Discussion to be opened by GEORGE M. LEWIS, New York.

SECTION ON PREVENTIVE AND INDUS- TRIAL MEDICINE AND PUBLIC HEALTH

MEETS IN SOUTH HALL A, SECOND FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—CLARENCE D. SELBY, Detroit.

Vice Chairman—HUNTINGTON WILLIAMS, Baltimore.

Secretary—W. A. SAWYER, Rochester, N. Y.

Executive Committee—I. C. RIGGIN, Richmond, Va.; HAROLD S. DIEHL, Minneapolis; CLARENCE D. SELBY, Detroit.

Wednesday, June 4—9 a. m.

Methods by Which the State Participates in Health Services.
JOSEPH W. MOUNTIN, Washington, D. C.

A Clinical Analysis of Fifteen Thousand Cases of Pneumonia: An Evaluation of the Effectiveness of Various Therapeutic Agents (Lantern Demonstration).

DALE C. STAHL, Harrisburg, Pa.

Correlation of Roentgenographic and Pathologic Observations in Pneumoconiosis (Lantern Demonstration).

LEWIS GREGORY COLE, White Plains, N. Y.

Tuberculosis Among Nursing Students at the Philadelphia General Hospital (Lantern Demonstration).

HAROLD L. ISRAEL, Philadelphia.

A Practical and Successful Tuberculosis Case-Finding Program for Nonmetropolitan Areas.

THEODORE L. BLISS, Akron, Ohio.

Thursday, June 5—9 a. m.

Election of Officers

Chairman's Address.

CLARENCE D. SELBY, Detroit.

The Environmental Control of Epidemic Contagion. Study I: Schools.

W. F. WELLS, M. W. WELLS and T. S. WILDER, Philadelphia.

Recent Investigations on Gonococcal Vaginitis (Lantern Demonstration).

JOHN L. RICE, ALFRED COHN, ARTHUR STEER and ELEANOR L. ADLER, New York.

Interns and Their Health (Lantern Demonstration).

REGINALD FITZ, Boston.

Occupational Hazards of the Business Executive (Lantern Demonstration). EDGAR V. ALLEN, Rochester, Minn.

U. S. Government Meat Inspection After a Third of a Century (Motion Picture Demonstration).

W. H. LIPMAN, Chicago.

Friday, June 6—9 a. m.

JOINT MEETING WITH SECTION ON PEDIATRICS

HAVEN EMERSON, New York, Chairman.

School Health Policies. CHARLES C. WILSON, Hartford, Conn.

Uses and Abuses of School Physical Examinations.

BENJAMIN M. SPOCK, New York.

Eye Examinations in Public Schools (Lantern Demonstration).

HARRY S. GRADLE, Chicago.

Communicable Disease Control.

GEORGE M. WHEATLEY, Plandome, Long Island, N. Y.

SECTION ON UROLOGY

MEETS IN SOUTH HALL C, FOURTH FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—MEREDITH F. CAMPBELL, New York.

Vice Chairman—L. F. HUFFMAN, Cleveland.

Secretary—VINCENT J. O'CONOR, Chicago.

Executive Committee—WILLIAM P. HERBST, Washington, D. C.; FREDERIC E. B. FOLEY, St. Paul; MEREDITH F. CAMPBELL, New York

Wednesday, June 4—9 a. m.

Cytometry: Its Value and Limitations.

MICHAEL K. O'HEERON, Houston, Texas.

Bladder Difficulties in the Tabetic Patient with Special Reference to Surgical Treatment by Transurethral Resection.

JOHN L. EMMETT and J. B. BEARE, Rochester, Minn.

Discussion to be opened by WILLIAM P. HERBST, Washington, D. C.; HERBERT ELLIS LANDES, Chicago, and DALTON KEATS ROSE, St. Louis.

The Physiologic Basis of the Neurogenic Bladder (Lantern Demonstration).

JOSEPH P. EVANS, Cincinnati.

Presacral Neurectomy: Its Value and Limitations (Lantern Demonstration).

CARLISLE F. SCHROEDER, Detroit.

Surgical Treatment of the Autonomous Neurogenic Bladder (Lantern Demonstration).

REED M. NESBIT and WILLIAM G. GORDON, Ann Arbor, Mich.

Discussion to be opened by DEAN LEWIS, Baltimore, and JAMES JOEL JOELSON, Cleveland.

Thursday, June 5—9 a. m.

Chairman's Address (Lantern Demonstration).

MEREDITH F. CAMPBELL, New York.

Juvenile Hypertension in Association with Congenital and Inflammatory Lesions of the Upper Urinary Tract (Lantern Demonstration).

JOHN H. POWERS and M. F. MURRAY, Cooperstown, N. Y.

Discussion to be opened by LEO PATRICK DOLAN, Toledo, Ohio.

Fibrosis and Submucous Calcification of the Vesical Neck (Lantern Demonstration).

GEORGE M. FISTER, Ogden, Utah.

Discussion to be opened by HERBERT BEACH WRIGHT, Cleveland.

Methods and Ultimate Results in the Treatment of Tumors of the Bladder.

HUGH H. YOUNG, Baltimore.

Discussion to be opened by ARCHIE L. DEAN JR., New York; WILLIAM E. LOWER, Cleveland, and A. J. SCHOLL, Los Angeles.

The Surgical Treatment of Prostatic Disease (Lantern Demonstration).

ROY B. HENLINE, New York.

Discussion to be opened by HARRY CULVER, Chicago, and HERMON C. BUMPUS JR., Pasadena, Calif.

Renal Sympathectomy: An Evaluation of Fifteen Years' Experience (Lantern Demonstration).

ELMER HESS, Erie, Pa.

Discussion to be opened by THOMAS POLLOCK SHUPE, Cleveland, and FREDERIC E. B. FOLEY, St. Paul.

Friday, June 6—9 a. m.

Election of Officers

The Use of P-Sulfanil-Acetyl-Imide in the Treatment of E. Coli Urinary Tract Infections (Lantern Demonstration).

ROGER W. BARNES and FERDINAND WELEBIR, Los Angeles.

The Chemotherapy of Gonorrheal Urethritis (Lantern Demonstration).

WILLIAM BROMME, Detroit.

Discussion to be opened by EDWARD NOBLE COOK, Rochester, Minn., and EDWIN PASCAL ALYEA, Durham, N. C.

Modern Urologic Pharmacology (Lantern Demonstration).

J. SYDNEY RITTER, New York, and SAMUEL E. KRAMER, Perth Amboy, N. J.

The Clinical Value of the Aschheim-Zondek Test in Testicular Tumors (Lantern Demonstration).

GRAY H. TWOMBLY, HAROLD L. TEMPLE and ARCHIE L. DEAN JR., New York.

Discussion to be opened by RUSSELL D. HERROLD, Chicago.

The Principle of Traction in the Treatment of Ureteral Stone.

ROY PELHAM FINNEY, Spartanburg, S. C.

Discussion to be opened by WALTER M. KEARNS, Milwaukee, and JOHN H. MORRISSEY, New York.

The Value of Cystoscopic Photography in Medicine (Lantern Demonstration).

LOWRAIN E. MCCREA, Philadelphia.

Discussion to be opened by FLETCHER H. COLBY, Boston.

SECTION ON ORTHOPEDIC SURGERY

MEETS IN LITTLE THEATER, ARENA FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—J. ALBERT KEY, St. Louis.

Vice Chairman—JAMES A. DICKSON, Cleveland.

Secretary—GUY A. CALDWELL, New Orleans.

Executive Committee—OSCAR L. MILLER, Charlotte, N. C.; ROBERT V. FUNSTEN, Charlottesville, Va.; J. ALBERT KEY, St. Louis.

Wednesday, June 4—9 a. m.

Leg Shortening (Lantern Demonstration). M. BECKETT HOWORTH, New York.

Discussion to be opened by FREMONT A. CHANDLER, Chicago, and ALLEN F. VOSHELL, Baltimore.

Roentgen Therapy for Rhizomelic Spondylitis, from the Rackham Arthritis Research Unit, and the Department of Radiology, the Medical School, University of Michigan (Lantern and Motion Picture Demonstration).

CHARLEY J. SMYTH, RICHARD H. FREYBERG and ISADORE LAMPE, Ann Arbor, Mich.

Discussion to be opened by BERNARD I. COMROE, Philadelphia, and CARL E. BADGLEY, Ann Arbor, Mich.

Benign and Malignant Giant Cell Tumors: Diagnosis and Result of Treatment (Lantern Demonstration).

HENRY W. MEYERDING, Rochester, Minn.

Discussion to be opened by MURRAY M. COPELAND, Baltimore, and DALLAS B. PHENISTER, Chicago.

Neck Pain: Laminography as an Aid to the Diagnosis of Atlanto-Occipital Lesions (Lantern Demonstration).

FREDERICK A. JOSTES, St. Louis.

Discussion to be opened by SHERWOOD MOORE, St. Louis, and JESSE T. NICHOLSON, Philadelphia.

Vitallium Cup Arthroplasty of the Hip: A Preliminary Report on the Results in Sixteen Patients with Nineteen Arthroplasties (Lantern Demonstration).

LENOX D. BAKER and CHESTER H. WATERS JR., Durham, N. C.

Discussion to be opened by MARIUS N. SMITH-PETERSEN, Boston, and THEODORE A. WILLIS, Cleveland.

Operative Treatment of Cerebral Palsy of Spastic Type (Lantern Demonstration).

WILLIAM T. GREEN and LEO J. McDERMOTT, Boston.

Discussion to be opened by BEVERIDGE H. MOORE, Chicago, and MANUEL E. PUSITZ, Topeka, Kan.

Thursday, June 5—9 a. m.

Election of Officers

Occult Fractures (Lantern Demonstration).

ROLAND HAMMOND, Providence, R. I., and DENIS S. O'CONNOR, New Haven, Conn.

Discussion to be opened by WALTER C. HILL, Cleveland, and CHARLES N. PEASE, Chicago.

The Choice of Materials for Internal Fixation of Fractures of the Neck of the Femur (Lantern Demonstration).

EDWARD L. COMPERE, Chicago, and GEORGE T. WALLACE, Spokane, Wash.

Discussion to be opened by AUSTIN T. MOORE, Columbia, S. C., and RUDOLPH S. REICH, Cleveland.

Chairman's Address: The Use of Sulfanilamide and Sulfathiazole in Orthopedic Surgery (Lantern Demonstration).

J. ALBERT KEY, St. Louis.

Shoulder and Elbow Lesions of the Professional Baseball Pitcher (Lantern Demonstration).

GEORGE E. BENNETT, Baltimore.

Discussion to be opened by FRANK D. DICKSON, Kansas City, Mo., and CHARLES A. STONE, St. Louis.

The Supraspinatus Syndrome: Symptomatology, Pathology and Repair (Lantern Demonstration).

DAVID M. BOSWORTH, New York.

Discussion to be opened by I. WILLIAM NACHLAS, Baltimore, and JOSEPH J. KURLANDER, Cleveland.

The Treatment of Acute Osteomyelitis by Sulfathiazole Without Operation (Lantern Demonstration).

WALTER A. HOYT and ADRIAN E. DAVIS, Akron, Ohio.

Discussion to be opened by RICHARD B. RANEY, Durham, N. C., and ABRAHAM O. WILENSKY, New York.

Friday, June 6—9 a. m.

JOINT MEETING WITH THE SECTION ON SURGERY,
GENERAL AND ABDOMINAL

The Mechanism of Delayed Wound Healing in the Presence of Hypoproteinemia (Lantern Demonstration).

JONATHAN E. RHOADS and M. T. FLIEGELMAN, Philadelphia.

Discussion to be opened by I. S. RAVDIN, Philadelphia, and CHARLES G. JOHNSTON, Detroit.

Similarities and Distinctions Between Shock and the Effects of Hemorrhages (Lantern Demonstration).

VIRGIL H. MOON, D. R. MORGAN, M. M. LIEBER and DONALD J. MCGREW, Philadelphia.

Discussion to be opened by LESTER R. DRAGSTEDT, Chicago.

Traumatic Rupture of the Intestine Due to Nonpenetrating Wounds of the Abdomen (Lantern Demonstration).

D. HENRY POER and IRA A. FERGUSON, Atlanta, Ga., and EDWARD WOLIVER, Cincinnati.

Fresh Compound Fractures: Treatment by Sulfa-Drugs and by Internal Fixation in Selected Cases (Lantern Demonstration).

WILLIS C. CAMPBELL and HUGH SMITH, Memphis, Tenn.

Discussion to be opened by WALTER G. STERN, Cleveland, and HAROLD R. BOHLMAN, Baltimore.

The Splinting of Compound Fractures (Lantern Demonstration).

FRANK J. COX, New Orleans.

Discussion to be opened by PHILIP D. WILSON, New York, and ROGER ANDERSON, Seattle.

Chemotherapy in the Treatment of Compound Fractures (Lantern and Motion Picture Demonstration).

REX L. DIVELEY, Kansas City, Mo.

Discussion to be opened by FRANCIS M. MCKEEVER, Los Angeles, and ROBERT W. JOHNSON JR., Baltimore.

**SECTION ON GASTRO-ENTEROLOGY
AND PROCTOLOGY**

MEETS IN SOUTH HALL A, SECOND FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—FRANK C. YEOMANS, New York.

Vice Chairman—WALTER L. PALMER, Chicago.

Secretary—J. A. BARGEN, Rochester, Minn.

Executive Committee—DESCUM C. MCKENNEY, Buffalo; A. H. AARON, Buffalo; FRANK C. YEOMANS, New York.

The annual banquet of the section will be held on Wednesday, June 4, 7 p. m., at the Hotel Cleveland.

Wednesday, June 4—2 p. m.

SYMPOSIUM ON MOUTH LESIONS

Halitosis (Lantern Demonstration).

BURRILL BERNARD CROHN, New York.

Lesions of the Mouth Associated with Deficiency Diseases (Lantern Demonstration).

LOUIS A. ROSENBLUM, New York.

Observations on Human Dental Caries (Lantern Demonstration).

BENJAMIN F. MILLER, Chicago.

Discussion to be opened by THOMAS T. MACKIE, New York.

**PANEL DISCUSSION ON DRUG THERAPY IN
THE ALIMENTARY TRACT**

SARA M. JORDAN, Boston, Chairman.

Control of Gastrointestinal Function by Centrally Acting Drugs (Lantern Demonstration).

DONALD H. SLAUGHTER, Dallas, Texas.

Control of Gastrointestinal Function by Drugs Acting Peripherally (Lantern Demonstration).

HARRY GOLD, New York.

Harmful Effects of Mineral Oil Purgatives.

JAMES W. MORGAN, San Francisco.

The Chemotherapy of Intestinal Parasites.

ERNEST CARROLL FAUST, New Orleans.

Thursday, June 5—2 p. m.

Chairman's Address. Proctology: Its Field and Qualifications.
FRANK C. YEOMANS, New York.

LESIONS OF THE RECTUM AND LARGE INTESTINE

Morbidity and Mortality After Resections of the Rectum (Lantern Demonstration).

MONTAGUE S. WOOLF, San Francisco.

Squamous Cell Carcinomas of the Anorectal Region (Lantern Demonstration).

JACK G. KERR, Dallas, Texas.

The Colostomy Question (Lantern Demonstration).

LOUIS J. HIRSCHMAN, Detroit.

Discussion to be opened by NEIL W. SWINTON, Boston; G. JOHNSON HAMILTON, New York; CLEMENT L. MARTIN, Chicago; DESCUM C. MCKENNEY, Buffalo; THOMAS E. JONES, Cleveland; WILLIAM H. DANIEL, Los Angeles, and C. ALEXANDER HELLWIG, Wichita, Kan.

Resection of the Right Colon for Nonspecific Ileocolitis (Lantern Demonstration).

CHARLES W. MAYO and EDWARD STARR JUDD JR., Rochester, Minn.

Discussion to be opened by MAX THOREK, Chicago.

Studies on Lymphopathia Venereum Infections of the Rectum (Lantern Demonstration).

ENID RODANICHE, JOSEPH BARNETT KIRSNER and WALTER L. PALMER, Chicago.

Discussion to be opened by HERBERT T. HAYES, Houston, Texas, and MOSES PAULSON, Baltimore.

Clinical Summary of the Management of Nine Hundred and Twelve Cases of Chronic Ulcerative Colitis (Lantern Demonstration).

MICHAEL H. STRICHER, Chicago.

Discussion to be opened by MARTIN S. KLECKNER, Allentown, Pa.; ZACHARIAS BERCOVITZ, New York; ISAAC R. JANKELSON, Boston, and ASHER WINKELSTEIN, New York.

Friday, June 6—2 p. m.

Election of Officers

The History of Vitamin C Deficiency in the South African Native (Lantern Demonstration).

HAROLD O. HOFMEYER, Capetown, Union of South Africa.

STUDIES ON THE STOMACH

Clinical Appraisal of Various Methods of Treating Bleeding Peptic Ulcer, Based on a Series of Four Hundred Cases (Lantern Demonstration).

HENRY A. RAFSKY and MICHAEL WEINGARTEN, New York.

Intractable Peptic Ulcers: Are They a Surgical or a Medical Problem (Lantern Demonstration)?

ALBERT F. R. ANDRESEN, Brooklyn.

Carcinomatous Gastric Ulcer: Misleading Results of Medical Therapy (Lantern Demonstration).

GEORGE B. EUSTERMANN, Rochester, Minn.
Discussion to be opened by NATHANIEL E. REICH, Brooklyn; JOHN DAY GARVIN, Pittsburgh; JAMES F. WEIR, Rochester, Minn.; SARA M. JORDAN, Boston, and JOHN G. MATEER, Detroit.

Kaolin Granuloma of the Stomach (Lantern Demonstration).

ALLAN L. COHN, ALFRED S. WHITE and HELEN B. S. WEYRAUCH, San Francisco.

Clinical Indications for Inducing Gastric Hypomotility (Lantern Demonstration).

FRANK E. HAMILTON and GEORGE MORRIS CURTIS, Columbus, Ohio.

Discussion to be opened by ANDREW C. IVY, Chicago, and DAVID J. SANDWEISS, Detroit.

Gastroscopic Studies in Chronic Alcoholic Addicts: Report of One Hundred Cases (Lantern Demonstration).

LEONIDAS H. BERRY, Chicago.

SECTION ON RADIOLOGY

MEETS IN SOUTH HALL B, THIRD FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—RAYMOND C. BEELER, Indianapolis.

Vice Chairman—RALPH S. BROMER, Bryn Mawr, Pa.

Secretary—JOHN T. MURPHY, Toledo, Ohio.

Executive Committee—R. G. TAYLOR, Los Angeles; MERRILL C. SOSMAN, Boston; RAYMOND C. BEELER, Indianapolis.

Wednesday, June 4—2 p. m.

The Roentgen Diagnosis of the Primary Tuberculous Infection (Lantern Demonstration).

C. C. BIRKELO, Detroit.

Treatment of Childhood Tuberculosis (Lantern Demonstration).

HORTON R. CASPARIS, Nashville, Tenn.

Advantages of Permanent Collapse Therapy in Pulmonary Tuberculosis (Lantern Demonstration).

RICHARD H. OVERHOLT, Brookline, Mass.

Gallstone Obstruction: Pathogenesis and Roentgen Manifestations (Lantern Demonstration).

LEO G. RIGLER and CHAUNCEY N. BORMAN, Minneapolis, and JOHN F. NOBLE, St. Paul.

The Effect of Roentgen Irradiation of the Epiphysis of the Albino Rat (Lantern Demonstration).

JAMES R. LINGLEY, EDWARD A. GALL and JOSEPH S. BARR, Boston.

Thursday, June 5—2 p. m.

Chairman's Address. RAYMOND C. BEELER, Indianapolis.

Relation of Vitamins to the Intestinal Tract.

THOMAS T. MACKIE, New York.

The Small Intestine in Vitamin B Deficiency (Lantern Demonstration).

ROSS GOLDEN, New York.

A Syndrome Due to Deficiency of the Vitamin B Complex (Lantern Demonstration).

MICHAEL J. LEPORE, New York.

Tumefactive Lesions of the Small Intestine (Lantern Demonstration).

C. ALLEN GOOD, Rochester, Minn.

Discussion to be opened by EUGENE P. PENDERGRASS, Philadelphia.

Friday, June 6—2 p. m.

Election of Officers**Postirradiation Changes in the Levels of Organic Phosphorus in the Blood of Patients with Leukemia (Lantern Demonstration).**

JULIUS B. ABELS, JOHN S. KENNEY and L. D. MARI-NELLI, New York.

Radiation Protection in Forty-Five Hospitals (Lantern Demonstration).

LEONARD A. SCHEELE and DEAN B. COWIE, Bethesda, Md.

Results of Radium Treatment of Cancer of the Uterine Fundus with Special Reference to the Microscopic Grade of the Lesion (Lantern Demonstration).

ROBERT E. FRICKE and CHARLES O. HEILMAN, Rochester, Minn.

Radiation Therapy in Carcinoma of the Lung (Lantern Demonstration).

WILLIAM V. TENZEL, New York.

The Influence of Radiation on Longevity in Cancer of the Breast (Lantern Demonstration).

ORVILLE N. MELAND, Los Angeles.

SECTION ON ANESTHESIOLOGY

MEETS IN SOUTH HALL B, THIRD FLOOR, CLEVELAND
PUBLIC AUDITORIUM

OFFICERS OF SECTION

Chairman—RALPH M. WATERS, Madison, Wis.

Vice Chairman—T. J. COLLIER, Atlanta, Ga.

Secretary—JOHN S. LUNDY, Rochester, Minn.

Executive Committee—JOHN H. EVANS, Buffalo; H. S. RUTH, Merion, Pa.; RALPH M. WATERS, Madison, Wis.

Wednesday, June 4—9 a. m.

Communications and Congratulations to the New Section Read by the Vice Chairman and the Secretary of the Section. Greetings.

FRANK H. LAHEY, Boston, Incoming President, American Medical Association; NATHAN B. VAN ETTEN, New York, Past President; ARTHUR W. BOOTH, Elmira, N. Y., Chairman, Board of Trustees; H. H. SHOUL-DERS, Nashville, Tenn., Speaker, House of Delegates; JAMES E. PAULLIN, Atlanta, Ga., Chairman, Council on Scientific Assembly; OLIN WEST, Chicago, Secretary and General Manager, and MORRIS FISHBEIN, Chicago, Editor, THE JOURNAL.

The Men Who Discovered Anesthesia (Lantern Demonstration).

WALTER C. ALVAREZ, Rochester, Minn.

Discussion to be opened by JOHN H. EVANS, Buffalo, and ANSEL M. CAINE, New Orleans.

History and Present Status of Oxygen Therapy and Resuscitation (Lantern Demonstration).

RALPH M. TOVELL and JOSEPH E. REMLINGER, Hartford.

Discussion to be opened by ALVAN L. BARACH, New York, and FREDERICK A. D. ALEXANDER, Albany, N. Y.

The Volatile Anesthetics: Ether, Divinyl Ether, Chloroform and Ethyl Chloride.

H. BOYD STEWART, Tulsa, Okla.

Discussion to be opened by SAMUEL JOHNSTON, Toronto, Canada, and PALUEL J. FLAGG, New York.

Thursday, June 5—9 a. m.

Chairman's Address: The Chemical Absorption of Carbon Dioxide from Anesthetic Atmospheres (Lantern Demonstration). RALPH M. WATERS, Madison, Wis.

Anesthesia for Military Needs.

ACHILLES L. TYNES, Washington, D. C.; WILLIAM W. NICHOL, San Francisco, and SIDNEY C. WIGGIN, Boston.

Discussion to be opened by GEORGE W. CRILE, Cleveland, and DOUGLAS B. KENDRICK, Washington, D. C.

Anesthesia for Surgery About the Head (Lantern Demonstration).

URBAN H. EVERSOLE, Boston.

Discussion to be opened by FREDERICK W. CLEMENT, Toledo, Ohio, and B. BURDELL SANKEY, East Cleveland, Ohio.

Intravenous Anesthesia.

PAUL W. SEARLES, Buffalo.

Discussion to be opened by ROLLAND J. WHITACRE, East Cleveland, Ohio, and GEORGE J. THOMAS, Pittsburgh.

Anesthesia and Analgesia by Ether and Various Drugs Rectally (Lantern Demonstration).

JAMES T. GWATHMEY, Donna, Texas.

Discussion to be opened by GEORGE H. SEMKEN and PAUL M. WOOD, New York.

Friday, June 6—9 a. m.

Election of Officers

Therapeutic Nerve Block. EMERY A. ROVENSTINE, New York.

Discussion to be opened by CHARLES F. MCCUSKEY, Glendale, Calif., and BRIAN C. SWORD, New York.

Serial Spinal Anesthesia (Lantern Demonstration).

HENRY S. RUTH, Merion Station, Pa., and IVAN B. TAYLOR and FREDERICK P. T. HAUGEN, Philadelphia.

Discussion to be opened by WILLIAM T. LEMMON, Philadelphia, and PHILIP D. WOODBRIDGE, New Haven, Conn.

Effects on Respiration of Morphine, Atropine and Scopolamine Alone and Combined (Lantern Demonstration).

CLAYTON P. WANGEMAN and MALCOLM H. HAWK, Madison, Wis.

Discussion to be opened by DENNIS E. JACKSON, Cincinnati, and RALPH T. KNIGHT, Minneapolis.

An Apparatus for the Automatic Recording of Diastolic and Systolic Blood Pressure in Clinical Practice (Lantern Demonstration).

HARVEY C. SLOCUM, Madison, Wis.

Discussion to be opened by CLAUDE S. BECK, Cleveland, and JOHN K. POTTER, East Cleveland, Ohio.

Effect of Certain General Anesthetic Agents on the Small Vessels of the Rabbit's Ear (Lantern Demonstration).

THOMAS H. SELDON, Rochester, Minn.

Discussion to be opened by ELIOT R. CLARK, Philadelphia, and EDGAR V. ALLEN, Rochester, Minn.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will occupy the Arena Floor of the Cleveland Public Auditorium.

In addition to groups of exhibits sponsored by the sections of the Scientific Assembly, there will be several features of interest. The Board of Trustees has authorized two special exhibits—fractures and lame backs. Emphasis is placed on national defense and war medicine, and there will be a group of exhibits dealing with these subjects. Among other items of interest, there will be a group of exhibits on heart disease by the Section on Practice of Medicine, a group of exhibits on the treatment of burns by the Section on Surgery, General and Abdominal, and a group of exhibits on air-borne infections by the Section on Pediatrics.

Motion pictures will be shown on regular schedules in six rooms adjoining the exhibits.

Admission to the Scientific Exhibit will be limited to persons wearing Fellowship or other badges of the convention and to guests to whom special cards of admission have been issued. The public will not be admitted to the Scientific Exhibit.

Special Exhibit on Fractures

The special exhibit on fractures is continued again under the auspices of the same committee which has conducted the exhibit for the past several years:

Kellogg Speed, Chicago, chairman.
Frank D. Dickson, Kansas City, Mo.
Walter Estell Lee, Philadelphia.

The following subjects will be considered:

1. Plaster of Paris: Making and Storing.
2. Application of Plaster of Paris.
3. Fracture of the Lower End of the Radius.
4. Fracture of the Spine—Compression.
5. Fracture of the Ankle.
6. Emergency Treatment of Fractures of the Lower Extremities.

Dr. Carl H. Lenhart, Cleveland, is local representative for the fracture exhibit.

The following physicians will take part in the demonstration:

John D. Adams, Boston.	Walter D. Ludlum Jr., New York.
H. O. Anderson, Wichita, Kan.	James W. Martin, Omaha.
C. Glenn Barber, Cleveland.	Arthur R. Metz, Chicago.
S. Potter Bartley, Brooklyn.	John R. Nilsson, Omaha.
W. A. Boyd, Columbia, S. C.	R. J. Noer, Detroit.
Ralph G. Carothers, Cincinnati.	D. H. O'Donoghue, Oklahoma City.
Ralph Merle Carter, Green Bay, Wis.	E. Payne Palmer, Phoenix, Ariz.
Dwight F. Clark, Evanston, Ill.	Garrett Pipkin, Kansas City, Mo.
George J. Curry, Flint, Mich.	Lynn M. Rankin, Upper Darby, Pa.
P. C. Doran, Akron, Ohio.	Rudolph S. Reich, Cleveland.
C. Fred Ferciot, Lincoln, Neb.	Sheppard Remington, Chicago.
Ralph E. Goodall, New York.	Samuel L. Robbins, Cleveland.
G. E. Haggart, Boston.	L. D. Smith, Milwaukee.
Roland Hammond, Providence, R. I.	Alexander M. Steinfeld, Columbus, Ohio.
Vernon L. Hart, Minneapolis.	Russell F. Sullivan, Boston.
Frederick A. Jostes, St. Louis.	Charles F. Thompson, Indianapolis.
Graham A. Kernwein, Chicago.	James R. Tillotson, Lima, Ohio.
Orville C. King, Philadelphia.	James W. Toumey, Boston.
Henry B. Lacey, Columbus, Ohio.	H. W. Virgin Jr., Pensacola, Fla.
Stanley E. Lawton, Chicago.	James M. Winfield, Detroit.
James R. Lincoln, New York.	Harry Winkler, Charlotte, N. C.

Special Exhibit on Lame Backs

The special exhibit on lame backs is presented for the second time under the auspices of an exhibit committee composed of:

Frank R. Ober, Boston, chairman.
Carl E. Badgley, Ann Arbor, Mich.
J. Archer O'Reilly, St. Louis.
Arthur Steindler, Iowa City.
Philip D. Wilson, New York.

An advisory committee is composed of:

Eben J. Carey, Milwaukee.	Philip Lewin, Chicago.
Fremont A. Chandler, Chicago.	Robert D. Schrock, Omaha.
H. Earle Conwell, Birmingham, Ala.	Theodore Willis, Cleveland.
John S. Coulter, Chicago.	E. Harlan Wilson, Columbus, Ohio.
Albert Ferguson, Brookline, Mass.	Walter J. Zeiter, Cleveland.

The exhibit deals with the following factors:

Anatomy.	Roentgenology.
Pathology.	Physical therapy.
Examination of lame backs.	Apparatus.
Neurology.	

A competent corps of demonstrators will be present continuously throughout the week, among whom will be the following:

C. Glenn Barber, Cleveland.	Henry B. Lacey, Columbus, Ohio.
Albert L. Bershon, Toledo.	Raymond E. Lenhard, Baltimore, Md.
A. H. Brewster, Boston.	C. S. Lowendorf, Youngstown, Ohio.
Herbert L. Brumbaugh, Dayton, Ohio.	Wilbert H. McGaw, Cleveland.
F. H. Clark, Cleveland.	Madge C. L. McGuinness, New York.
Clyde W. Dawson, Columbus, Ohio.	Alexander Miller, Cleveland.
Earl C. Elkins, Rochester, Minn.	Louis E. Papurt, Cleveland.
Frank H. Ewerhardt, St. Louis.	Robert L. Patterson, Jr., New York.
C. Fred Ferciot, Lincoln, Neb.	Maurice M. Pike, Hartford, Conn.
Joseph A. Freiberg, Cincinnati.	Frank N. Potts, Buffalo, N. Y.
Kristian G. Hansson, New York.	Fowler B. Roberts, Akron, Ohio.
Maxwell Harbin, Cleveland.	Louis M. Starin, Lakewood, Ohio.
R. Nelson Hatt, Springfield, Mass.	Milton G. Schmitt, Chicago.
Clarence H. Heyman, Cleveland.	James E. M. Thomson, Lincoln, Neb.
W. Richard Hochwalt, Dayton, Ohio.	Theodore H. Vinke, Cincinnati.
Louis G. Howard, Boston.	Edward T. Wentworth, Rochester, N. Y.
M. Beckett Howorth, New York.	Harry Winkler, Charlotte, N. C.
Herman F. Johnson, Omaha, Neb.	Walter Zeit, Milwaukee, Wis.
H. W. Kendall, Dayton, Ohio.	
Samuel Kleinberg, New York.	
Richard Kovacs, New York.	
Charles Kubik, Boston.	

Exhibits on National Defense and War Medicine

Most of the exhibits shown at the Cleveland session have a more or less direct relation to national defense or war medicine. The point is emphasized by grouping the following list:

GORDON B. NEW and JOHN B. ERICH, Mayo Clinic, Rochester, Minn.:

Treatment of Traumatic Injuries of the Face: Exhibit demonstrates by means of models, casts and colored lantern slides the various surgical procedures employed in the treatment of traumatic injuries of the face, including not only the mechanical and surgical methods of reducing and immobilizing all types of fractures of the mandible, maxilla and malar and nasal bones, but also the secondary reconstructive procedures required in the correction of residual bony deformities.

SAMUEL B. HARPER and A. E. OSTERBERG, Mayo Clinic, Rochester, Minn.:

A Simple Method of Preparing Dried Blood Plasma and Its Clinical Use: Exhibit of (1) apparatus used for drying the human plasma; (2) samples of the dried plasma and of the solution of plasma residue as used clinically, and (3) charts representing data obtained from clinical material when solutions of the dried plasma proteins were used.

JOSEPH M. HILL, E. E. MUIRHEAD, C. E. ASHWORTH and LOUIS WATERS, Baylor University Hospital, Dallas, Texas:

Mass Production of Desiccated Plasma and Its Clinical Use in Hypertonic Solution: Exhibit showing actual operation of a plasma center where the plasma is separated, filtered and dehydrated from the frozen state and the desiccated plasma introduced and vacuum sealed in containers.

ROBERT A. BIER and L. G. ROWNTREE, Medical Division, National Headquarters, Selective Service System, Washington, D. C.:

The Medical Function—National Selective Service System: Exhibit of charts, printed forms and tables of figures describing the work of the Medical Division at National Headquarters, Selective Service System, and also the medical function in the various states incident to the examination of registrants.

FRANK W. HARTMAN, Henry Ford Hospital, Detroit:

Separation and Desiccation of Blood Plasma with Cellophane Cylinders: Exhibit showing details of method for collection, separation and desiccation of blood plasma with the use of

The Effect of Anoxia in Altitude Flights to 20,000 Feet on the Electrocardiogram: Exhibit showing (a) representative four

Origin and Early History of the Microscope: Exhibit of originals of several early microscopes, with models of other famous early microscopes; books on microscopes and early microscopists (Malpighi, Hooke, Swammerdam, Green, Leeuwenhoek and others), with explanatory charts and photographs.

Elimination Diets for the Study of Food Allergy: Exhibit showing the value of elimination diets for diet trial in patients suspected of food allergy by selected case histories; the fallibility of the cutaneous test on patients with known sensitizations to foods; charts showing the elimination diets used in the majority of patients, the fruit-free diet for fruit sensitive patients, the low calory elimination diet for obese and diabetic

patients with food allergy, elimination diets to be eaten in restaurants or away from home, and various supplemental elimination diets.

J. WARRICK THOMAS and C. R. K. JOHNSTON, Cleveland Clinic, Cleveland:

Allergy: Cutaneous Manifestation and Rectal Sensitization Studies: Exhibit of wax models of allergic lesions involving the skin and mucous membranes; models of proctoscopic sensitization studies showing the reaction of the mucous membrane following the application of an allergen.

HENRY H. TURNER, REX BOLEND, W. FLOYD KELLER and WAYNE HULL, University of Oklahoma School of Medicine, Oklahoma City:

Clinical Use of Testosterone Propionate: Exhibit of photographs illustrating before and after effects of testosterone propionate in the treatment of hypogonadism, benign prostatic hypertrophy and gynecomastia and the effect of this hormone on skeletal maturation, together with remarks stating types of patients and conditions in which testosterone may be used effectively, and warning against its use in preadolescence, psychic impotence, and the promiscuity of its administration to females.

JOHN D. CURRENCE, A. D. TANNEY and R. W. FINEGAN, New York Post-Graduate Medical School and Hospital:

Physical Therapy in Arthritis: Exhibit of roentgenograms accompanied by clinical photographs, descriptions and photographs and diagrams of the type of physical therapy employed, demonstrating the various physical therapeutic modalities employed in the treatment of arthritis.

WILLARD O. THOMPSON and NORRIS J. HECKEL, Rush Medical College and Presbyterian Hospital, Chicago:

Sex Hormones: Clinical Application: Exhibit illustrating the following with photographs, charts and photomicrographs: (1) the functions of the sex hormones; (2) the indications and contraindications for their use; (3) the effects of their administration on genital growth and other secondary sex characteristics, such as the growth of the breasts, uterus and prostate, particularly in primary hypogonadism; (4) their effects on skeletal growth and on the configuration of the skeleton, and (5) damage to the normal testis and azoospermia from the administration of both the male and female sex hormones.

J. WEST MITCHELL, The Diabetes Commission, Pennsylvania State Medical Society, Sewickley, Pa.:

Work of the Diabetes Commission—Pennsylvania State Medical Society: Exhibit of posters showing problems to be solved in Pennsylvania and results accomplished (two and one-half years' work); examples of hospitals and private office record forms, literature published and primer for diabetic patients; diabetes statistics for Pennsylvania condensed.

LESTER R. DRAGSTEDT, ORMAND C. JULIAN, CORNELIUS W. VERMEULEN, J. GARROTT ALLEN and DWIGHT E. CLARK, University of Chicago, Chicago:

Physiology and Clinical Significance of Lipocaic: Exhibit presenting the role of lipocaic as an internal secretion of the pancreas necessary for life. A deficiency of this hormone causes fatty infiltration in the liver in both experimental animals and man, and this can be prevented or cured by the oral or parenteral administration of pancreas extracts containing lipocaic. The effect of lipocaic in the treatment of psoriasis is presented.

LEANDRO M. TOCANTINS, J. F. O'NEILL and H. W. JONES, Jefferson Medical College of Philadelphia, Philadelphia:

Infusions of Blood and Other Fluids into the Circulation Via the Bone Marrow: Exhibit of charts, models, specimens and drawings demonstrating the rapidity of absorption of substances injected into the marrow of various bones of young and adult men and of rabbits; anatomic landmarks and characteristics of the marrow cavity of various bones; detailed steps of the technic of infusion into marrow; indications, contraindications and limitations of the method.

F. LOWELL DUNN, University of Nebraska, College of Medicine, Omaha, and WALTER J. RAHM JR., New York:

Cathode Ray Visualization of Normal and Pathologic Chest Sounds: Exhibit of cathode ray photographs, descriptive matter describing the chest in question and roentgenograms of the chest; visualization of chest sounds by the use of an amplifier and a cathode ray oscillograph offers definite refinements in analysis over the auditory method.

BERNARD A. WATSON, Battle Creek, Sanitarium, Mich.:

Clinical Significance of Glycosuria and the Prevention of Diabetes: Exhibit showing the result of nine years' study of patients having glycosuria on routine urine examinations and studied further with dextrose tolerance tests; those patients having slightly disturbed curves had repeated dextrose tolerance tests at intervals of about six to eight months; when a diabetic type of curve was found, diet was instituted with recovery of the tolerance in most patients.

JOHN W. NORCROSS, Lahey Clinic, Boston:

Problems in Hematology: Exhibit of diagrams, photographs, charts, posters, drawings and microscopic specimens showing blood cells, blood smears and hematologic problems.

THOMAS M. PEERY, George Washington University School of Medicine, Washington, D. C.:

Incomplete Rupture of the Aorta: A Cause of Cardiac Pain and of Aortic Insufficiency: Exhibit of clinical histories, chest roentgenograms, electrocardiograms and the like showing patients who proved at autopsy to have incomplete tears of the aortic walls; photographs, artist's drawings, diagrams and autopsy specimens illustrating the lesions encountered in the aortic wall; the mechanism of aortic insufficiency in such cases explained by charts and models.

W. H. DEARING, A. R. BARNES, H. E. ESSEX and J. F. HERRICK, Mayo Clinic, Rochester, Minn.:

Effects of Toxic Doses of Digitalis, Pitressin and Prolonged Oxygen Deprivation on Heart, Brain, Electrocardiogram and Coronary Blood Flow in the Experimental Animal: Exhibit of charts, photomicrographs and photographs showing the effects of therapeutic and toxic doses of digitalis on the myocardium, brain, electrocardiogram and coronary blood flow; microscopic sections demonstrating the myocardial and cerebral lesions produced by toxic doses of digitalis, multiple doses of pitressin and prolonged oxygen deprivation.

ALFRED E. COHN, Hospital of the Rockefeller Institute for Medical Research, New York:

Some Aspects of the Natural History of Rheumatic Cardiac Disease: Exhibit of charts illustrating onset of disease; duration of disease; description of course of disease; influence on the course of disease of such factors as activity and auricular fibrillation; nature of death, age and some postmortem observations; mortality in rheumatic cardiac disease.

M. H. BARKER, H. A. LINDBERG, MAURICE WALD and LOYAL DAVIS, Northwestern University Medical School, Chicago:

The Thiocyanates and Hypertension: Clinical and Experimental Observations: Exhibit of charts, photographs, photomicrographs and specimens showing pharmacology; technic of cyanate control and its effect on essential and malignant hypertension and toxic manifestations; experimental hypertension and effect of cyanates, together with clinical observations on the combined surgical and cyanate treatment of hypertension.

LOUIS N. KATZ, RAYMOND S. MEGIBOW, FRANZ S. STEINITZ, MILTON MENDLOWITZ and MAURICE SOKOLOW, Michael Reese Hospital, Chicago:

Observations on Pulmonary Embolism: Exhibit showing pressure changes in the pulmonary and systemic vessels which follow major and multiple minor embolisms, as well as the effect on the circulation time, circulating blood volume, cardiac minute output and arteriovenous oxygen content following major embolism. Roentgenograms in which the pulmonary arterial tree is visualized with 70 per cent diodrast show the effects of pulmonary embolism. The manner in which respi-

ration is affected by major and multiple minor embolism is presented and the changes are correlated with the variations in blood gases. The effects of various therapeutic procedures on these changes are analyzed.

WILLIAM B. WARTMAN, Western Reserve University, Cleveland:

Narrowing or Occlusion of Coronary Arteries: Exhibit of diagrams and photomicrographs illustrating the various lesions which cause narrowing or occlusion of the coronary arteries.

T. J. DRY and F. A. WILLIUS, Mayo Clinic, Rochester, Minn:

Life Expectancy in Various Types of Conduction Disturbances Affecting the QRS Complex: Exhibit showing life expectancy in various types of conduction disturbances affecting the relative frequency and etiology; electrocardiograms illustrating bundle branch block, intraventricular block, wide S wave pattern and conduction disturbances with short PR interval. The term bundle branch block becomes bundle branch block with concordant graphs. The term intraventricular block becomes bundle branch block with discordant graphs. The wide S wave pattern remains unchanged. Conduction disturbances of the shortened PR interval remain unchanged.

ROBERT M. DALEY, RICHARD GUBNER and HARRY E. UNGERLEIDER, Equitable Life Assurance Society, New York:

The Clinical Evaluation of Heart Size Measurements: The detection of enlargement of the heart is a cardinal sign of heart disease and gives valuable information as to the type and extent of the cardiac lesion present. Numerous measurements have been proposed to determine heart size. These are critically considered by means of illustrative roentgenograms, and their practical value and limitations are indicated. Emphasis is placed on the many physiologic variables which must be considered in interpreting the size of the heart. Teleroentgenographic methods are stressed, but comparison is made with orthodiagrams and fluoroscopy. Roentgen methods are compared with the evaluation of heart size by electrocardiography and physical examination.

CHAUNCEY C. MAHER, PAUL H. WOSIKA, WELDON K. BULLOCK and STANLEY GUMBINER, Chicago:

The Cardiovascular Aspects of Sickle Cell Anemia: Exhibit showing that sickle cell anemia is probably an inherited defect occurring in Negroes of whom a percentage have a constant anemia throughout their lives; that those who have anemia persistently develop cardiac enlargement, and congestive heart failure constitutes one mode of death; that few live beyond the thirty-fifth year; that practically all the patients suffer with joint pains and are victims of many intercurrent infections, and that rheumatic heart disease may be suspected of being present. Representative case histories, the sickling phenomenon, the characteristics of the anemia, the mendelian inheritance, the cardiac silhouette, electrocardiograms, water balance charts and autopsy results are shown.

LOUIS I. DUBLIN and DONALD B. ARMSTRONG, Metropolitan Life Insurance Company, New York:

Studies in Acute Rheumatic Fever: Exhibit showing recent data on mortality from rheumatic fever and rheumatic heart disease in children and young adults; annual death rates and causes of death among children after an attack of acute rheumatic fever and factors influencing the mortality; new data on the relative importance of rheumatic heart disease in the total mortality from heart disease.

GERTRUDE P. WOOD, American Heart Association, New York:

Educational Work of the American Heart Association: Exhibit of educational and exhibit material including books, pamphlets and leaflets on various phases of cardiovascular disease.

W. D. CUTTER and HOMER F. SANGER, Council on Medical Education and Hospitals, American Medical Association, Chicago:

Medical Education and Hospitals: Exhibit showing the work of the Council on Medical Education and Hospitals, with

graphic presentation of current surveys of medical colleges, graduate medical education, internship, residencies, licensure and hospital facilities. Charts, maps and descriptive literature based on the Council's original investigations.

Section on Surgery, General and Abdominal

The Section on Surgery, General and Abdominal, in addition to its other exhibits, is presenting groups of exhibits on cancer and on burns. The representative from this section to the Scientific Exhibit is Grover C. Penberthy, Detroit.

GROVER C. PENBERTHY and CHARLES N. WELLER, Children's Hospital of Michigan, Wayne University College of Medicine, Detroit:

The Treatment of Burns: Exhibit of charts, graphs and photographs showing an analysis of 800 to 1,000 cases of burns under treatment since 1922, depicting the various types of treatment and reporting the morbidity and mortality.

ROBERT H. ALDRICH, Boston City Hospital, Boston:

Treatment of Burns with Special Reference to Those Received in War: Exhibit consisting of charts, photographs and drawings showing a complete study on all the burned patients entered in the Boston City Hospital for the last twenty years; comparisons are made on the various forms of treatment, bringing out mortality and morbidity figures, analyzing a series of about 2,000 cases; reprints will be available.

D. M. GLOVER and ARNOLD F. SYDOW, St. Luke's Hospital, Cleveland:

Treatment of Burns: Statistical data which seem to give information concerning the effectiveness of treatment are presented. Management of the acute burn by the coagulation regimen is illustrated, as well as later treatment of the granulating wound and repair of the cutaneous defect.

HENRY N. HARKINS, Henry Ford Hospital, Detroit:

The Treatment of Burn Shock: Exhibit of charts, photographs and specimens demonstrating the nature of burn shock and its relation to death from burns, as well as its relation to other types of shock; the treatment of burn shock is demonstrated; local treatment is cited only with regard to shock prevention; a portion of the exhibit illustrates the treatment of war burns with regard to shock.

EARL C. PADGETT, University of Kansas School of Medicine, Kansas City, Mo.:

Early and Late Care of Soft Tissue Injuries: Exhibit consisting of examples of the early and late care of soft tissue injuries showing before and after results of large lacerated wounds repaired immediately, and also later results after healing has taken place; examples of repair of certain injuries by means of cutaneous grafts are shown, as well as the use of some filling in material such as a thick skin flap, derma or cartilage. Examples of the early care of fractures of the face and jaw bones, showing fractures of the nasal bones, frontal bones, maxillary compound including the malar bone and the mandible. Defects due to injuries in which healing has occurred, including damage to the nasal bones and malar bones from car accidents and other injuries showing large gunshot wounds of the mandible and face.

WILLIAM BATES, BERNARD JUDOVICH, WINIFRED STEWART and JOSEPH HUGHES, Graduate Hospital, University of Pennsylvania, Philadelphia:

Somatic Pain: Exhibit dealing with (1) pain of somatic origin involving shoulder, arm, chest wall, abdominal wall and back; (2) the depressing action of the ammonium ion on "C" fibers, relieving pain without motor effect, including a clinical report of painful syndromes treated by paravertebral nerve block and a series of intraspinal injections using the ammonium ion in cases of intractable pain, (3) skeleton model demonstrating landmarks and step by step technic in regional anesthesia. An electric manikin constructed on a skeleton with electrodes simulating paravertebral roots and sympathetic ganglia which, when properly injected, register on panel board, indicating nerve and distribution. Etiology, diagnosis and treatment of pain and tenderness, segmental in type.

K. J. HENRICHSEN and RICHARD DAVISON, Chicago Municipal Tuberculosis Sanitarium, Chicago:

Diagnosis, Differential Diagnosis and Treatment of Pulmonary Diseases, Tuberculosis: Exhibit of roentgenograms showing case histories, essentials for diagnosis and differential diagnosis in disease of the lungs, treatments and result of treatments.

RICHARD E. HELLER, Northwestern Medical School, Chicago:

Varicose Veins and Their Complications: Exhibit of diagrams, charts, graphs and photographs illustrating the anatomy, physiology, pathology and treatment of the subject; particular emphasis is placed on the relationship of the physiologic changes in varicose veins to the genesis of the complications and to the methods of treatment.

GEZA DE TAKATS, WILLIAM C. BECK, HOWARD HEYER, ROY O. RISER and ROBERT W. KEETON, University of Illinois Medical School, Chicago:

The Surgical Approach to Hypertension: Exhibit of charts illustrating the historic development of surgical treatment, the classification of hypertensive states, the grading of the severity of the disease and the indications for operation. The pre-operative study of patients is described, the various technics used in this clinic are shown, the results are classified and tabulated, the mechanism of relief obtained by surgical methods is analyzed and illustrative case reports are given. Moulages illustrating the degree and nature of arteriolar sclerosis have been prepared and colored photographs of eyegrounds are shown in a transparent box illustrating the various grades of hypertension and the changes occurring after operation.

WOOLFOLK BARROW and FRANCIS M. MASSIE, Lexington, Ky.:

Acute Cholecystitis: Pathology and Results of Treatment in Relation to the Time Elapsing After Onset: Exhibit of various stages in the development of acute cholecystitis, in relation to the time elapsing after the onset of symptoms, shown by photomicrographs and colored films. An analysis of patients with acute cholecystitis is made, with an attempt to correlate the results of treatments with the pathologic changes of the gallbladder. The relationship of operative and conservative treatment to the time elapsing after the onset of symptoms is stressed by charts.

THOMAS A. SHALLOW, KENNETH E. FRY and JOHN DETUERK, Jefferson Medical College Hospital, Philadelphia:

Parathyroid Tumors: Exhibit consisting of a presentation based on the clinical importance of parathyroid adenomas, with observations on a group of patients, including a father and daughter, proved to have true adenomas; charts showing diagnosis, both clinical and laboratory, transparencies showing abnormalities of bones, photomicrographs and photographs of specimens and patients with diagnostic methods and the results obtained from operative treatment.

D. HENRY POER, FRED F. RUDDER, T. STERLING CLAIBORNE and WILLIAM R. MINNICH, Junior League Thyroid Clinic, Grady Hospital, Atlanta, Ga.:

Goiter Experiences in a Southern Clinic: Exhibit showing incidence of goiter in Georgia, comparison of types and varieties seen in the Negro race, pathologic changes, treatment of tetany with dihydrotachysterol and vitamin D, blood iodine studies and relation of ocular tension to serum calcium.

LAWRENCE N. ATLAS, Cleveland City Hospital, Mount Sinai Hospital and Western Reserve School of Medicine, Cleveland:

Lumbar Sympathectomy in the Treatment of Chronic Obliterating Disease of the Peripheral Arteries; An Oscillometric Study: Exhibit consisting of a series of tracings taken with a recording oscillometer; the tracings present evidence of the growth of a pulsating collateral arterial circulation following lumbar sympathectomy in properly chosen cases of chronic obliterating arterial disease of the lower extremities; they also illustrate that, other factors being equal, the degree of col-

lateral circulation formation following lumbar sympathectomy is dependent on the proximal extension of the obliterating process and the pathology of that process.

CLAIRE L. STRAITH and WAYNE B. SLAUGHTER, Detroit, and E. HOYT DEKLEINE, Buffalo:

Plastic Surgery: Exhibit of photographs demonstrating methods used in the immediate care of severe facial injuries such as those encountered in explosions and gun shots. Methods of subsequent repair of facial wounds, injuries and deformities will be demonstrated by color slides projected on a transparent screen in a closed cabinet. Many of these will show actual operative technic and illustrate the results accomplished by the various plastic procedures.

GEORGE CRILE JR., Cleveland Clinic, Cleveland:

Carcinoma of the Thyroid: Exhibit of roentgenograms, photographs, photomicrographs and gross specimens of thyroid carcinoma showing the various types of carcinoma and the treatment recommended.

JAMES BARRETT BROWN, St. Louis:

The Management of Compound Injuries of the Face and Jaws: Exhibit of mounted photographs and roentgenograms describing the subject in general and showing methods of fixation and repair. Follow-up photographs as well as late secondary corrections of some deformities will be included. An effort will be made to emphasize (1) early replacement and fixation if possible before infection and fibrosis has occurred, (2) avoidance of sacrifice of any viable bony or soft tissue in the débridement, (3) the importance of simple direct methods of repair with the use of only a minimum of apparatus and (4) the value of sulfanilamide, especially in wounds involving the floor of the mouth and neck.

W. D. GATCH and J. S. BATTERSBY, Indiana University Medical Center, Indianapolis, Ind.:

Effect of Bowel Distention on Plasma Volume: Exhibit presents experimental studies which explain that overdistention of the bowel as encountered in acute intestinal obstruction will produce a fatal degree of hemoconcentration due to loss of blood plasma. Clinical applications are discussed and an explanation is suggested for sudden death sometimes occurring soon after deflation of obstructed bowel.

ROY D. MCCLURE and CONRAD R. LAM, Henry Ford Hospital, Detroit:

Methods and Results in Heparin Administration: The exhibit consists of posters showing the indications for heparin therapy and the results obtained in 40 patients treated by general heparinization. The chief indications are repeated pulmonary infarctions and arterial surgery. The effect on the clotting time of the various heparin preparations available at this time is demonstrated by charts. Results in arterial surgery utilizing heparin are shown in transparencies, and methods of administration are demonstrated.

HARRY KOSTER, Crown Heights Hospital, Brooklyn:

A Method for Preventing or Diminishing Peritonitis from Leakage After Intestinal Resection or Perforation: Exhibit showing a method for preventing or diminishing peritonitis, based on the principle that it is safe to reposit within the peritoneal cavity bowel which has been exteriorized for several weeks, and on the proposition that peritonitis from leakage cannot occur if the leak (actual or potential) is walled off outside the peritoneal cavity.

R. M. WATKINS, Academy of Medicine of Cleveland, Cleveland:

A Ten Year Survey of the Appendicitis Problem in Cleveland: Exhibit showing a study made on a year by year basis of all cases of acute and suppurative appendicitis which have occurred in metropolitan Cleveland from 1930 to 1940, including about 15,000 case reports. The usual routine analyses of the diagnostic procedures and the surgical care are made with special emphasis on studies of the relationship between delay in operation and mortality rate, of the economic status of the

patients, of the influence of taking laxatives, of the comparative results on charity cases and private patients and of the influence of age on results.

WILLIAM Y. LEE, Philadelphia:

Gallbladder Visualization by Direct Injection of Dye Through Peritoneoscope: Exhibit showing a series of roentgenograms comparing gallbladder visualization by the ordinary oral method of dye administration, and a new method of direct injection of dye into the gallbladder through the peritoneoscope. The ordinary peritoneoscope has been modified, offering great possibilities in cholecystography and in the further study of the etiologic factors in cholelithic disease.

ARNOLD S. JACKSON, JAMES A. JACKSON and J. NEWTON SISK, Jackson Clinic, Madison, Wis.

Cancer of the Gastrointestinal Tract: Exhibit of moulages, transilluminated drawings, charts and roentgenograms showing cancer of the esophagus, stomach, small and large intestine and rectum. Statistical charts emphasize the characteristic symptoms and results of operative treatment. The technics of various surgical procedures, such as the use of the De Petz suture machine for gastric resection, the Devine operation for resection of the large bowel and the new operation for cancer of the rectosigmoid, are illustrated by moulages. A case of total gastrectomy including the preoperative and postoperative roentgenograms, the gross specimen and the follow-up is shown. Motion picture films illustrating types of operations are shown in the motion picture hall.

GEORGE T. PACK, GORDON McNEER and EDWARD M. LIVINGSTON, Memorial Hospital for Cancer and Allied Diseases, New York:

Cancer of the Stomach: Exhibit showing studies on etiology, clinical, gastroscopic, roentgen-ray diagnosis, prognosis and end results. The end results include not only the figures from the Memorial Hospital but the world figures (every statistical article from 1870 to 1940). Technical details of all operative procedures are shown, including total gastrectomy and trans-thoracic resection of the cardiac end of the stomach, metabolic studies after total gastrectomy, detailed chemical studies of the relation of atrophic gastritis to cancer and radiation therapy of gastric cancer.

G. V. BRINDLEY, Scott and White Hospital, Temple, Texas:

Carcinoma of the Colon; Factors Affecting Its Cure: The exhibit will consist of moulages and drawings showing various methods of surgical technic in the treatment of carcinoma of the colon. It includes also moulages of pathologic specimens, photomicrographs and statistics. The time at which the diagnosis is made, the extent of the neoplasm, the location of the lesion, the size of the growth, the degree of cell activity and the type of surgical treatment instituted are all factors affecting the cure of carcinoma of the colon.

WALTMAN WALTERS, HOWARD K. GRAY and JAMES T. PRIESTLEY, Mayo Clinic, Rochester, Minn.:

Malignant Lesions of the Stomach; Importance of Early Treatment and End Results: Exhibit consisting of a statistical analysis of 11,000 cases in which a diagnosis of malignant lesions of the stomach was made in 1907 to 1938 inclusive; operation in 6,352 cases, in 2,840 of which gastrectomy was performed. Detailed analysis shows graphically (1) five year, ten year, fifteen year, twenty year and twenty five year survival rates; (2) five year survival rate according to grade of malignancy and according to the age of the patient; (3) five year survival rate according to involvement of the lymph nodes and according to extension, and (4) five year survival rate according to type of lesion. Diagrammatic models describe various types of gastrectomy and palliative procedures; moulages and transparencies show the gross and microscopic pathologic changes of various grades and types of malignant lesions of the stomach with their corresponding roentgenograms; the extreme importance of early recognition of "ulcer" type of precancerous lesions and value of gastroscopy are emphasized.

ALFRED GOLDMAN, University of California Medical School, Thoracic Surgery Clinic, San Francisco:

Benign and Malignant Tumors of the Lung: Exhibit of transparencies depicting the clinical course, history, roentgen studies, gross pathologic changes, histology, diagnosis and treatment of tumors of the lung; cases of bronchial adenoma are illustrated together with data describing their life history and differentiation from other polypoid bronchial tumors; carcinoma of long and of short duration as well as some rare tumors are illustrated.

Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is H. Close Hesselstine, Chicago.

F. H. FALLS and CHARLOTTE S. HOLT, State Department of Public Health and University of Illinois College of Medicine, Chicago:

Cesarean Section: Exhibit of fifteen sculptured models depicting the pathologic anatomy and operative technic involved in the common operations for cesarean section. Special steps in technic and indications for operations are shown in wash drawings. A lettered chart pointing out more common indications and contraindications for the operation, and one indicating important historical facts in regard to development of the operation are shown; also a lettered chart on the use of the roentgen ray in determining indications.

CON FENNING, University of Utah, Salt Lake City; F. L. ADAIR and M. E. DAVIS, University of Chicago, Chicago:

Analysis of Recorded Uterine Motility During Pregnancy and Labor: Exhibit of recordings, charts, posters and drawings illustrating standards for analysis involving normal and abnormal contractural displacements, normal and abnormal sequential contractural displacements, statistical analysis of the recordings showing frequency distribution of grouped data, standard deviations and significance ratios existing between classes and subclasses of cases investigated; illustrations showing the practical application of the results in the assay of medicinal agents acting to modify uterine activity. Demonstration of the improved electrical and mechanical equipment suitable for recording uterine motility during pregnancy and labor.

PAUL F. FLETCHER, ORA J. GIBSON and S. EDWARD SULKIN, Venereal Disease Control Service and Laboratory Section of the St. Louis Health Division, St. Louis:

Diagnosis and Treatment of Gonorrhea in Women: Exhibit presenting a study of the clinical and laboratory diagnosis of gonococcal infections in women, and the treatment of same with a sulfathiazole-beta lactose combination, and sulfathiazole alone in 165 cases; an evaluation of the dependability of the microscopic (smear) and cultural methods of laboratory diagnosis; an account of the methods of treatment and a critical analysis of the results obtained that is based on a follow-up study of individual cases by routine smears and cultures, taken at weekly intervals for at least three months after cessation of treatment.

HOWARD L. ALT, Q. B. DEMARSH and W. F. WINDLE, Northwestern University Medical School, Chicago:

Immediate and Delayed Clamping of the Umbilical Cord; Effects on the Infant: Exhibit consisting of a model, illustrations, graphs, written statements and the like depicting (1) the history of the time of clamping the umbilical cord; (2) the amount of blood that can be obtained from the placenta after immediate and delayed clamping of the cord; (3) the relationship between the blood volume in the placenta and infant and the flow of placental blood into the infant; (4) the significance of the blood lost to the infant by early clamping of the cord; (5) the blood picture of the infant after immediate and delayed clamping of the cord and (6) the possible role of deprivation of the infant of its placental blood in the cause of iron deficiency anemia during the first year of life.

I. C. RUBIN, Mount Sinai Hospital, New York:

Diagnosis of Impaired Tubal Function by Kymographic Uterotubal Insufflation and Soluble Viscous Contrast Medium: Exhibit showing a manikin (artificial mechanism) demonstrating uterotubal insufflation with insufflation apparatus attached; transparencies showing comparative value of kymographic uterotubal insufflation and the use of a soluble viscous radiopaque medium in which the former are to be supplemented by roentgen ray contrast mediums versus the use of iodized oils, emphasizing the disadvantages of the latter.

W. W. GREULICH, The Brush Foundation, Western Reserve University School of Medicine, Cleveland, and HERBERT THOMS, Yale University School of Medicine, New Haven, Conn.:

Growth and Development of the Female Pelvis During Puberty and Early Adolescence: Exhibit showing anterior, posterior and lateral roentgenograms, repeated at intervals over a period of several years on 107 puberal girls with illustrations of the development of the various pelvic types.

ROBERT L. DICKINSON, New York:

Premarital Consultation: Exhibit of posters outlining topics covered in usual consultations; examinations required by law in different states; other parts of examination, based on general and special needs as developed by the history of the couple, such as hereditary disorders, especially if occurring in both families, infections, possibility of sterility from such; important inhibitions. Pictures and models are shown which have been found useful in answering specific inquiries of the engaged couple concerning anatomy and physiology, antepartum care, birth and aftercare.

LEO WILSON and RAPHAEL KURZROK, College of Physicians and Surgeons, Columbia University, New York:

Contractions of the Human Uterus; Hormonal Control in Gravid and Nongravid Women: Exhibit consists of recordings of uterine contractions during the normal menstrual cycle, pregnancy, labor and the early puerperium, and in cases of functional dysmenorrhea, oligomenorrhea, amenorrhea and failure of ovulation. The action of the female and male sex hormones on uterine contractility is demonstrated. The relation of the menstrual myometrial cycle to the contractions of pregnancy and labor is discussed.

CLARENCE J. GAMBLE, Milton, Mass., and R. L. BROWN, St. Louis:

A Method for Determination of the Relative Spermicidal Solutions and Jellies: Exhibit demonstrating determination of spermicidal time, showing spermicidal activity with dark field microscope; apparatus for the accurate measurement of 0.04 cc. of semen which permits multiple comparisons with a single specimen; charts and posters of experiments showing variations in spermicidal time with age of specimen, indicating the necessity of comparing spermicidal materials with semen from the same specimen mixed with each at the same time; charts of comparisons of spermicidal times found for certain commercial spermicides.

MORTIMER N. HYAMS and WILLIAM B. SILBERBLATT, New York Post-Graduate Hospital and Beth David Hospital, New York:

Chronic Endocervicitis—A Clinical Pathologic Study: Exhibit showing an intensive study of the varied stages of endocervicitis in its relation to treatment, illustrated with transilluminations, photomicrographs and specimens.

CHARLES EDWIN GALLOWAY and T. D. PAUL, Northwestern University and Evanston Hospital, Evanston, Ill.:

Cervical Pathology: Exhibit of photographs, photomicrographs and enlarged colored plates of cervical lesions of all kinds; model and camera used; projection of photographs.

Section on Ophthalmology

The section exhibit committee of the Section on Ophthalmology consists of Georgiana Dvorak Theobald, Oak Park, Ill., chairman; Derrick Vail, Cincinnati, and John E. L. Keyes, Youngstown, Ohio.

ALBERT D. RUEDEMANN, Cleveland Clinic, Cleveland:

Exophthalmos: Exhibit showing the various types of exophthalmos, both unilateral and bilateral. Methods of diagnosis are portrayed by wax models and colored photographs. Surgical procedures for the various types are indicated by charts.

PHILLIPS THYGESON and W. L. STONE JR., Institute of Ophthalmology, New York:

Epidemiology of Inclusion Conjunctivitis: The experimental work on inclusion conjunctivitis in the adult and newborn is summarized; the properties and methods of demonstration of the virus are detailed and the occurrence and characteristics of infections of the genitourinary tract from which the virus can be isolated are described; evidence is advanced indicating that eye to eye transmission is rare and that most infections arise by transfer from the genitourinary tract; the parallelism with the epidemiology of gonorrheal ophthalmia is stressed.

HENRY MINSKY, Harlem Hospital, New York:

Repair of Recent Lid Lacerations (Intramarginal Splinting Suture): Exhibit showing that the repair of recent lid lacerations involving the margin is achieved by a simple procedure which splints the margin of the torn lid against the other intact one. A suture through the tips of the wound in the plane of the gray line of both lids prevents vertical overriding even when the eyeball is perforated or absent. When both margins are lacerated at a common point, a "figure-of-eight" intramarginal splinting suture is employed to insure perfect approximation. In avulsion of the lid, overcorrection (higher and more posterior) is assured by a deep mattress suture anchored to the periosteum above the dome of the sac. The torn caniculus is threaded to attempt preservation of its lumen.

RICHARD THOMPSON and D. L. KHORAZO, Institute of Ophthalmology of Presbyterian Hospital, New York:

Role of the Bacteriologic Laboratory in Ophthalmology: Exhibit summarizing in detail the functions of the bacteriologic laboratory in the diagnosis and treatment of ocular disease, in the teaching of residents and special students and in research.

ISADORE GIVNER and LOUISE H. MEEKER, New York Post-Graduate Medical School and Hospital, New York:

Ocular Infections: Exhibit of transparencies depicting clinical, histologic and in some cases bacteriologic pictures of infections of the eye, including in its scope virus infections, bacterial synergism in lid necrosis, fungous infections as well as bacterial infections.

LORAND V. JOHNSON and ROBERT E. ECKARDT, University Hospitals, Cleveland:

Rosacea Keratitis and Other Conditions with Vascularization of the Cornea Treated with Riboflavin: Exhibit of diagrams, photographs and illustrative material showing the type of lesion which responds best to riboflavin therapy.

WILLIAM EVANS BRUNER, LEONARD GREENBURG, HEDWIG S. KUHN, ISOBEL JANOWICH, ELEANOR BROWN MERRILL and HELEN BENNETT SMITH, National Society for the Prevention of Blindness, Inc., New York:

The Eyes in National Defense: Exhibit of pictures and charts indicating the need of conservation of vision in national defense, emphasizing especially (1) the fact that defective vision is one of the most frequent causes of rejection in the draft, (2) the relation of eyesight to industrial efficiency and (3) the part the medical man plays in eliminating visual handicaps as a bottle-neck in industrial efficiency.

Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is Fred W. Dixon, Cleveland.

C. W. ENGLER, S. C. MISSAL and H. S. REICHLE, Cleveland City Hospital, Cleveland.

Normal and Pathologic Larynges: Exhibit of human larynges impregnated with wax. Accompanying each patho-

logic specimen is a résumé of the clinical history together with a description of the gross and microscopic findings. Larynges are exhibited showing difference in appearance at various ages; also pathologic larynges. A small section is devoted to the larynges of animals to show the comparative anatomy.

H. G. KOBRAK, J. R. LINDSAY and H. B. PERLMAN, University of Chicago, Chicago:

The Conduction of Sound in the Ear: Exhibit consisting of a series of human temporal bones, prepared in such a way as to demonstrate the following physiologic phenomena: (1) the movement of the ear drum; (2) the movement of the ossicular chain and the alterations of the movements which occur in variation of frequency and intensity; (3) the influence of contraction of the intrinsic muscles of the ear on the vibration of the ossicular chain, and (4) methods of testing the physiologic characteristics of the sound conduction mechanism (resonance frequency, dampening coefficient, position of axis).

CHEVALIER L. JACKSON and JOHN FRANKLIN HUBER, Temple University School of Medicine, Philadelphia:

Applied Anatomy of the Tracheobronchial Tree: Exhibit of specimens, models, diagrams and photographs illustrating the lobar divisions of the right and left lungs respectively, and particularly demonstrating their subdivision into bronchopulmonary segments; the clinical importance of the recognition of the lobar bronchi and their segmental branches in relation to the corresponding lobes and segments of lobes is shown by the specimens and models, as well as by correlated bronchoscopic views and roentgenograms.

GEORGE E. SHAMBAUGH JR., Rush Medical College, University of Chicago, Chicago:

Fenestration Operation for the Improvement of Hearing in Otosclerosis: Exhibit showing that surgical reconstruction of the auditory conducting mechanism by means of the fenestration operation is the only treatment for otosclerosis which has yielded audiometrically substantiated improvements in hearing greater than could be attributed to normal variations. The indications for the fenestration operation are presented; the technic at present being used is illustrated by means of specimens, and the results secured in a three-year experience with this operation are shown.

G. ALLEN ROBINSON, Manhattan Eye, Ear, Throat Hospital and New York Eye and Ear Infirmary, New York:

Tumors of the Ear: Exhibit presenting a classification of benign and malignant tumors of the external and middle ear, the clinical features of malignant neoplasms, the methods of treatment by radiation and surgery and the end results of treatment.

Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is Arthur F. Abt, Chicago. In addition to other exhibits, the section is presenting a group of exhibits on the control of air-borne infections.

WILLIAM FIRTH WELLS and MILDRED WEEKS WELLS, University of Pennsylvania School of Medicine, Philadelphia:

Air-Borne Infection, Prevention and Control: Exhibit demonstrates the prevention and control of air-borne infection by bactericidal irradiation of air; the prevention of air-borne hospital cross infections by ultraviolet light barriers; the control of epidemic childhood contagion by raising the "threshold density" above the "susceptible density," accomplished through radiant disinfection of air, and the method of measurement of sanitary ventilation by radiant disinfection. The exhibit presents clinico-epidemiologic experience with full scale installations in hospitals, institutions, dormitories and schools and offers a code based on the correlation of the measurements of sanitary ventilation with the measurements of the spread of infection and contagion.

PAUL GYÖRGY, Babies and Childrens Hospital, Cleveland:

Intoxication versus Deficiency in Experimental Dietary Conditions: Exhibit of posters, photomicrographs and specimens illustrating intoxication versus deficiency in experimental dietary

conditions, with such examples as cirrhosis of the liver, cancer of the liver, cortical necrosis of the kidneys, and egg-white injury.

NORMAN C. WETZEL, Babies and Childrens Hospital, Cleveland:

Physical Fitness from Infancy to Maturity: Exhibit of charts, posters and photographs dealing with physical fitness from infancy to maturity in terms of physique (body build), developmental level, nutritional grade, physical status, age advancement and basal metabolism; an objective method of evaluation affording a guide to individual physical progress.

L. W. SAUER, LOUIS D. MINSK and IWAN ROSENSTERN, The Cradle, Evanston, Ill.:

Prevention of Cross Infection in Nurseries: Exhibit demonstrating equipment and features applied at The Cradle to prevent hand-borne cross infections; the practical application of air conditioning, germicidal lights and mechanical barriers to prevent air-borne cross infections; bacteriologic and preliminary clinical results.

HENRY J. GERSTENBERGER, Babies and Childrens Hospital, Cleveland:

Vitamin D Studies: Exhibit showing (a) the relative efficacy of vitamins D₂ and D₃ in the cure of rickets in monkeys (*Macacus rhesus*); (b) the relative effectiveness of vitamin D₂ dissolved in oil and in propylene glycol in the cure of rickets in monkeys (*Macacus rhesus*), and (c) the effectiveness of parenteral—single, small dose—administration of vitamin D₂ in the prevention and cure of infantile rickets.

KARL A. MEYER, HANS POPPER and ALEX B. RAGINS, Cook County Graduate School of Medicine and Cook County Hospital, Chicago:

Histologic Demonstration of Vitamin A in Tissues: Exhibit showing that vitamin A imparts a characteristic fluorescence which is used in the histologic demonstration of vitamin A in tissues by means of fluorescence microscopy. Photomicrographs will be shown demonstrating the distribution of vitamin A in human organs under normal and pathologic conditions and also in the organs of experimental animals under various nutritional conditions. The vitamin A fluorescence will be demonstrated in frozen sections of human organs under the fluorescence microscope.

JAMES A. REYNIERS, Laboratories of Bacteriology, University of Notre Dame, Notre Dame, Ind.:

Air-Borne Infection—Prevention and Control: Exhibit showing the control of air-borne infection by filtration of the air.

J. VICTOR GREENEBAUM, THEODORE K. SELKIRK and SAMUEL BROWN, Jewish Hospital, Cincinnati:

Roentgen Kymography of the Heart in Childhood: Exhibit of roentgenkymograms showing examples of acquired and congenital cardiac diseases in childhood; demonstrations on roentgen films of permanent recording of cardiac silhouette movements fleetingly observed by fluoroscopic examination.

Section on Pharmacology and Therapeutics

The representative to the Scientific Exhibit from the Section on Pharmacology and Therapeutics is O. P. J. Falk, St. Louis.

K. K. CHEN and G. H. A. CLOWES, The Lilly Research Laboratories, Indianapolis:

Variations of Drug Action: Exhibit showing the racial difference of response to drugs and chemicals, examples of which are mustard gas and mydriatics to Caucasians, Orientals and Negroes; also the species difference of response to drugs, such as digitalis-like drugs in different experimental animals; result on sex difference and temperature difference are shown.

EDWIN E. OSGOOD, University of Oregon Medical School, Portland, Ore.:

Neosarsphenamine in the Therapy of Bacterial Infections: Exhibit of tables, graphs and photomicrographs demonstrating

the effectiveness of neosarsphenamine against infections with staphylococci, *Streptococcus viridans* and other organisms in the presence of living human cells. Data on the levels necessary for bactericidal action; the excretion, toxicity and comparative effectiveness with other arsenicals and drugs of the sulfanilamide group and on the mechanism of action are presented; the correct dosage for clinical therapy; the evidence that uniform blood levels are maintained by this dosage schedule; and temperature charts and case histories of patients treated with this method.

FRANKLIN F. SNYDER, Chicago Lying-in Hospital, University of Chicago, Chicago:

Obstetric Analgesia: Exhibit showing (1) a new method of assay especially sensitive for determination of effects on the fetus as indicated by changes in fetal respiration and circulation; (2) results of assay of the analgesic and depressant effects of the drugs commonly administered during labor, e. g. morphine, scopolamine and barbiturates; (3) the risk involved in treatment of respiratory depression by the administration of respiratory stimulant drugs, e. g. alpha-lobeline, caffeine, nikethamide, metrazol and cyanide.

HENRY R. KREIDER, Chemical Laboratory, American Medical Association, Chicago:

The Laboratory of the American Medical Association as an Aid to the Physician: Exhibit of charts and materials designed to acquaint the physician with the work of the laboratory, its method of procedure and its relation to the medical profession.

E. PERRY McCULLAGH, E. J. RYAN and D. ROY McCULLAGH, Cleveland Clinic, Cleveland:

Male Sex Hormones—Some Physiologic and Clinical Observations: Exhibit showing the therapeutic effects and metabolic alterations resulting from the use of male sex hormones (testosterone propionate and methyl testosterone), illustrated graphically through the medium of charts, photographs and descriptions. In eunuchism, the changes in bodily configuration, hair growth, genital development, epiphyseal age, prostate and the like as a result of testosterone propionate therapy are demonstrated. The use of this preparation in castrates, in the male climacteric and in women is brought out. Sodium chloride and nitrogen retention and gain in body weight as a result of testosterone propionate are demonstrated, as well as the effects on basal metabolic rate. The effect on spermatogenesis, the volume of semen and sperm motility is emphasized. The therapeutic effects of methyl testosterone are discussed briefly and the metabolic changes listed are demonstrated. Certain of the endocrine interrelationships involved and the urinary distribution of androgens are brought out.

ELMER H. LOUGHLIN, SAMUEL H. SPITZ and RICHARD H. BENNETT, Long Island College of Medicine, Brooklyn:

Pneumococcal Lobar Pneumonia: Exhibit of charts, posters, photographs, transparencies and moulages presenting the etiologic diagnosis, the clinical diagnosis, treatment both general and specific, complications and technical methods, including bacteriology and methods of administering serum and drugs.

Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Frank W. Konzelmann, Philadelphia.

HAROLD F. BLUM, HUGH G. GRADY and JOHN S. KIRBY-SMITH, National Cancer Institute, Bethesda, Md.:

Induction of Cutaneous Cancer by Ultraviolet Radiation: Exhibit describing the production of tumors of the skin of mice by ultraviolet radiation, and the changes antedating tumor formation; photographs and transparencies illustrating the gross and microscopic pathologic changes, and experimental methods; charts illustrating various physical factors involved such as wavelengths, dosage and penetration. Relationship to cutaneous cancer in man is considered.

DANIEL J. GLOMSET and ANNA T. A. GLOMSET, Iowa Methodist Hospital, Des Moines, Iowa:

The Morphology of the Cardiac Conduction System: Exhibit of specimens showing structure of the heart in the region of sulcus terminalis and of the region of the bundle of His in man, dog, sheep, cattle, horse and swine; slides showing histology of the two regions in the heart mentioned and miscellaneous photographs; posters showing development of conduction knowledge; summary of observations.

R. K. STRAUS, S. R. GERBER, M. E. COWAN and A. J. KAZLAUCKAS, Cuyahoga County Morgue, Cleveland:

Chemical Determination of Alcoholic Intoxication: Certain Medicolegal Aspects: Exhibit showing the modified Nicloux procedure for the chemical determination of alcohol in the body fluids; charts evaluating the chemical changes in relation to alcoholic intoxication, the pathologic physiology of acute alcoholism and the role of alcoholism in vehicular fatalities, homicides, suicides and sudden deaths.

HUGH JETER and CURTIS H. EPPS, University of Oklahoma, School of Medicine and University Hospitals, Oklahoma City:

Diagnostic Value of Paracentetic and Other Aspiration Fluid Examinations: Exhibit of photomicrographs illustrating material from proved cases in which reports as to the malignant condition have been made and the final diagnosis proved by surgery or autopsy. Most of the material will represent examinations of paracentetic fluid while a few interesting aspiration biopsies are included. Brief legends accompany each group of pictures, giving the essential data on each of the cases reported. Charts give a summary of observations.

JOHN FALLON, JAMES T. BROSNAN and WILLIAM G. MORAN, Fallon Clinic, Worcester, Mass.:

The Candid Camera Applied to Medicine: Exhibit showing how the miniature precision camera, with certain adjuncts, brings simple color photography within reach of the physician himself; that is, the average physician who, although he lacks both the time to putter and the help of a photographic department, nevertheless sees many picture-worthy lesions. The exhibit demonstrates the integration of standard camera accessories with each other and with homemade apparatuses for photography in the office, in the ward, in the operating room and in the laboratory. Although three out of four clinical pictures can be hand-held snapshots through a simple close-up attachment, the exhibit also illustrates some of the more elaborate setups, as for microscopic, macroscopic and endoscopic photography; a simple photographic truck; an operating room crane, and the use of polarized light.

WARD J. MACNEAL and FRANCES C. FRISBEE, New York Post-Graduate Medical School and Hospital, New York:

Bacteriophage as an Aid in the Treatment of Staphylococcal Infections: Exhibit illustrating the character and behavior of bacteriophages in laboratory experiments as well as the method of therapeutic application with selected case records showing results.

ANNE SHIRAS, Biological Photographic Association, Pittsburgh:

Medical Photography: Exhibit showing examples of the best work in the various types of medical photography with the idea of raising the standards of illustrations in medical books and journals. Gross specimens, photomicrography, clinical records, color prints, color transparencies and apparatus are shown, with examples of faulty and inadequate photography included for comparison.

FRANK W. KONZELMANN, American Society of Clinical Pathologists, Philadelphia:

The Pathologist: Contribution to Advance of Medicine: Exhibit showing the many ways in which the pathologist contributes to the advancing standard of medicine in the community. This exhibit is shown in the hope that the medical profession may better understand the work of the pathologist and the part he plays in medical advancement.

CLARA RAVEN, Woman's Medical College of Pennsylvania, Philadelphia, and Youngstown Hospital Association, Youngstown, Ohio:

Leptospirosis: Laboratory and Clinical Aspects: Exhibit showing dark field demonstrations of *Leptospira icterohaemorrhagiae* and *Leptospira canicola* together with the culture medium used. Lantern slides showing *Leptospira* in tissues and the gross pathologic changes as shown in the guinea pig, showing the difference for the two strains. Charts showing laboratory methods for diagnosis in man and animals; incidence of canine leptospirosis in various countries including a study in Pennsylvania; incidence of Weil's disease in man; animals which serve as reservoirs of leptospira and the method of spread to man.

R. O. MUETHER, St. Louis University Medical School, St. Louis:

Studies on Lyophile Bovine Serum and Plasma as a Blood Substitute: Exhibit based on immunologic, chemical and clinical studies done on patients given bovine serum and plasma in amounts varying from 250 cc. to 2,000 cc; studies on anaphylaxis and sensitivity as well as studies on total protein, albumin, globulin ratio, and the like.

BÉLA HALPERT, Louisiana State University School of Medicine, New Orleans:

Carcinoma of the Lung: Morphologic Aspects: Exhibit showing a graphic presentation of the cellular structure of carcinoma of the lung; based on the assumption that they are all derived from a common ancestor cell, carcinomas of the lung are divided into squamous cell, columnar cell and reserve cell carcinomas; the microscopic and gross appearances are shown, with photomicrographs and gross specimens; an analysis is given of carcinomas of the lung observed in the necropsy material of the Charity Hospital of Louisiana at New Orleans for the years 1931-1940 inclusive, and statistics are presented as to their relative frequency and race and sex incidence.

M. LAURENCE MONTGOMERY, University of California Medical School, San Francisco:

Control of Liver Lipids by Pancreatic Juice: Exhibit showing that the slow development of fatty livers in depancreatized dogs maintained with insulin is related to the exclusion of pancreatic juice from the intestine, since it occurs following duct ligation and is prevented as effectively by administration of pancreatic juice as by feeding of raw pancreas and choline, and showing that this process differs from the rapid infiltration of fat in the liver due to insulin deficiency, since it occurs in spite of adequate insulin replacement therapy. Data compare depancreatized and duct-ligated controls with juice-fed animals; include photographs, transilluminated color lantern slides, photomicrographs of liver histology and gross specimens of livers, mounted in Kaiserling solution in watch-glass forms.

HENRY FIELD SMYTH and HERMAN A. SHELANSKI, University of Pennsylvania, Philadelphia:

Argyria Produced Experimentally in Laboratory Animals: Exhibit showing applications of several silver salts made directly into the stomach, vagina, bladder and eye of rabbits, while stomach and eye applications were made on white rats. The substances used were silver nitrate, mild silver protein and silver picrate. A histologic study was made on various tissues impregnated with silver nitrate, mild silver protein, strong silver protein and silver picrate. Some of these tissues were exposed to ultraviolet rays and compared with others stained with hematoxylin and eosin.

S. A. GOLDBERG and PHYLLIS STANLEY, Presbyterian Hospital, Newark, N. J.:

The Pathology of Arthritis: Exhibit of transparencies of gross and microscopic sections demonstrating the pathologic changes which occur in the synovial membrane, articular cartilage and subchondral bone, with the very early formation of synovial pannus and early erosions of the articular cartilage. The material is taken from cases of chronic arthritis in man supplemented by cases of arthritic joints in animals.

Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is F. P. Moersch, Rochester, Minn.

G. WILSE ROBINSON, G. WILSE ROBINSON JR. and PRIOR SHELTON, Neurological Hospital, Kansas City, Mo.:

The Psychoses of Old Age: Exhibit showing that the majority of the abnormal mental states which develop after the age of 60 can be corrected; graphic and statistical analysis of 90 consecutive admissions of patients over 60 suffering from a mental disorder, less than half of whom were diagnosed as having senile dementia or arteriosclerotic psychosis; of the patients who were treated intensively, 79 per cent recovered enough to return home and to resume part or all of their former activities; etiology, pathology, prevention and treatment of the various syndromes are outlined.

SIDNEY W. GROSS, Mount Sinai Hospital, New York:

Cerebral Arteriography: Exhibit of charts and illustrations describing the indications and technic of cerebral arteriography with diodrast; roentgenograms demonstrating the normal human cerebral arteriogram and the alterations found in cerebral aneurysms, angiomas, neoplasms and arteriosclerosis.

HENRIETTA PRICE, Sheppard and Enoch Pratt Hospital, Towson, Md.:

Occupational Therapy Activities at a Psychiatric Hospital: Exhibit of posters illustrating the mental, manual and physical activities in occupational therapy department at the Sheppard and Enoch Pratt Hospital.

WALTER L. BRUETSCH, Central State Hospital, Indianapolis:

Rheumatic Epilepsy (Sequel of Rheumatic Fever): Exhibit showing that the term rheumatic epilepsy is used in cases in which convulsions develop following rheumatic fever or chorea and in cases in which chronic rheumatic cardiovalvular disease is present; the essential lesion in the brain in these cases consists of a recurrent vascular process (rheumatic arteritis) with subsequent areas of gross and microscopic infarctions; photographs of changes of the brain and clinical records of cases in which there is rheumatic epilepsy are presented.

WALTER FREEMAN and JAMES W. WATTS, George Washington University, Washington, D. C.:

Surgical Treatment of Mental Disorders: Exhibit of charts, diagrams and roentgenograms illustrating five years' experience with the operation of prefrontal lobotomy; tables showing the present condition of 80 patients operated on, the complications encountered, the indications and contraindications for operation and the theories underlying the procedure.

PAUL F. A. HOEFER and TRACY J. PUTNAM, Neurological Institute, New York:

Modern Electrodiagnosis, the Use of Electroencephalography and Other Electrical Tests as Routine Procedure: Exhibit presenting an analysis of the results of electroencephalography carried out in 1,500 cases. Focal lesions such as tumor, abscess, head injury or generalized abnormalities such as the different types of epilepsy were studied. Action potential studies of muscles have afforded some information concerning the mechanism of innervation in spasticity, rigidity, parkinsonian tremor, athetosis, dystonia and chorea. Routine electrical stimulation is of decisive significance in a few conditions, such as malingering. In most others they can usually be replaced by clinical and action potential studies.

LILLIAN COTTRELL, University of Minnesota, Minneapolis:

Histologic Variation in Nerve Trunks with Age and Chronic Debilitating Disease: Exhibit of photomicrographs with explanatory drawings depicting changes with age; for comparison, nerves are shown from patients with debilitating disease. These changes include (a) endothelial proliferation, medial fibrosis and hyalinization of blood vessels, (b) increase in endoneurium with invasion and replacement of nerve bundles and (c) alterations and reduction of parenchyma.

Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Hamilton Montgomery, Rochester, Minn.

PAUL E. BECHET, New York Post-Graduate Medical School and Hospital, New York:

Early American Dermatologists: Exhibit of autographed letters, signed manuscripts, original monographs, portraits, photographs, first editions and the like of early American dermatologists, with a brief biographic sketch of each one; mimeographed copies of a brief historical review of American dermatology distributed to visitors on request.

MAXIMILIAN E. OBERMAYER, University of Chicago, Chicago:
Cutaneous Diseases Due to Animal Organisms (Excluding Protozoa): Exhibit of charts, photographs and mounted specimens of organisms and photographs of clinical manifestations of such dermatoses as trombidiosis, acarodermatitis urticaroides (grain itch), Rocky Mountain spotted fever, pediculosis, creeping eruption, schistosomiasis, uncinarial dermatitis (ground itch) and loa loa and of the cutaneous changes produced by *Demodex folliculorum*, spiders, wood ticks, various insects—such as *Cimex lectularius*, fleas, flies and moths, and leeches and other vermes. A table gives a schematic classification of all important animal organisms with the diseases they cause.

DUNCAN O. POTH and S. R. KALISKI, San Antonio, Texas:
Hormone Therapy in Tinea Capitis: Exhibit presenting the results of hormone therapy in tinea capitis with charts showing the response to both theelin and stilbestrol, together with the number of patients, dosages used and healing time.

HAROLD THOMAS HYMAN, WILLIAM LEIFER and LOUIS CHARGIN, Mount Sinai Hospital, New York:

Massive Dose Chemotherapy of Early Syphilis by the Intravenous Drip Method: Exhibit of charts and posters illustrating "speed shock," intravenous drip, toxicology and clinical results in the treatment of patients with early syphilis.

REUBEN FRIEDMAN, Temple University School of Medicine, Philadelphia:

Scabies: Exhibit of photographs of typical and atypical cases of scabies; photomicrographs of male and female acari and of burrows; photomicrographs of acari found in Norwegian, animal and avian scabies; photographs of scabietic chancres and photomicrographs of their burrows; photomicrographs and specimens of adult, nymphal and larval acari, ova, egg shells, scybala, and the skeletal parts of acari, illustrating the diagnosis of atypical cases of scabies by means of the "scrape and smear method."

BENJAMIN S. KLINE, Mount Sinai Hospital, Cleveland:

New Standard Antigen (Water Purified) for the Microscopic Slide Precipitation Tests for Syphilis: Exhibit presenting (a) demonstration of the method of removing impurities from standard slide test antigen (given quantity of antigen is added to one half as much water in an Erlenmeyer flask, the antigen wax is precipitated out by agitation and the impurities in solution are decanted); (b) demonstration of the greater specificity of the new standard antigen (water purified) as compared to old standard antigen using a special apparatus for chilling serums to increase nonspecific reactions; (c) protocols of comparative results of slide tests with the new standard antigen (water purified) and old standard antigen in syphilitic and nonsyphilitic cases.

DAVID C. ELLIOTT, Chicago; GEORGE BAEHR, New York; LOREN SHAFFER, Detroit; GLENN S. USHER, and S. ALLAN LOUGH, Washington, D. C., U. S. Public Health Service.

Syphilis—Massive Dose Therapy: Exhibit showing (1) schedules of therapy used in this clinical experiment; (2) exhibit of charts showing serologic responses to massive dose therapy; (3) reactions arising as the result of these treatment methods; (4) comparative therapeutic results—this method compared to current methods as practiced, and (5) list of contributors and list of authors.

Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A. Davis, Akron, Ohio.

RICHARD A. BOLT, Cleveland Child Health Association, Cleveland:

Education of Expectant Parents: Exhibit showing phases of classes for expectant parents; photographs of typical activities in classes for expectant parents; layette which mothers are taught to make in classes; chart showing reduction of maternal mortality in Cleveland; literature used in the classes.

ROBERT A. KEHOE, University of Cincinnati College of Medicine, Cincinnati:

Lead Poisoning: Exhibit of samples, miniatures, drawings and photographs illustrating sources of exposure; charts demonstrating physiologic reactions to various magnitudes of exposure, diagnostic criteria and methods of recognizing and measuring lead exposures.

W. W. BAUER and P. A. TESCHNER, Bureau of Health Education, American Medical Association, Chicago:

The Doctor's Office—A Health Information Center: Exhibit stressing the importance of the practicing physician and his office as a source of health information in the community. It describes the doctor's function through membership in the county medical society and as a participant in health programs sponsored by the society, including radio talks, addresses to assembled audiences, use of pamphlets, posters and simple visual material in his waiting room. The material which has been developed by the Bureau of Health Education of the American Medical Association as a means of helping doctors in these fields is briefly described.

BRUNO GEBHARD, Cleveland Health Museum, Cleveland:

Better Patients Through Health Education: Exhibit showing that the natural desire of people to know about themselves and their diseases has not been fully satisfied, up to now, by the medical profession and that health education activities must be enlarged in their scope and must be conducted more intensively. In order to keep the confidence of the public, the individual physician should be familiar with the technic of health education. Presentation of the different ways useful in health education (individual consultation, class instruction, information of the masses) and of the means, as the spoken and printed word, with special emphasis on the visual methods (lantern slides, movies, exhibits). Evaluation of the different mediums is based on experience gained at the Cleveland Health Museum.

GORONWY O. BROWN and R. A. MEZERA, St. Louis University School of Medicine, St. Louis:

Epidemiology of Encephalitis: Exhibit of maps and charts showing the seasonal distribution of cases of encephalitis in the United States between the years 1921 and 1938, with particular reference to the location and time of appearance of cases of those types of encephalitis which appear in summer months and such as St. Louis encephalitis and the Western and Eastern types of equine encephalomyelitis. Evidence is presented that simultaneously with the occurrence of epidemics of encephalitis in the vicinity of St. Louis there occurred a marked increase in cases of summer encephalitis in a large part of the United States. The inference is that sporadic cases of St. Louis encephalitis are probably of much wider distribution than is generally considered to be the case.

HOWARD E. SNYDER, Committee on Control of Cancer, Kansas Medical Society, Winfield, and BEN W. LOWTHER, State Board of Health, Topeka:

The Cancer Control Program in Kansas: Exhibit showing the cooperative plan for cancer control evolved by the Committee on Control of Cancer of the Kansas Medical Society, the Kansas State Board of Health and the Kansas Division of the Women's Field Army of the American Society for the Control of Cancer. The program of postgraduate education in cancer

for physicians is outlined. The plan, method and results of an educational program for the public are dealt with. The materials, including lantern slides and film strips, used in public meetings are displayed.

CARL M. PETERSON, Council on Industrial Health, American Medical Association, Chicago.

Industrial Health: Exhibit of charts and posters describing the importance of medical service in industry and means available to industrial physicians to participate in this type of activity.

R. R. SAYERS and H. H. SCHRENK, United States Bureau of Mines, Washington, D. C.:

Respiratory Protective Equipment in Mining and Industrial Work: Exhibit illustrating the correct usage of the various respiratory protective devices and pointing out the limits of their field of use.

E. G. MEITER, Employers Mutual Liability Insurance Company of Wisconsin, Wausau, Wis.:

Scientific Methods of Investigating and Preventing the Various Industrial Diseases and Hazards: Exhibit featuring both medical and engineering methods for the control of health and safety of industrial workers. Engineering control of industrial diseases are illustrated by instruments and devices used for detecting and measuring the toxic agents in air. With this equipment it is possible to collect atmospheric samples of dusts, fumes, vapors and gases in all types of industrial establishments. Representative respiratory protective devices and safety clothing are included. The accident prevention phases of the problem are devoted primarily to an exhibition of model dies designed for the elimination of punch press accidents.

LEWIS GREGORY COLE and WILLIAM GREGORY COLE, John B. Pierce Foundation, New York:

Unorthodox Microscopic Criteria of Silicosis and Gastric Neoplasms: Exhibit showing illustrations of dust with the light and dark fields, and the pathologic changes correlated with the roentgenologic findings.

A. W. SCHOENLEBER, W. J. DENNO, J. A. ADAMS, R. C. PAGE, ALFRED GAGE and T. C. KIENZLE, Standard Oil Company of New Jersey, New York:

Medical Service in Industry: Exhibit of a chart denoting number and distribution of staff; map showing location, medical personnel and number of people cared for during 1940; medical annual report of one subsidiary company for 1940; annual medical statistical report of one subsidiary company for 1940; annual statistical report for all companies which come under the medical supervision of the New York Office for 1940; and a series of charts with photographs and illustrations of industrial medical problems in South America, Netherlands, East and West Indies and other regions.

LOWELL S. SELLING, Psychopathic Clinic, Recorder's Court, Detroit:

Examination and Treatment of the Traffic Offender: Exhibits of transparencies showing (1) the history of the Recorder's Court Traffic Clinic; (2) the route that the patient takes through the various examinations: physical, psychologic, psychophysical and psychiatric; the administrative setup; the special type of examination carried out in the Traffic Clinic: first the physical, second the ophthalmologic, third the psychologic, fourth the psychiatric, and staff conference of the cases.

Section on Urology

The representative to the Scientific Exhibit from the Section on Urology is John H. Morrissey, New York:

W. RAY JONES, King County Hospital System, Seattle:

Microslide Diagnosis of Atypical Gonorrhea: Exhibit showing improved equipment for securing better slides, and illustrations of their use; drawings of elements in the microfield and their interpretations; photomicrographic transparencies showing illustrative fields and interpretations. Irregularities peculiar to each sex are shown.

ROGER W. BARNES, ALBERT F. BROWN and NEWTON EVANS, College of Medical Evangelists, Los Angeles:

Carcinoma of the Prostate—Correlation Between Histopathology and Clinical Course: Exhibit of photomicrographs demonstrating the various histopathologic criteria used in grading the degree of malignancy in carcinoma of the prostate; charts and graphs showing the correlation between these criteria and the clinical course of the patient. The study is based on the material from 100 cases which were followed until death or a survival of five years.

CHARLES HUGGINS, GEORGE GOMORI, C. V. HODGES and W. W. SCOTT, University of Chicago, Chicago:

Phosphatases and Carcinoma of the Prostate Gland: Exhibit showing methods of demonstrating the intracellular distribution of phosphatases; the metabolism of these enzymes and their relationship to carcinoma of the prostate is shown; the endocrine status of prostatic carcinoma and methods of inhibition are presented.

JAMES J. JOELSON and CHARLES L. HUDSON, Medical School, Western Reserve University, Cleveland:

Tumors of the Adrenal Gland: Exhibit showing clinical and diagnostic studies (including pathologic studies) in cases of tumor of the adrenal—cortical adenomas, pheochromocytomas and carcinomas.

HARRY R. TRATTNER, Cleveland City Hospital and Western Reserve University, Cleveland:

Tubuloalveolar Injection of the Prostate by Partition Catheter: Exhibit depicting the apparatus, anatomy concerned, technique and histologic proof of the introduction of solution into the prostatic tree via the duct orifices of the gland. The following may be accomplished by the method: (1) roentgen visualization of the prostate (prostatography), (2) therapy in cases of chronic intractable prostatitis, (3) removal of prostatic secretion at the site of the prostatic duct orifices and (4) aid in diagnosis and treatment of certain lesions of the prostatic urethra. The catheter has been used in 50 cases thus far, and indications and contraindications are given for its use.

CHARLES C. HIGGINS, Cleveland Clinic, Cleveland:

Renal Lithiasis, an Experimental and Clinical Study: Exhibit consisting of transparencies, charts, dietary routines, illustrations in experimental work in the production of the urinary calculi, preoperative investigation, preoperative procedures to be employed and measures to be utilized postoperatively to prevent a recurrence; roentgenograms of a group of patients in whom dissolution of renal calculi has been secured by dietary means.

Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is Theodore A. Willis, Cleveland.

CLAY RAY MURRAY and STEPHEN S. HUDACK, College of Physicians and Surgeons, Columbia University and Presbyterian Hospital, New York:

Rigid Internal Fixation in Fractures of the Long Bones: Exhibit demonstrating the rigidity of fixation necessary to allow active mobilization after operative reduction of long bone fractures in the adult, and the material and instruments used to get it; lack of rigidity in many of the forms of fixation commonly used is demonstrated; the effects of active function with rigid and nonrigid fixation in the production of bone absorption about the fixation material is demonstrated in gross specimens, roentgenograms and photomicrographs. The type of apparatus used in mobilization is demonstrated by model.

SAM W. BANKS, Department of Surgery, University of Chicago, Chicago:

Aseptic Necrosis of Femoral Head After Traumatic Dislocation of Hip: Exhibit consisting of roentgenograms of nine cases of traumatic dislocations of the hip which were followed by aseptic necrosis of the femoral head with roentgen changes interpreted in terms of the pathologic alterations; the cases

demonstrate the characteristic clinical, pathologic and roentgenographic features of this condition; a summary of fifty cases in the literature is included, forty-two of which have resulted in deformed and painful hips, emphasizing the importance of prolonged observation of all cases of traumatic dislocations so that the complication of aseptic necrosis can be recognized early before collapse of the head has occurred and which may preclude the possibility of a satisfactory outcome.

R. ARNOLD GRISWOLD, W. B. OWEN, R. T. HUDSON and C. F. WOOD, University of Louisville School of Medicine and Louisville City Hospital, Louisville, Ky.:

Fractures of the Humerus Treated by the Hanging Cast: Exhibit of photographs, anatomic drawings and charts illustrating the treatment of fractures of the humerus with the hanging cast; the simplicity and effectiveness of the method are stressed along with its adaptability to most cases; results in a series of more than 300 fractures are presented.

JAMES A. DICKSON, J. I. KENDRICK, W. JAMES GARDNER, A. T. BUNTS and W. A. NOSIK, Cleveland Clinic, Cleveland:

Thorotrast Myelography for Herniated Disk Localization: Exhibit showing that thorotrast is superior to either air or iodized poppy-seed oil as a medium for roentgen ray visualization of the lumbar spinal canal. It gives a more complete picture and can subsequently be removed by forced spinal drainage; it is probably less irritating than iodized oil and is particularly useful in the study of patients suspected of having a protrusion of the intervertebral disk. In the past three years more than 100 cases were studied by this method at the Cleveland Clinic, and a consecutive series of routine spinograms is presented. A pictorial presentation demonstrates the procedure of injection and the roentgen ray technic. Further illustration shows the method of forced spinal drainage by which it is possible to remove the greater percentage of injected material.

G. E. HAGGART and JAMES W. TOUMEY, The Lahey Clinic, Boston:

Surgical Approach to the Shoulder Joint: An exhibit of colored drawings of the anatomy of various operative procedures in the region of the shoulder joint, with roentgenograms illustrating types of pathologic conditions encountered as well as photographs of the preoperative and postoperative states.

WALTER A. HOYT, ADRIAN E. DAVIS and GEORGE VAN BUREN, Akron Children's Hospital, Akron, Ohio:

The Treatment of Acute Osteomyelitis by Sulfathiazole Without Operation: Exhibit showing roentgenograms of patients with acute osteomyelitis treated by sulfathiazole without operation; the series presents roentgenograms before any bone changes are apparent and at monthly intervals, up to nine to ten months after the onset of the disease; no operative procedure was carried out in any case. Photographs of patients are shown as well as the clinical charts representing temperature curves, blood counts, sulfathiazole blood level and dosage of the drug. Comparative roentgenograms in operative and nonoperative cases are included, as well as additional charts on osteomyelitis, showing the number of patients treated, bones involved and end result studies.

Section on Gastro-Enterology and Proctology

The representative to the Scientific Exhibit from the Section on Gastro-Enterology and Proctology is Sara M. Jordan, Boston.

RICHARD B. CATTELL, N. W. SWINTON and E. D. KIEFER, The Lahey Clinic, Boston:

Complete Colectomy for Intractable Ulcerative Colitis: Exhibit showing the indications for removal of the colon in intractable ulcerative colitis, the operative technic of these procedures, roentgenographic and specimen demonstration of pathologic changes and end results obtained in a series of 35 cases.

JAY M. GARNER and J. PEERMAN NESSELROD, Evanston Hospital and Northwestern University, Evanston, Ill.:

Proctosigmoidoscopic Color Photography: Exhibit of transparencies of the normal appearance of the lower portion of the

sigmoid, rectum and anal canal together with views of the pathologic conditions of these structures; these pictures, obtained through the proctoscope, afford the observer an opportunity to view what the endoscopist sees during a routine examination; charts and posters facilitate an understanding of the equipment used.

ALVIN L. BERMAN, F. S. GRODINS and A. C. IVY, Northwestern University Medical School, Chicago:

The Rationale of Bile Salt Therapy: Exhibit of charts, posters and graphs illustrating the results obtained from the administration of various therapeutic substances such as bile salts, alcohol, cinchophen and others. Correlation of these results with medical problems in liver, gallbladder and biliary tract disease will be made. Roentgenograms of the gallbladder under the action of various emptying substances will be shown. The effect of blood flow on the formation of bile and a model of a thermostromuhr will be demonstrated. There will be a display of all the known and currently used bile salts, both synthetic and naturally isolated.

HENRY A. RAFSKY, Lenox Hill and Beth Israel Hospitals, New York:

Comparative Roentgenographic, Endoscopic and Photographic Studies of the Stomach: Exhibit of a series of roentgenographic, endoscopic and photographic studies of the stomach from patients presenting diagnostic and therapeutic problems; the results of these investigations were compared with the subsequent clinical course as well as the operative and pathologic observations; the methods by which the areas to be photographed were located are described. The photographs were taken in black and white, and in some instances colored photography was employed. The comparative observations and their clinical correlation are illustrated by transparencies describing the case reports; the camera with flexible tube attached is demonstrated.

JEROME M. LYNCH and J. G. HAMILTON, Polyclinic Hospital, New York:

Cancer of the Caudal Bowel: Exhibit depicting forty-nine years' experience with all types of operations for the cure of cancer of the caudal bowel; the relative frequency, sites and pathways of metastatic involvement are shown; the results of the first five years of the Lynch operation are summarized.

Z. BERCOVITZ and M. CHRISTENSEN, New York Post-Graduate Hospital and Medical School, New York:

Chronic Ulcerative Colitis versus Lymphopathia Venereum: Exhibit showing the relationship between chronic ulcerative colitis and lymphopathia venereum, demonstrated by cellular exudate studies in both conditions; the results of intradermal testing of patients (Frei test) with chronic ulcerative colitis using human antigen, mouse brain control and antigen and egg yolk control and antigen are shown, and these are compared with known cases of lymphopathia venereum.

Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S. W. Donaldson, Ann Arbor, Mich.

ROBERT J. REEVES, Duke University, Durham, N. C.:

Bronchomycosis: Exhibit of case histories and roentgenograms of the chests in cases of fungous infections of the lungs. The roentgen diagnosis and short routine of treatment are included.

LOWELL S. GOIN and EUGENE F. HOFFMAN, Los Angeles:

Contact Roentgen Ray Therapy in Cancer of the Bladder: Exhibit of placards giving salient points of methods, photographs of apparatus, photomicrographs of bladder cancers before and after treatment and tabular résumé of fifteen cases treated.

JOSEPH S. BARR, JAMES R. LINGLEY, and EDWARD A. GALL, Massachusetts General Hospital, Boston:

The Effect of Roentgen Ray Irradiation on the Growing Epiphysis, Experimental Observations: Exhibit of roentgenograms, photomicrographs and the like, demonstrating the effect

of varying dosages of roentgen rays on the growing epiphyses of albino rats. The effect on juxtaepiphyseal tissues is also noted.

H. E. KLEINSCHMIDT, National Tuberculosis Association, New York, and S. REID WARREN JR., Moore School X-Ray Laboratory, Philadelphia:

Chest Roentgen Ray Methods: Exhibit showing comparison of various methods of making chest roentgenograms, in private practice and for mass surveys, with brief comments on advantages and disadvantages of each method. The methods included are fluoroscope, single film, stereoscopic films, paper roll, fluorography with 35 mm. film and fluorography with 4 by 5 inch film. Each method will be shown by (a) diagram illustrating the basic physical principles, (b) photograph of the apparatus, (c) actual roentgenograms, (d) brief comments. The roentgenograms and photographs are all of the same patient.

JOHN T. MURPHY and C. E. HUFFORD, Toledo, Ohio:

Bone Tumors: Exhibit of bone abnormality correlating the clinical with the roentgenologic and pathologic changes, showing cases which have been followed either until death or long enough to give reasonable assurance that correct clinical conclusions can be drawn. There are differences between the roentgen and the pathologic diagnoses in some of the cases, and the subsequent clinical course often determined which one was correct; the clinical course is the most important factor in determining the correct diagnosis. Roentgenograms made at frequent intervals allow a study of the changes which occur as the disease progresses or as the condition improves. The original microscopic slides will be available for study.

Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Paul M. Wood, New York.

GEORGE J. THOMAS and GEORGE W. JONES, University of Pittsburgh School of Medicine, St. Francis Hospital and U. S. Bureau of Mines:

Prevention of Explosions of Combustible Anesthetic Agents by the Addition of Helium: Exhibit of graph showing explosive ranges of cyclopropane-oxygen-helium mixtures, ether-oxygen-helium mixtures, ethylene-oxygen-helium mixtures; charts showing the ignition temperature of various combustible anesthetic agents and the limits of flammability of combustible anesthetic agents; graphs showing cyclopropane-ethylene-oxygen mixtures and the flammable limits by static and induction coil spark ignition of cyclopropane-oxygen-helium mixtures.

MEYER SAKLAD, Rhode Island Hospital, Providence, R. I., and W. ALLEN CONROY, Wisconsin General Hospital, Madison, Wis.:

The Punch Card Method for the Collection and Analysis of Surgical and Anesthetic Statistics: Exhibit showing, (1) by the use of diagrams and charts, the reasons why factual data should be recorded and why, by the recording, collection and analysis of data, progress in medicine will result; (2) a step by step explanation of coding, punching and sorting; (3) collected statistics and the role they may play on determining the relative value of anesthetic and surgical procedures.

URBAN H. EVERSOLE, LEO V. HAND and MORRIS J. NICHOLSON, Lahey Clinic, Boston:

Suction Therapy in Prevention and Treatment of Pulmonary Complications: Exhibit of charts, roentgenograms and illustrations demonstrating the etiology of postoperative pulmonary complications, their prevention and treatment by bronchoscopic aspiration and results obtained by such treatment.

THOMAS H. SELDON and JOHN S. LUNDY, Institute of Experimental Medicine, Mayo Foundation and Section on Anesthesia, Mayo Clinic, Rochester, Minn.:

Effect of Certain General Anesthetic Agents on the Small Vessels of the Rabbit's Ear: Exhibit shows (1) the technic of inserting a Clark-Sandison window used in observation of the growth of small vessels in the rabbit's ear (enlarged model shows detail of window); (2) a series of photographs showing

the stages of ingrowth of small vessels into the window at the end of five days, seven days, twelve days, fourteen days and nineteen days, and (3) photomicrographs of arterioles and capillaries taken before and after the animal is placed under the effect of the following general anesthetic agents: pentothal sodium, cyclopropane and oxygen, nitrous oxide and oxygen, ethylene and oxygen, and drop ether.

F. A. D. ALEXANDER, H. E. HIMWICH and VICTOR TOMPKINS, Albany Hospital and Albany Medical College, Albany, N. Y.:

Resuscitation of the Newborn: Pathology and Physiology: Exhibit of (1) demonstrations of the underlying principles of resuscitation for the newborn with particular reference to the complications and limitations of the commonly used procedures; (2) gross and microscopic demonstrations of tissues of newborn infants to illustrate some of the reasons for failure in attempts at resuscitation; (3) charts demonstrating the vital physiology of the newborn with particular reference to their extraordinary tolerance to hypoxia, anoxia and hypoglycemia as compared with the adult.

HENRY S. RUTH, IVAN B. TAYLOR and FREDERICK P. HAUGEN, Hahnemann Medical College and Hospital, University of Pennsylvania Hospital and Presbyterian Hospital, Philadelphia:

Serial Spinal Anesthesia: Exhibit of equipment for doing serial spinal anesthesia and a model to demonstrate the technic of various operative positions; anesthesia records illustrating various applications and the dosages employed; lantern slides will be shown.

HARVEY C. SLOCUM, Wisconsin General Hospital, Madison, Wis.:

Observations on Respiration and Circulation: Exhibit presenting a demonstration of a new automatic recorder for systolic and diastolic blood pressure and a spirometric recording of respiratory rate, tidal volume and oxygen consumption; charts showing synchronous blood pressure and spirometric records of the effects of various sedatives and narcotics, oxygen want, carbon dioxide excess and other physiologic changes.

E. A. ROVENSTINE, STEVENS J. MARTIN and C. L. BURSTEIN, New York University College of Medicine, New York:

Reflexogenic Complications During Anesthesia: Exhibit of charts and model constructed to demonstrate the more significant reflex changes occurring during surgical anesthesia; the influence of premedication, anesthetic agent used, depth of anesthesia and surgical manipulations in the neck, chest and abdomen are presented, and recent laboratory and clinical studies emphasize the effects produced and the therapeutic measures indicated.

MOTION PICTURES

The following motion pictures will be shown in several areas adjoining the exhibit hall continuously throughout the week. Each picture will be shown once each day:

Surgery

R. M. KLEMME, St. Louis:

Surgical Treatment of Paralysis Agitans and Athetosis.

D. HENRY POER, Piedmont Hospital, Atlanta, Ga.:

Peripheral Vascular Conditions Seen in Southern Clinic.

HUGH A. GAMBLE, Gamble Brothers and Archer Clinic, Greenville, Miss.:

Plication Operation for Control of Adhesions and Prevention of Intestinal Obstruction.

GUY W. HORSLEY, St. Elizabeth's Hospital, Richmond, Va.:

Appendicitis, Operative Technic and Results.

K. J. HENRICHSEN, Chicago Municipal Tuberculosis Sanatorium, Chicago:

Surgical Procedures in Treatment of Pulmonary Tuberculosis.

GROVER C. PENBERTHY, Children's Hospital, Detroit:

Treatment of Burns.

HENRY N. HARKINS, Henry Ford Hospital, Detroit:
The Treatment of Burns.

CHARLES GORDON HEYD, New York Post-Graduate Medical School and Hospital, New York:

Subtotal Resection of Thyroid Gland for Hyperthyroidism—Graves' Disease Type.

ALFRED H. IASON, Manhattan General Hospital, Brooklyn:
Embryology, Anatomy and Surgery of Hernia.

RICHARD E. HELLER, Northwestern University Medical School, Chicago:

Varicose Veins and Their Complications.

FRED W. RANKIN, St. Joseph's Hospital, Lexington, Ky.:
Operations for Resecting the Colon.

FRANK H. LAHEY, The Lahey Clinic, Boston:
The Technic of Subtotal Thyroidectomy for Exophthalmic Goiter.

Subtotal Gastrectomy with Antecolic Anastomosis of Large Perforating Duodenal Ulcer with Pyloric Obstruction Adherent to Common Duct.

Subtotal Gastrectomy and Resection of Jejunum with Transposition of the Jejunal Stump and Lateral Anastomosis of the Jejunum to the Right of the Mesenteric Root, for Gastro-jejunal Ulcer Adherent to the Transverse Colon.

HARRY KOSTER, Crown Heights Hospital, Brooklyn:
A Method for Preventing or Diminishing Peritonitis from Leakage After Intestinal Resection of Perforation.

LOUIS RENE KAUFMAN, New York Medical College, New York:

Operation of Appendicocostomy.

WALTMAN WALTERS, HOWARD GRAY and JAMES T. PRIESTLEY, Mayo Clinic, Rochester, Minn.:

Resection of the Stomach for Carcinoma.

Cancer

G. V. BRINDLEY, Scott and White Hospital, Temple, Texas:
Carcinoma of the Large Intestine.

ARNOLD S. JACKSON, Jackson Clinic, Madison, Wis.:
Surgical Treatment of Malignant Diseases of the Gastro-intestinal Tract.

FRANK H. LAHEY, The Lahey Clinic, Boston:
Two Stage Resection of Right Colon for Carcinoma of Cecum.

JEROME M. LYNCH, Polyclinic Hospital, New York:
Cancer of the Caudal Bowel.

FRED W. RANKIN, St. Joseph's Hospital, Lexington, Ky.:
One Stage Combined Abdominoperineal Resection for Carcinoma of the Rectum.

GEORGE T. PACK, Memorial Hospital for Cancer and Allied Diseases, New York:

Groin Dissection for Metastatic Melanoma.

Abdominoperineal Resection of Rectum for Cancer.

Transpleural Resection of Cardia of Stomach and Terminal Esophagus for Cancer.

LOWELL S. GOIN, Los Angeles:
Low Voltage Contact Roentgen Radiation in the Treatment of Cancer of the Bladder.

JOHN H. LAMB, Lain-Eastland-Lamb Clinic, Oklahoma City:
Treatment of Cancer of the Lower Lip by Interstitial Radiation.

G. ALLEN ROBINSON, New York:
The Physics and Therapeutic Uses of Radium.

Plastic Surgery

SAMUEL COHEN, Graduate School of Medicine, University of Pennsylvania, Philadelphia:

Plastic Surgery of Nose and Face.

GEORGE D. WOLF, Metropolitan Hospital, New York:
Rhinoplasty in Relation to Rhinology.

MORTIMER KOPP, Lutheran Hospital, Brooklyn:
Rhinoplastic Procedure.

JAMES BARRETT BROWN, Washington University School of Medicine, St. Louis:

Reconstruction of Cleft Lips.

J. EASTMAN SHEEHAN, New York Polyclinic Medical School and Hospital, New York:

Cinematographic Presentation of Plastic Operations in Natural Colors.

CLAIRE L. STRAITH, Detroit:

Hump Nose Correction.

Saddle Nose Correction.

D. M. GLOVER, St. Luke's Lakeside and City Hospitals, Cleveland:

Repair of the Harclip.

MORTON I. BERSON, Downtown Hospital, New York:
Plastic and Reconstructive Surgery.

GUSTAVE AUFRICHT, New York Post-Graduate Medical School and Hospital, New York:

Correction of Chin Deformities.

Surgical Anatomy

CONRAD J. BAUMGARTNER, Los Angeles:

Surgical Anatomy of the Thyroid.

Surgical Anatomy of the Upper Part of the Neck.

Surgical Anatomy of the Extrahepatic Biliary System.

Surgical Anatomy of the Stomach, Duodenum and Pancreas.

Surgical Anatomy of the Small and Large Intestine.

Surgical Anatomy of the Female Pelvic Organs, Ureters and Bladder.

Surgical Anatomy of the Female Perineum.

Surgical Anatomy of the Breast and Axilla.

Surgical Anatomy of the Arm and Forearm.

Surgical Anatomy of the Hand.

Surgical Anatomy of the Lower Extremities.

Practice of Medicine

NATHAN SMITH, Morrisania City Hospital, New York:
The Education of the Intern.

JOHN D. CURRENCE, New York Post-Graduate Medical School and Hospital, New York:
Technic of Massage.

NORMAN PLUMMER, Cornell University Medical College, New York Hospital, New York:

Pneumonia: Diagnosis and Treatment.

LEANDRO M. TOCANTINS, Jefferson Medical College of Philadelphia, Philadelphia:

Infusion of Blood into the Circulation via the Bone Marrow.

GORDON B. MYERS, FRED MARGOLIS and MUIR CLAPPER, Wayne University College of Medicine, Detroit:

Physical Diagnosis.

WILLIAM B. KOUNTZ and JOHN R. SMITH, Washington University School of Medicine, St. Louis:

Vibrocadiographic and Cinematographic Studies of Myocardial Motions in Normal and Pathologic Conditions.

CLAYTON J. LUNDY, Rush Medical College, Chicago:

Heart Sound Records.

The Common Digitalis Effects on the Electrocardiogram.

Nervous and Mental Diseases

A. E. BENNETT, Bishop Clarkson Memorial Hospital, University of Nebraska, Omaha:

The Technic of Electroencephalography.
New Modifications of Convulsive Shock Therapy.

J. RUDOLPH JAEGER, University of Colorado, Denver:
Intervertebral Disk Injury with Herniation of Nucleus Pulposus.

WALTER FREEMAN, George Washington University, Washington, D. C.:

Agitated Depression Treated by Prefrontal Lobotomy.

HENRY R. VIETS, Massachusetts General Hospital, Boston:
Myasthenia Gravis, the Erb-Goldflam Syndrome.
Myasthenia Gravis, Report of a Case of Dysarthria.

Dermatology and Syphilology

HAMILTON MONTGOMERY, Mayo Clinic, Rochester, Minn.:
Cutaneous Xanthomatosis.

PAUL A. O'LEARY, Mayo Clinic, Rochester, Minn.:
The Dermatosclerotics.

FRANK E. SIMPSON, Chicago:
Radium Treatment of Angiomas.

A. BENSON CANNON, Vanderbilt Clinic, New York:
The Syringe Technic in the Administration of Old Arsphenamine.

The Treatment of Neurosyphilis by Intraspinal Injection of Arsphenaminized Serum—Swift-Ellis.

Common Infectious Diseases of the Skin (lantern slide demonstration).

War Medicine

WALTER M. BOOTHBY, Mayo Clinic, Rochester, Minn.:

Research in Aviation Medicine.
Psychologic Problems in Aviation Medicine.

JOSEPH M. HILL, Baylor University Hospital, Dallas, Texas:
The Preparation of Concentrated Plasma.

GORDON B. NEW and JOHN B. ERICH, Mayo Clinic, Rochester, Minn.:

Immediate and Late Treatment of Traumatic Injuries of the Face.

E. S. GURDJIAN, Wayne University College of Medicine and Grace Hospital, Detroit:

Operative Management of Acute Head Injury.

Urology

FRANK HINMAN, University of California Hospital, San Francisco:

Ureterointestinal Implantation with a Divisible Carrier.

EDWIN DAVIS, Omaha:
The Technic of Perineal Prostatectomy.

WALTER M. KEARNS, Milwaukee:
Testicular Deficiency.

CARLISLE F. SCHROEDER, Charles Godwin Jennings Hospital, Detroit:

Denerivation of the Painful Bladder.

CARL RUSCHE, University of Southern California School of Medicine, Los Angeles:

Radical Operation for the Cure of Rectourethral Fistula Following Perineal Prostatectomy.

J. JAMES DUFFY, Los Angeles:
The Duffy Trocroscope for Suprapubic Cystotomy and Cystoscopy.

ELMER BELT and A. W. FOLKENBERG, Los Angeles:
Perineal Prostatectomy for Benign Hypertrophy.
Radical Perineal Prostatectomy for Malignant Hypertrophy.
Nephropexy.

JAMES T. PRIESTLEY, Mayo Clinic, Rochester, Minn.:

Nephrolithotomy for Staghorn Renal Calculus.
Hydronephrosis (Resection of Renal Pelvis and Reimplantation of Ureter.)

FREDERIC E. B. FOLEY, St. Paul:

Operative Division of the Unilateral Fused Kidney.
Foley Y-Plasty, a New Operation for Relief of Stricture at the Ureteropelvic Junction.

ROGER W. BARNES, College of Medical Evangelists, Los Angeles:

Surgical Treatment of Vesical Diverticula.

Obstetrics

CARL HENRY DAVIS, Wilmington, Del.:

Obstetric and Gynecologic Problems.

W. C. DANFORTH, Evanston Hospital, Evanston, Ill.:
Total Abdominal Hysterectomy—Three Cases.

I. C. RUBIN, New York:
Uterotubal Insufflation: A Test for Tubal Patency in Sterility.

E. H. KLOMAN, Maryland General Hospital, Baltimore:
Operative Repair of Vesicovaginal Fistula.

Miscellaneous Subjects

EDWIN N. BROYLES, Johns Hopkins Hospital, Baltimore:
Laryngectomy, Crowe-Broyles Technic.

ROBERT HENNER, Illinois Eye and Ear Infirmary, Chicago:
Hearing Tests (slide films with sound).

ANTHONY P. GULOTTA, New York:
Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis.

ADOLPH A. SCHMIER, Hospital for Joint Diseases, New York:
A Muscle Tester for Poliomyelitic Patients.

LEWIS GREGORY COLE, St. Agnes Hospital, White Plains, N. Y.:
Unorthodox Microscopic Criteria of Silicosis and Gastric Cancer.

HOWARD E. SNYDER, Winfield, Kan.:
The Ambulatory Management of Fractures of the Lower Extremities.

J. E. M. THOMSON, Lincoln, Neb.:
Fractures of the Patella (Treated by Plastic Repair of Tendon).

JAY M. GARNER and J. PEERMAN NESSELROD, Evanston Hospital, Evanston, Ill.:
Proctoscopic Cinematography.

GARNET W. AULT, Washington, D. C.:
Resection of Polyp by Sigmoidotomy.

L. W. SAUER, The Cradle, Evanston, Ill.:
The Cradle.

PHILLIPS THYGESON, Institute of Ophthalmology, Presbyterian Hospital, New York:
The Bacteriologic Diagnosis of Ocular Diseases.

LOUIS LEHRFELD, Wills Eye Hospital, Philadelphia:
Corneal Episcleral Sutures in Cataract Extraction.

ALVAN L. BARACH, Columbia Presbyterian Medical Center, New York:
Effect of Equalizing Thoracic Pressure, Oxygen and Helium on Respiratory Movement.

NEWER DRUGS
LATEST BOOKS
IMPROVED APPARATUS
AND INSTRUMENTS
SPECIAL FOODS
MEDICAL SUPPLIES

Today almost every one senses the vital importance of close cooperation between science and industry. Medicine is no exception. A new development emerges from the test tube—or reveals itself under the microscope—or rises up from painstaking clinical investigation. But to make such a development of practical value and generally available to physicians, the understanding cooperation of industry is needed.

The Technical Exposition in the main Exhibit Hall of Cleveland Auditorium will present the outstanding results of this cooperation between medical science and medical industry. Here the physician will find the most important contributions of more than 200 firms presented for his consideration—Apparatus and Instruments, Diagnostic Equipment, Dietetic Products, Hearing Aids, Medical Books, Office Furniture, Optical Instruments, Pharmaceuticals and Biologicals, Physical Therapy and X-Ray, Special Apparel, Surgical Supplies, Toilet Preparations, X-Ray Supplies, and Miscellaneous.

With this vast array of equipment and supplies displayed in attractive booths, by courteous, specially informed attendants, with Registration Headquarters, U. S. Post Office, and Visitors' Lounges in the same hall, the visiting physician will find it profitable, pleasurable, and stimulating to spend adequate time in Exhibit Hall.

Exhibitors will be there to give information, to serve their medical friends, rather than to exert high pressure sales efforts. No visitor should hesitate to stop at any exhibit and ask questions.

The Exposition will be open each day from 8:30 a. m. to 6:00 p. m. It will close Friday at noon. To show the highlights of The Technical Exposition, and to give a general idea of what may be found in each booth, browse through the following pages which contain brief descriptive items under each firm name.

WILL C. BRAUN, *Director of Exhibits*

APPARATUS AND INSTRUMENTS

A. S. ALOE COMPANY
Booths 287, 288, 289

The exhibit will present a complete line of American-made stainless steel and chrome surgical instruments. Aloe Steel-line Furniture for the physician will also be featured. Specialties will include the Aloe Diagnostic X-Ray, new models of Aloe Short Wave apparatus, an improved electrocardiograph and many other new items. A special display of clinical laboratory apparatus and supplies will be offered.

AMERICAN CYSTOSCOPE MAKERS, INC.
Booth 284

A cordial invitation is extended to doctors to visit this modern display of A. C. The latest in modern and operating instruments, including the Rud-dock Peritoneoscope, the Wappler Cold Cautery Scalpel, the new Wappler Surgical Unit, and the new Nylon Woven Catheters. Made in America, these ureteral x-ray and non-x-ray catheters are boilable and may also be autoclaved.

AMERICAN SAFETY RAZOR CORPORATION
Booth 167

For complete information on A.S.R. Surgeon's Blades visit the booth. Meet the company representatives, who, can answer questions about these Surgeon's Blades. They will gladly explain the various uses of the blades—9 types in all.

(Continued on next page)

AMERICAN STERILIZER COMPANY
Booth 144

A display of typical modern office types of sterilizers will appear in this exhibit. Attendants will be on hand to welcome you and discuss the equipment with you.

BARNETT LABORATORIES
Booth 473

In addition to their regular line of clinical photographic apparatus, the Barnett Laboratories will exhibit a new low priced stereo eye camera. Owners of Leica, Contax, Exakta, and other cameras are invited to stop at the booth, and see how these cameras can be easily and economically adapted for clinical photography by using Barnett's Synchronized Flood Lighting System.

CAMERON SURGICAL SPECIALTY CO.
Booths 128 and 411

Here visitors may see the new Cameron-Schindler Flexible Gastroscope, the Color-Flash Clinical Camera, the Projecto-ray, the Mirro-lite and latest developments in electrically lighted diagnostic and operating instruments for all parts of the body. Of special interest will be the new inexpensive office model Radio Knife, Combination Spark Gap and Tube Electro-Surgical Unit, and other electro-surgical units for cutting, coagulating, desiccation, fulguration and ultraviolet therapy in all sizes.

WILMOT CASTLE COMPANY
Booth 304

During these days of increasing demands upon medical men, modern sterilizing and lighting equipment will help promote efficiency. A complete exhibit of the Castle sterilizers and lights for offices, clinics and industrial first-aid rooms will be shown at the exhibit.

CAYO COMPANY
Booth 114

All surgeons, particularly those interested in bone surgery, will be welcome to any information that can be given regarding the use and care of Cayo Bone Instruments. An attendant will be present at all times to demonstrate the instruments and distribute literature.

CRESCENT SURGICAL SALES CO., INC.
Booth 156

When you visit the miniature operating room at the Crescent exhibit, you will find every piece of equipment built to scale, including the operating room, nurse and surgical staff. Ask for your souvenir knife—made with a standard Crescent detachable surgeon's blade—and presented to you as visible evidence that Crescent surgeons' blades have sharper cutting edges, one-third more steel, balanced weight distribution.

FOREGGER COMPANY, INC.
Booth 135

On display for Foregger is their resuscitation and anesthesia apparatus, including the O.F. type anesthesia apparatus. You will find some interesting equipment worth your investigating at this booth.

L. G. GALBRAITH
Booth 515

General practitioners will be interested in this exhibit of the Ross Circumcision Ring, a new development which simplifies the operation, tends to prevent postoperative bleeding and adhesions, to minimize distress and improve cosmetic results. You are invited to discuss this new method with the representative in charge of the exhibit.

GOMCO SURGICAL MFG. CORP.
Booth 320

The Gomco Corporation will exhibit their new line of Underwriters approved suction and other units, their new centrifuges and their new thermotic bladder drainage units, breast pumps, circumcision and umbilical clamps.

KITCHEN KATCH-ALL CORPORATION
Booth 162

In this exhibit may be seen a demonstration of the Baby-All Formula Sterilizer Outfit, a miniature hospital outfit easily operated by mothers. Also on display will be the new model Vapor-All Vaporizer

Humidifier, with special emphasis on the All-Nite model, which operates continuously for twelve hours.

V. MUELLER & COMPANY
Booths 215 and 216

This exhibit will present a complete line of fine American made, stainless steel instruments for various specialized branches of surgery. Several new Mueller specialties will be shown.

PELTON & CRANE COMPANY
Booth 166

All popular models featured by this company, inch office autoclave, Also, the regular lin sterilizers, office lights and cuspidors.

PROMETHEUS ELECTRIC CORP.
Booth 478

A wide range of infra-red lamps, operating lights, sterilizers and autoclaves will be displayed by Prometheus. Especially worthy of note is the revolutionary new "Space Saver" Cabinet Sterilizer, scientifically designed for the professional office.

RITTER EQUIPMENT COMPANY, INC.
Booth 302

In its second appearance at an A. M. A. Convention, the Ritter Company will show the following new items: surgical cuspidor, bone surgery engine, and a redesigned ENT Unit. Other articles to be shown include: sterilizers, compressors, fluorescent lights, x-rays, ENT chairs and stools. Improved models of products shown last year will also be displayed.

SAFETY GAS MACHINE CO., INC.
Booth 112

Latest McCurdy and Augustana models will be shown here. These machines are Council accepted. The exhibit will be in charge of an experienced anaesthetist who invites consultation on anaesthetic problems.

SCANLAN-MORRIS COMPANY
Booths 139 and 140

Of special interest to surgeons will be the demonstrations of a new operating table for general surgery, also a new raise-and-lower obstetric table built with disappearing leg section which permits quick adjustment to delivery position. Surgical lights, portable and ceiling-hung models, sterilizers, SterilBrite aluminum surgical furniture, and Stille Swedish-made surgical instruments will also be exhibited.

J. SKLAR MANUFACTURING CO.
Booth 256

Visitors will find here a comprehensive exhibit of new suction and pressure apparatus, including the Improved Tompkins Portable Rotary Compressor, the DeLux Tompkins, the new Imperator Apparatus for ear, nose and throat, Ralk's Ideal Unit and Moorhead Unit for office and clinic, and the new hospital model of the Bellevue Suction and Pressure Unit. In addition, a complete display of Sklar's American made stainless steel surgical instruments will be shown.

U. M. A., INC.
Booth 103

U. M. A. will show the new improved Collwill Intermittent Venous Occlusion Apparatus—the original apparatus devised by Drs. Collens and Wilensky. Also, U. M. A. is showing the Collens Syhgyomo-Oscillometer, a diagnostic instrument which combines a sphygmomanometer with an oscillometer.

UNION CARBIDE COMPANY
Booth 251

On display will be Linde Oxygen U.S.P., the Linde R-50 Oxygen Therapy Regulator, and the Linde L-14 Oxygen Therapy Station Flow-meter, also various types of small portable oxygen administering apparatus. Representatives will discuss the latest developments in oxygen therapy, and provide information on the mechanical and management aspects of administering oxygen in the hospital or the home. Reprints of several recent articles on the subject from leading medical journals will be available.

**W. A. BAUM COMPANY, INC.**
Booth 471

The makers of Baumanometer will exhibit various models of blood pressure apparatus, featuring the new Standby, a practical floor model. A complete line of genuine Latex replacement parts will also be displayed.

BECTON, DICKINSON & COMPANY
Booths 267, 268, 269

The making of hypodermic syringes and thermometers will be demonstrated, and visitors may see complete lines of syringes, needles, thermometers, aseptic syringes, Ace Bandages and diagnostic instruments. A new line of blood pressure instruments for the physician and hospital will be featured, with demonstrations and descriptions of new techniques in elastic adhesive therapy.

CAMBRIDGE INSTRUMENT COMPANY, INC.
Booth 311

A new Cambridge development will be shown this year. In addition to the full line of card, including the ble model for both office will exhibit a new portable instrument which automatically indicates and records blood pressure and provides a continuous record where desired.

CLAY-ADAMS COMPANY
Booth 484

Two main divisions spotlight this exhibit. First, anatomical models, OB manikins, charts, and skeletons, with a special muscle skeleton prepared by Clay-Adams, and the improved Ayers obstetrical manikin. Second, new developments in surgical, laboratory and clinical equipment, including the latest developments in Bilumen Gastro-Duodenal tubes for gastro-enterostomy and gastro-duodenal aspiration and a new counting device for differential blood counts.

FRÖBER-FAYBOR COMPANY
Booth 501

This exhibit will present the company's latest Model G Bio-photometer, embodying a new feature which eliminates the subjective character of the dark adaptation test. The use of the Bio-photometer as a clinical test for vitamin A deficiency will be demonstrated. New experimental instruments of interest to physicians will also be found here.

GASTRO-PHOTO LABORATORIES
Booth 457

This display will be of interest to physicians interested in complete and accurate diagnosis of gastric pathology. For the first time, the new automatic stomach camera for col development in ment, will be large number o gastrophotographs in natural color and black and white.

JONES METABOLISM EQUIPMENT CO.
Booth 177

In this exhibit you will see in operation the Jones Motor Basal metabolism unit. Representatives will explain the automatic correction of oxygen gas to standard volume at temperature regardless of barometer, the protractor for revealing technical errors and the Automatic Basal metabolism calculator.

LAMOTTE CHEMICAL PRODUCTS CO.
Booth 102

Among the new items which will be demonstrated at the LaMotte exhibit will be Blood Chemistry Units, Falling Drop Densimeter for determining blood proteins and specific gravity of body fluids, the outfit for determining both sugar and albumin in urine, and the Combination Unit for determining sulfathiazole, sulfapyridine and sulfanilamide in blood and urine. Physicians are cordially invited to call and inspect this equipment.

SANBORN COMPANY
Booth 498

Here you can see recent developments in modern, compact, apparatus for clinical electrocardiography. You are invited to discuss this equipment with representatives at the exhibit.

TAYLOR INSTRUMENT COMPANIES
Booth 274

The new Tycoos Hook Type Blood Pressure Cuff will be exhibited at the Taylor Instrument booth. This new cuff can be used with any type sphygmomanometer. Also on display will be the Pavax Glass Boot for the treatment of frost-bite, gangrene and other vascular diseases, and the Binoce fever thermometer.

AMERICAN CAN COMPANY
Booths 263 and 264

Registrants are cordially invited to visit these booths where information will be available concerning some aspects of commercially canned foods of interest to the medical profession. The American Can Company's modern, single-service, paper milk container will also be featured.

AMERICAN INSTITUTE OF BAKING
Booth 150

Facts about the new "Enriched Bread" will be available at the Institute's booth. This new white bread, enriched with vitamins and minerals natural to whole wheat, has been developed by American bakers and is considered a practical contribution to national defense and public health.

AMERICAN SEAL-KAP CORPORATION
Booth 465

Seal-Kap presents Enzy-lac, a fresh pasteurized milk of low curd tension and of remarkably easy digestibility. Step into the booth, and note that this milk is unchanged in taste, appearance, mineral content and caloric value. Learn how it solves the problem of milk digestibility for infants, premature and others.

BAKER LABORATORIES
Booth 439

Baker's complete line of infant foods, indicating some new trends in infant feeding, will be on display. These three will be included: Modified Milk, powder and liquid, a completely prepared milk in which composition has been so altered and adjusted as to closely simulate breast milk; Melcoose, a completely prepared milk; Melodex, maltose and dextrin, made for modifying milk.

BORCHERDT MALT EXTRACT COMPANY
Booth 134

Members of the staff will be present at the booth this year to greet their many personal friends and discuss new developments in the Borchardt line, including improvements in Malos, their product for infant feeding.

BORDEN COMPANY
Booths 209, 210, 211

A visit to the Borden Booths will acquaint you with Biolac, that popular liquid infant food designed to give the artificially fed baby both the nutritional and digestional advantages of the breast-fed. Also exhibited will be: Dryco, Beta Lactose, Klim, Merrel-Soule Products and Irradiated Evaporated Milks.

CARNATION COMPANY
Booth 483

In this exhibit you will see a quick, complete and dramatic presentation of the story of Carnation Milk. Every operation in the processing of Irradiated Carnation Milk—from farm to finished product—is performed right before your eyes. You will be interested in this personally conducted tour through a Carnation evaporating plant.

CEROPHYL LABORATORIES
Booth 441

The cereal grass product that attracted so much attention at previous meetings is being exhibited again this year. A cordial invitation is extended to visit the booth. Representatives will be glad to discuss the value of Cerophyl in special and therapeutic diets.

CITRUS CONCENTRATES, INC.
Booth 163

Refreshment has been prepared for visitors to the Citrus Concentrates booth. Sunfilled pure concentrated orange and grapefruit juices in ready-to-serve form will be offered by attendants.

HAROLD H. CLAPP, INC.
Booth 145

Clapp's new Cereal Food will be the subject of conversations with visiting physicians at the booth. This dry precooked infant cereal has just been introduced in many sections of the country and is probably news to a large number of attending doctors. There will also be several recently added strained and junior foods on display at the booth.

CORN PRODUCTS REFINING COMPANY
Booth 208

Make this exhibit a "must" on your itinerary. "Corn Products" has an effective display telling the vital facts about dextrose food-energy sugar and its place in the medical field.

DIETENE COMPANY
Booth 432

Here's your opportunity to have Dietene explained and to secure detailed analysis. Know why you can confidently recommend it as a dietary supplement. This special purpose low caloric food is said to take the counting out of calories. Plan to call at the Dietene booth.

FLORIDA CITRUS COMMISSION
Booth 122

This exhibit will feature both fresh and canned Florida citrus fruits. The Commission is a state body, functioning under state laws designed to regulate and promote the citrus industry for the benefit of consumers and growers.

GENERAL FOODS CORP.
Booths 222, 455, 456

Postum is being served at booths 455 and 456. This wholesome cereal beverage is made from whole wheat and bran, roasted and slightly sweetened. On display in two forms—Postum Cereal made like coffee and Instant Postum made instantly in the cup or pot. Postum-made-with-milk is an easy way to keep milk interesting. Pause for Postum! Delicious, economical, easy to prepare!

Stop at booth 222 and have a cup of delicious Sanka Coffee. This choice blend of Central and South American coffees has 97% of the caffeine removed.

GENERAL MILLS, INC.
Booth 442

A display featuring the manufacture of A.R.P.I. Process Vitamin D is an attraction at this booth. You will see how vitamin D is produced by activation of ergosterol with low velocity electrons. Other General Mills products will also be exhibited.

GERBER PRODUCTS COMPANY
Booth 297

The complete line of Gerber Baby Foods will be on display—dry pre-cooked cereal and fifteen strained foods. Booklets for distribution to mothers or patients on special diets, as well as professional literature, will be sent to registrants.

CHRIS HANSEN'S LABORATORY
Booth 253

Rennet-custards made with either "Junket" Rennet Powder, or "Junket" Rennet Tablets will be served at their booth by "The Junket" Folks." Besides the display of "Junket" Brand Food Products, the exhibit will feature enlarged photographs showing how the rennet enzyme in rennet-custards transforms milk into soft, fine curds. Fully informed attendants will be on duty.

HAWAIIAN PINEAPPLE COMPANY
Booth 413

Again this year chilled Dole Pineapple Juice from Hawaii will be served to Convention guests. This pure, unsweetened fruit juice and the canned fruit items of the Dole line will be found at the booth.

H. J. HEINZ COMPANY
Booths 275 and 276

The attractive presentation of Heinz Strained and Junior Foods merits your attention. Interesting new charts and photographs will tell the story of the contribution of these products to the welfare of American babies. You will want to visit the exhibit and register for a beautiful baby picture, suitable for framing, also the new edition of the Nutritional Charts and Nutritional Observatory.

IRRADIATED EVAPORATED MILK INSTITUTE
Booth 410

Some interesting facts about irradiated evaporated milk will be heard by visitors here. Representatives from the Institute office will discuss with you the many uses of irradiated evaporated milk in the dietary. Free publications and reports of clinical research by leading investigators will be on display for your inspection or use.

LEDERLE LABORATORIES, INC.

Booth 480

General practitioners will be interested in this exhibit of "Cerevim" recently acquired by Lederle. Literature and general information will be available through staff attendants and, to acquaint doctors with the appetizing flavor of "Cerevim," a uniformed nurse will invite them to sample it, complete with sugar and cream.

LIBBY, McNEILL & LIBBY

Booth 291

You are cordially invited to visit Libby, McNeill & Libby's exhibit, where attendants will point out the merits of homogenized baby foods, chopped foods and evaporated milk. Visitors will also hear why Libby's special method of homogenization makes their baby foods extra smooth, extra easy to digest.

M & R DIETETIC LABORATORIES

Booth 466

Similac, a completely modified milk specially prepared for infants deprived either partially or entirely of breast milk, will be featured by M & R Dietetic Laboratories, Inc. Competent representatives will be pleased to discuss the value of the zero curd tension of Similac as it applies to both normal and special feeding cases, or to answer any related questions.

MEAD JOHNSON & CO.

Booths 157, 158, 204, 443, 444, 493, 493A

A cordial welcome to the Mead Johnson exhibits this year will be reinforced by the interesting motion picture program to be shown in their space 493-A.

MELLIN'S FOOD COMPANY

Booths 400 and 401

Physicians are cordially invited to call and make inquiries regarding details of the composition and application of Mellin's Food. During the seventy-five years of its existence, Mellin's Food has established itself as worthy of consideration in attempts to arrange diets for infants, children, and, in certain cases, adults.

MULLER LABORATORIES

Booth 460

A display of the soy bean and some of its products has been arranged for you in this exhibit. The use of Mull-Soy in cases of milk allergy will be demonstrated, and representatives will be prepared to answer physicians' questions regarding this interesting product.

NATIONAL LIVE STOCK AND MEAT BOARD

Booth 494

Meat will be portrayed by this exhibit as a source of essential food elements—protein, fats, carbohydrate, calcium, phosphorus, iron, copper and six vitamins with special emphasis on vitamin B₁ (thiamine). The newly revised third edition Food Value Charts in colors, and booklets containing these charts will be available.

NESTLE'S MILK PRODUCTS, INC.

Booth 258

Lactogen will hold the center of the stage in the Nestlé exhibit. A cordial invitation is extended to all physicians to visit the booth.

PENICK AND FORD, LTD., INC.

Booth 123

The makers of Brer Rabbit Molasses invite your consideration of new findings on this rich and inexpensive source of iron. Results of chemical, biological and clinical research will be on exhibit at the booth. Significant is the conclusive demonstration of high availability (over 80%) of molasses-iron, which establishes New Orleans Molasses as second only to beef liver as a food source of absorbable iron.

S-M-A CORPORATION

Booth 260

The infant Food Division will display all products, including S-M-A Powder and Liquid, Hypo-Allergic Milk and Alerdex. New and useful literature on infant nutrition will be available. The Biochemical Division will show many of the recent developments in nutrition such as demonstrations of deficiency diseases in experimental animals. With various nutritional too, you of clinical results obtained in specific deficiency diseases in human subjects.

PET MILK CORPORATION

Booths 422, 423, 424, 425

This exhibit offers an opportunity to obtain information about the production of Irradiated Pet Milk and its uses in infant feeding and general dietary practice. You are invited to inspect the various interesting features of this display.

SCIENTIFIC SUGARS COMPANY

Booth 234

Here the maker will display Carlose, Hixid, and the line of Kinney's Yeast Extract preparations. Well informed representatives will be in attendance. All physicians are cordially invited to stop at the booth.

SUN-RAYED COMPANY

Booth 278

A special welcome awaits visitors to the Sun-Rayed booth. Demonstrators will offer samples of the natural, pasteurized juice of a new strain of Indiana tomatoes, sun-ripened on the vines and U. S. Government graded.

VEGEX, INCORPORATED

Booth 244

Featured in this exhibit will be the results of experimentation plus published reports of research, showing what Vegex contributes in raising the red blood cell count and hemoglobin percentage. Simple ways of serving Vegex will be demonstrated.

UNITED FRUIT COMPANY

Booth 257

The latest authentic information on the nutritive and therapeutic values of the banana will be available at this exhibit. The display will present some of the important clinical and nutritional studies which have been undertaken the past few years, and reports of these which have recently been published.

**AUREX CORPORATION**

Booth 514

Information about the eight standard instruments to compensate for the several prevalent types of deafness will be available to doctors at the Aurex exhibit. Representatives will also be glad to tell you about instruments especially designed for individual cases.

MAICO COMPANY, INC.

Booths 517 and 518

A free pocket flashlight suitable for medical work will be offered by the Maico Company to registering physicians. Against the unusual background of its "Tone Color Organ," on which all visitors can check their own hearing acuity for pitch and sensitivity, Maico will display its line of Council accepted audiometers, and new developments in tiny vacuum tube hearing aids. Other interesting electronic instruments on display will be "lie detectors," Psychometers and electro-stethoscopes.

OTARION, INC.

Booth 133

The merchandising plan of this manufacturer of fine hearing aids will be of interest to physicians and otologists. Full details of this new plan will be available at the Otation exhibit.

MEDICAL BOOKS**D. APPLETON-CENTURY**

Booth 437

Prominent in this display will be the following new titles: Blumer's four volume Therapeutics of Internal Diseases, Bancroft's Surgical Therapeutics, new supplementary volume of the Practitioners Library of Medicine and Surgery, Maingot's Abdominal Operations. These newly revised editions will appear: Stander's eighth edition, Williams' Obstetrics; Holt and McIntosh's eleventh edition, Diseases of Infancy and Childhood; Kolmer and Boerner's third edition, Approved Laboratory Technique; Yater's Fundamentals of Internal Medicine; Albee's Bone Graft Surgery; and Burstein's Illustrative Electrocardiography.

BLAKISTON COMPANY

Booth 309

This company will exhibit its complete line of medical texts and references. Among the new books and new editions will be: Jason, Hernia; Wolff, Anatomy of the Eye and Orbit; Halliburton & McDowell, Handbook of Physiology and Biochemistry, 36th edition; Strecker & Ebaugh, Practical Clinical Psychiatry, fifth edition; Robson, Recent Advances in Sex and Reproductive Physiology; Mennell, Physical Treatment by Movement, Manipulation and Massage, fourth edition; Iselin, Surgery of the Hand.

F. A. DAVIS COMPANY

Booth 259

You will probably want plenty of time to look over these publications: Stroud's Cardiovascular Disease, translated into Spanish and Portuguese; Loewenberg's Clinical Endocrinology; Goldberg's Clinical Tuberculosis; Lederer's Ear, Nose and Throat; Piersol's Cyclopedia of Medicine, Surgery and Specialties; Loewenberg's Medical Diagnosis and Symptomatology, fifth edition, revised and entirely rewritten; Reimann's Treatment in General Medicine, and its 1941 Progress Volume.

PAUL B. HOEBER, INC.

Booth 315

Some 200 medical titles will attract visitors to the Hoerber booths. New works to be seen there include Pardee's Electrocardiogram, new fourth edition; Mazer and Israel's Menstrual Disorders; Nielsen's Neurology; Harris's Brucellosis; Henry's Sex Variants; Weisman's Spermatozoa and Sterility; Margolis' Arthritis; Alvarez' Gastro-enterology, and many others.

LEA & FEBIGER

Booth 314

New works awaiting your examination here include Portis' Digestive Diseases, Kraines' Psychoses, Katz' Electrocardiography and Exercises, Lewin's Foot and Ankle, Ballenger's Manual, Rony on Obesity and Leanness, Packard Hayes and Blanchet on Artificial Pneumothorax and Adair's Obstetrics and Gynecology. New editions of many standard books will be shown, among them Joslin's Diabetes and Manual Helmer and Ruggles' Roentgenology, Haden's Contagious Diseases and Comroe's Arthritis.

J. B. LIPPINCOTT COMPANY
Booths 295 and 296

A number of new Lippincott books of interest to physicians will be displayed: Grollman's Essentials of Endocrinology and Tobias' Essentials of Dermatology, Leamr Cardiac Patient, Modern Surgical of Kracke's Diseases of the Blood and Atlas of Hematology, Goldthwait's Body Mechanics and other important titles will also be shown.

LITTLE, BROWN & COMPANY
Booth 129

The recently added Medical Book Department of Little, Brown will bring to their exhibit works by such men as Emil Novak, Jonathan Meakins, Soma Weiss, Davis Perla, Burton Hamilton, K. Jefferson Thomson, and E. Granville Crabtree.

MACMILLAN COMPANY
Booth 467

The center of interest at the Macmillan booth will be the much discussed Pharmacological Basis of Therapeutics, by Goodman and Gilman of Yale. Other books of interest: Essentials of Endocrinology, d IV; Miller's Schizophrenia in Childhood; Green's Mechanisms of Biological Oxidations; and Silverman's Magic in a Bottle—a true account of the discoveries and discoverers of ten of today's wonder-working drugs.

C. V. MOSBY COMPANY
Booth 205

Among the new medical and surgical literature which will tempt you to browse through this exhibit are the following titles, on display for the first time: Willius and Keys, Cardiac Classics; Crossen and Crossen, Foreign Bodies Left in the Abdomen; Harris, Clinical Pellagra; Nygaard, Hemorrhagic Diseases; and new editions of Meakins, Practice of Medicine; of Treatment on to Der Physical Diagnosis, and Titus, Obstetric Difficulties.

W. F. PRIOR COMPANY, INC.
Booth 300

The Prior Company will exhibit the new Waltman Walters-Lewis' Practice of Surgery, with 700 new pages. The publishers announce that during the next few months over sixty-five new chapters will be issued. A new loose-leaf index has also been prepared. The fortieth edition of Tice's Practice of Medicine will be displayed, with other standard reference volumes such as Brenemann's Practice of Pediatrics; Davis' Gynecology and Obstetrics and The Principles and Practice of Physical Therapy.

W. B. SAUNDERS COMPANY
Booths 307 and 313

Among the new books and new editions to be shown by these publishers are: Krusen's Physical Medicine; Ladd & Gross' Abdominal Surgery of Infancy and Childhood; the new 1911 Mayo Clinic Volume; Graybiel & White's Electrocardiography; Pelouze's Office Urology; 19th edition American Illustrated Medical Dictionary; third edition, Griffith & Mitchell's Pediatrics; Lewin's Acute Poliomyelitis; Steinbrocker's Arthritis; Kolmer & Tuft's Immunity, Biotherapy, and Chemotherapy; fifth edition, Cecil's Medicine; current series, Medical Clinics of North America and Surgical Clinics of North America.

OXFORD UNIVERSITY PRESS
Booth 201

Among the books on display will be the seventh edition of Applied Physiology by Dr. Samson Wright, which has been fully revised and enlarged. Also, the second edition of Diagnosis and Treatment of Diseases of the Heart by Dr. Henry A. Christian, as well as several standard Medical Monographs and Oxford Loose-Leaf Medicine.

SURGICAL PUBLISHING COMPANY
Booth 105

Convention visitors interested in surgery will enjoy the exhibit of this surgeons' journal, where pages are reproduced with special lighting to illuminate contents and bring out the fine typography and beautiful illustrations. An attendant will be present to point out unusual features of the journal, including the International Abstract of Surgery, which has been of special interest to subscribers.

UNIVERSITY OF CHICAGO PRESS
Booth 138

Recent medical publications of the following University Presses will be exhibited in this booth: Yale University Press, University of Minnesota Press, Harvard University Press, University of Chicago Press, Columbia University Press, Stanford University Press, Princeton University Press. Convention visitors are invited to examine important journals, reports of research and general publications in the field, on display here.

WILLIAMS & WILKINS COMPANY
Booth 317

With the century-old British connections of William Wood & Co., the Williams & Wilkins exhibit will be logical headquarters for "war books." These include Bailey, Surgery of Modern Warfare; Hurst, Medical Diseases of War; Fletcher, War Wounds and Injuries; Nicholls, Organization of British Army Medical Services. The widely read reprint of Bohler's Fractures, the new edition of Watson-Jones, Fractures, plus two hundred other current medical and surgical books will be available for examination.

YEAR BOOK PUBLISHERS, INC.
Booth 182

Timely volumes in the popular General Practice Manual group and three newly-added Year Book titles will be the center of interest in this publisher's exhibit. Also prominent in the display will be Fortieth Anniversary features of the Year Books. In addition, the publisher will show the line of moderate priced manuals and monographs issued by this house during the past four years.

OFFICE FURNITURE

W. D. ALLISON COMPANY
Booth 271

If you are interested in examining a line of fine wood medical furniture, this exhibit will merit a stopover on your tour.

DOMORE CHAIR COMPANY, INC.
Booth 426

Posture chairs for the executive and also for clerical and factory staffs will be displayed by the Domore Company. Of special

interest will be the Triple Duty Executive models, which provide for postural aid and relaxation, and lend themselves to an abdominal-diaphragmatic exercise while seated.

The "Postur-Matic" model, a new development to influence posture and promote evaporation of sweat, will also be shown.

HAMILTON MANUFACTURING CO.
Booths 106, 107, 108, 109

This display will feature three designs in modern medical furniture, ranging from budget Steeltone equipment to DeLuxe Nu-Tone furniture. All Hamilton walnut furniture displayed is equipped with the easy-running woodsteel drawer. Drawers and doors are silenced to lessen nerve strain. You are invited to inspect this equipment and see its time-saving features.

MCCASKEY REGISTER COMPANY
Booths 463 and 464

An exhibition of how steel brings the appearance of finest woods into the professional office will be found in the McCaskey booth. In addition to beauty of finish, this steel furniture offers the convenience of smooth ballbearing drawer action which requires but the touch of a finger. Metal visible files for active case records, installed in groups of twenty-five in a row, will also be demonstrated.

ROYAL METAL MANUFACTURING CO.
Booth 178

Several newly designed reception room chairs and settees will be on display here, also a new sterilizer cabinet and examination chair. An attractive feature of this year's Royal metal furniture will be the new upholstery shade called Cinnamon, a simulated rawhide.

SHAMPAINE COMPANY
Booths 172 and 173

The Shampaine display will consist of new models of Steelux physician's furniture, Martin all-purpose Chair Table, new Hydraulic Nose and Throat Specialist Chair, Lewis Hydraulic Treatment Chair Table and other samples of recent developments in steel surgical equipment.

AMERICAN OPTICAL COMPANY
Booths 446, 447, 448, 449, 450

A complete line of eye-diagnostic, eye-corrective and scientific instruments will be exhibited by American Optical Company and its scientific instrument division, Spencer Lens Company. Featured will be the recently developed Additive Phoropter, an instrument in which the three vital points of interest to users—prescription accuracy, ease of operation and patients' comfort—are combined. Spencer microscopes and projection equipment will also be shown.

BAUSCH & LOMB
Booths 469 and 470

Their medical, research and laboratory microscopes and accessories will be shown by Bausch & Lomb, also their varied line of diagnostic instruments, such as otoscopes, ophthalmoscopes, retinoscopes, and many others.

KEYSTONE VIEW COMPANY
Booth 497

Featured in the Keystone booth will be a new Cumulative Record Form for the DB tests which greatly simplifies their interpretation. You will also find a new split slide holder attachment for the Telebinocular and a similar attachment for the hand stereoscope, with wide application in administering base out and base in exercises. A new series of Synoptoscope slides in both opaque and transparency form supplements the regular line of orthoptic training material.

WELCH ALLYN COMPANY
Booth 155

The new Ophthalmoscope with filter system and slit aperture shown for the first time at the Convention in New York last year will be on exhibit again. Visiting

physicians are invited to inspect personally the new features embodied in this instrument. A full line of Welch Allyn diagnostic instruments will also be shown.

PHARMACEUTICALS AND BIOLOGICALS

ABBOTT LABORATORIES Booths 206 and 207

You are most heartily invited to visit this new, modern Abbott exhibit. Specially designed, this display will exemplify 20th century ingenuity, without that harshness of line and color so often present in modern design. Abbott-trained representatives in attendance will be glad to discuss the comprehensive selection of new products on display, including sulfapyridine, sulfathiazole, Liver Extract Injectable, and others.

AMERICAN HOSPITAL SUPPLY CORP. Booth 294

A cordial invitation is extended to physicians to examine the latest Baxter Laboratories' equipment for the preparation of human blood plasma and serum. There will be frequent demonstrations and discussions of this timely subject, and information on Baxter Intravenous Solutions and blood transfusion technique with the Transfuso-Vac, The Vasosclator or motorized oscillating bed for the treatment of peripheral vascular diseases will also be demonstrated.

ARLINGTON CHEMICAL COMPANY Booth 238

The Arlington Chemical Company invites visitors' inspection of their protein and pollen products for the diagnosis and hypsensitization of hay fever, asthma and other allergic conditions. The representative in charge of the exhibit will be happy to answer questions regarding the treatment of hay fever and asthma. Literature will be available.

ARMOUR LABORATORIES Booth 303

Capable and well-informed representatives will be on hand at this exhibit to welcome visitors and furnish information on endocrine products. New Index Cards on Armour endocrine products with an attractive metal case will be supplied to doctors registering at the booth.

BARRY ALLERGY LABORATORIES Booth 130

Physicians in the "hay fever belt" will be particularly interested in the allergy tests materials to be shown by Barry, also in the convenient patient report cards included with test equipment. Worth your while investigating.

BILHUBER-KNOLL CORPORATION Booth 233

Your visits to this booth will be welcome, and careful attention will be given questions and discussions on Dilaudid, Metrazol, Theocalcin, and other Council accepted medicinal chemicals. You may register for a copy of the Note Book of Medicinal Chemicals. A set of four colored charts, of the muscular, skeletal, circulatory, and respiratory systems, will also be supplied upon request.

CHURCH & DWIGHT CO., INC. Booth 239

Church & Dwight will exhibit Arm & Hammer Bicarbonate of Soda. Three years before the first meeting of the American Medical Association, this company pioneered in producing bicarbonate of soda in the Western Hemisphere. This year, besides exhibiting various uses of this product in medical practice, the attendants will demonstrate its value as a powder for cleaning the teeth.

GIBA PHARMACEUTICAL PRODUCTS Booths 126 and 127

Your call will be welcomed at the Giba booths, where well-known specialties will be on display. These will include Digifoline, Dial, Lipiodine, Nupercaine and Vioform. The Assistant Medical Director and other representatives of the firm will be present and will answer any questions in regard to the products displayed.

CUTTER LABORATORIES

Booth 435

Cutter Laboratories will feature their complete line of Council accepted biologicals and allied specialties. Among the latter, Sobisminol Mass for oral adjuvant syphilis therapy and their line of dextrose and other solutions in the special Saffi-flasks dispensing containers will be of particular interest.

DAVIES, ROSE & COMPANY, LTD.

Booth 462

Of particular interest to cardiologists and neurologists will be the preparations displayed by Davies, Rose & Company. You are invited to see this exhibit and discuss the products with company representatives.

DRUG PRODUCTS CO., INC.

Booth 431

You will find this professional house of Hyposols and Pulvoids exhibiting Pulvoids Digitalis Forum, a mode of digitalis therapy biologically standardized by the Hatcher-Brody cat method, Pulvoids Sulfanilamide, Hyposols Sodium Cacodylate and other injectable solutions, Council accepted. Those in attendance will be pleased to explain the Pulvoids method of manufacture.

ENDO PRODUCTS, INC.

Booth 416

You will want to see this interesting exhibit of Council accepted ampoules in the making. Skilled hands and up-to-date machinery from the laboratories will combine to demonstrate the intricate steps which go into the filling and sealing of drugs in ampoules. Representatives will explain the process and discuss the products with you.

FLINT, EATON & COMPANY

Booth 147

An attractive exhibit has been arranged, featuring Calcium-Gluconate-Effervescer, Flint, a new and palatable dosage form of calcium gluconate. Physicians interested in calcium therapy are cordially invited to visit the booth.

GRADWOHL LABORATORIES

Booth 461

This exhibit will show advantages of staining blood films with Giemsa stain, also methods of rapid frozen section work of tissues. Information on the use of plasma as a substitute for whole blood will be available.

HOFFMANN-LA ROCHE, INC.

Booth 277

War shortages of atropine and belladonna have greatly increased physicians' interest in Syntropan. This antispasmodic will be one of the featured drugs in the Hoffmann-La Roche exhibit. Prostigmin preparations will likewise be an attraction and members of the Roche Medical Division will be in attendance for discussion of pharmaceutical prescription specialties from Roche Park.

HOSPITAL LIQUIDS, INC.

Booth 270

Many doctors will be interested in this exhibit of the new methods of handling and administering fluids intravenously. Apparatus and illustrations will be shown, and qualified technicians will discuss the problems in this field.

HYNISON, WESTCOTT & DUNNING, INC.

Booth 219

An exhibit featuring Mercurochrome and specialties will be also be a display and ampule solution firm's laboratories. Competent representatives will demonstrate the products, and literature and samples will be available.

INTERNATIONAL VITAMIN CORPORATION

Booths 433 and 434

This "House of Vitamins" will feature at its booth the production of its highly potent vitamin A and D Oils. The I.V.C. Council accepted products will also be displayed, and the Director of Research will be available for consultation.

LAKESIDE LABORATORIES, INC.

Booth 468

Lakeside's exhibit will illustrate the intensive control and research procedures which are essential in manufacturing products for the medical profession. Progress in these fields is especially important in the preparation of ampule medications.

LEDERLE LABORATORIES, INC.

Booths 252, 265, 266

Products for dealing with pernicious anemia, pneumonia and vitamin B deficiencies will be exhibited in four sections. Liver therapy in pernicious anemia will be illustrated by charts and photomicrographic material showing neurological involvement in pernicious anemia. Color transparency charts and photomicrographs will illustrate the drop in pneumonia mortality since the general acceptance by the profession of type specific serum and Sulfonamide therapy.

ELI LILLY AND COMPANY

Booths 202, 203, 217, 218

The Lilly Laboratories have centered their exhibit this year around an interesting demonstration of the "mouse convulsion" method of testing the potency of Nelin, Insulin, Lilly. Other important Council accepted products will be featured, and members of the medical staff will be in attendance.

McKESSON & ROBBINS

Booth 243

A display of vitamin products with a correlated exhibit on vitamins will be presented by McKesson & Robbins. Physicians are cordially invited to see the recent developments in this field.

McNEIL LABORATORIES, INC.

Booth 429

Physicians are invited to call and discuss recent developments in the pharmaceutical field with members of the staff of McNeil Laboratories. The exhibition will feature Digitalis Duo-test and the technique used in its double-testing by the U. S. P. frog method and the Reed-Vanderkleed guinea pig method. Other displayed for in- for samples or ned.

MALLINGKRODT CHEMICAL WORKS

Booth 298

Doctors and their friends are invited to visit the Mallinckrodt display of U. S. P. and N. F. preparations which are most frequently used and prescribed by physicians.

cians. Specialties offered to the medical profession by this firm will also be exhibited. The attendants in charge will be glad to be of service in answering questions.

MALTINE COMPANY
Booth 246

The Maltine display will illustrate the materials and methods used in producing this company's well-known Maltine with Cod Liver Oil. Trained representatives will be glad to explain the modern methods of producing these Council accepted products, which have been undergoing improvements during the past sixty-five years: Maltine with Cod Liver Oil, Maltine with Cod Liver Oil and Iron Iodide, and Maltine Plain.

MERCK & COMPANY
Booths 236 and 237

New and vitally important advances in medicine will highlight the Merck exhibit. The vitamins, amino acids, and sulfonamides will be presented together with the inhalation anesthetic, Vinethene. A special panel will be devoted to important Merck prescription chemicals.

WM. S. MERRELL COMPANY
Booth 436

This exhibit will feature the newer specific agents in the fields of nutrition and chemotherapy, also a number of original research products of interest to physicians. You are most cordially invited to visit the Merrell booth.

NATIONAL DRUG COMPANY
Booth 149

Rhus Tox Antigen and Hay Fever Pollen Antigens will be prominently featured in the exhibit. A complete line of Council accepted National biologicals will be displayed. A competent staff of salesmen and research workers will be in attendance to discuss with visiting doctors, nurses and hospital officials the various National biological, biochemical and pharmaceutical products.

OHIO CHEMICAL & MANUFACTURING CO.
Booths 116 and 117

See the complete line of Heidbrink Kinometer Gas Machines, resuscitation equipment, oxygen tents, Oropharyngeal Outfits and other types of therapy equipment adapted for hospital use. You will also see a full display of Ohio equipment and anesthetic gases.

PARKE, DAVIS & COMPANY
Booths 272, 285, 286, 299

Featured in the Parke-Davis exhibit will be the sex hormone preparations, Theloin and Theolol . . . anti-syphilitic agents, such as Mapharsin and Thio-Bismol . . . posterior lobe preparations, including Pituitrin, Pitocin and Pitressin . . . and various Adrenalin Chloride preparations.

E. L. PATCH COMPANY
Booth 482

The growing seriousness of the cod liver oil situation will lend interest to this exhibit. Representatives will be in attendance and ready to give you information concerning Patch's Cod Liver Oil and the ever-changing vitamin picture. You are cordially invited to visit the booth.

PETROLAGAR LABORATORIES, INC.
Booth 261

Physicians are cordially invited to visit here and request copies of the new series of colored illustrations of the gastro-intes-

tinal tract. Representatives will be present to explain and demonstrate new and unusual features of Petrolagar emulsion of mineral oil.

RIEDEL-de HAEN, INC.
Booth 318

The result of recent studies of the effect of Decholin and Decholin sodium on increasing the arterial blood supply of the liver will be displayed here. Attending representatives will be glad to discuss the therapeutic implication of this action of Decholin in the treatment of hepatic and biliary tract disorders.

SANDOZ CHEMICAL WORKS, INC.
Booth 254

Physicians will be interested in Gynergen, ergotamine tartrate, employed for the relief of migraine as well as for dependable uterine hemostasis. Sandoz' pure cardioactive glycosidal products to be displayed include Digilanid, the crystallized initial lanata, standardize as biological will as well as biological. Also featured will be the gluconate preparations of calcium, Calglucon, and Sandoptal, an efficient hypnotic.

SCHERING CORPORATION
Booth 310

Two products will be emphasized in the Schering exhibit: Thyroid U. S. P. and Neo-Iopax. Schering's Thyroid U. S. P. exemplifies precision standardization on a chemical basis. Neo-Iopax is a safe intravenous urographic medium for visualization of the urinary tract, uterus and tubes, the great vessels, and other regions.

G. D. SEARLE & COMPANY
Booths 220 and 221

Research activities will be emphasized in this year's exhibit. Several members of the research staff will be present, in addition to the usual complement of sales department representatives, both anxious to discuss with members of the medical profession any question with respect to Searle research products.

SHARP & DOHME
Booths 226 and 227

You will find this display featuring Propadrine Hydrochloride and other items in both the pharmaceutical and biological fields. Physicians are invited to visit the booths, where competent representatives will be in attendance.

SMITH-DORSEY COMPANY
Booth 175

Physicians are cordially invited to visit the Smith-Dorsey booth, where they will find on display chocolate flavored Emulsion Liquid Petroleum and other Council accepted products. Representatives in charge of the exhibit will be glad to furnish full information about products shown.

E. R. SQUIBB & SONS
Booths 280, 281, 282

Constructed of gleaming white tile and brilliantly lighted, this exhibit will display pictures and charts pertaining to recent studies in the fields of nutrition, endocrinology, biological therapy and chemotherapy. In this manner, Squibb will show some of the intensely interesting work being conducted in its Research Laboratories. Representatives will be on hand to welcome you and furnish any information desired.

SMITH, KLINE & FRENCH LABORATORIES
Booth 223

One hundred years of service to the medical profession will be commemorated by this firm's exhibit. Council accepted specialties will be on display and trained representatives, as well as members of the Research Department, will be on hand to answer questions.

FREDERICK STEARNS & COMPANY
Booths 100 and 101

Professional representatives at the Stearns booth will have information for visitors on the use of such products as Neo-Synephrin Hydrochloride for intranasal use and Sterile Solution for parenteral use in acute hypotension and spinal anesthesia. Information will also be available on Appella Apple Powder-Stearns for use in infantile diarrheas and dysenteries, Gastric Mucin-Stearns for use in treatment of peptic ulcer and Liver Extract U. S. P., Oral and Subcutaneous for treatment of pernicious anemia.

WALLACE & TIERNAN PRODUCTS, INC.
Booth 152

Members of the Pharmaceutical Division staff will be on hand to greet you, and discuss the Council accepted product Azochloramid employed in the prevention and control of wound infection.

WHITE LABORATORIES, INC.
Booth 301

An exposition of the typical deficiency manifestations of two accessory food factors has been prepared for the Convention by the Research Staff of the Laboratories. Qualified representatives will demonstrate the special features of the exhibit and present the experimental and clinical background of White's Council accepted vitamin preparations.

WINTHROP CHEMICAL COMPANY
Booths 306 and 308

A display specially prepared for the Convention will greet visitors at the Winthrop booth. You are invited to see this up-to-the-minute exhibit.

WISCONSIN ALUMNI RESEARCH FOUNDATION
Booth 476

An attractive exhibit demonstrating not only the need for important functions the Wisconsin Alumni. Members of will be glad to provide physicians with authoritative information regarding Vials, bottled Vitar, dairies, and MILK.

JOHN WYETH & BROTHER, INC.
Booths 159 and 458

Complete information and literature on Silver Picrate as used in genito-urinary and gynecological practice will be available through Wyeth representatives in attendance at the exhibit. You are invited to investigate this product.

BECK-LEE CORPORATION
Booth 428

Achieved—an x-ray unit which promises to make the advantages of radiography and fluoroscopy easily available to physicians in general practice. This is the Beck-Lee BLX 10, which will be spotlighted in the exhibit along with the Beck-Lee Quartz-string Electrocardiograph.

BEDFORD SURGICAL COMPANY
Booths 141, 142, 143

The Bedford Company will present an advance showing of the new line of Continental products—featuring x-ray, fluoroscope, Council accepted Short wave diathermy apparatus, and the 1912 suites of medical office equipment.

BIRTCHEER CORPORATION
Booth 176

Conspicuous in this year's Birtcheer display will be their new Electrosurgical Unit—a combination tube and spark-gap machine for trans-urethral prostatic resection, brain surgery, and all types of major and minor work. Physicians owning short-

wave equipment and electrosurgical devices will also be interested in the many and varied Birtcher electrodes and accessories designed to make this apparatus more useful.

BURDICK CORPORATION

Booth 283

The Burdick Corporation will show their complete line of physical therapy equipment, including short wave diathermy, ultraviolet and infra-red lamps, electro-surgical and low voltage units. Features of special interest will be the Rhythmic Constrictor for the treatment of peripheral vascular diseases, and the Vibrocardiograph, a new cathode ray instrument for visualizing and recording all heart vibrations.

CANADIAN RADIUM & URANIUM CORP.

Booth 151

A visit to this absorbing exhibit will remind medical men that all needs for radium in the Western Hemisphere can now be supplied wholly within this hemisphere. This situation follows the successful development of the rich reserves of ore at Great Bear Lake in the Canadian sub-Arctic, and the completion of large modern refining facilities at Port Hope, Ontario. As sole sales agent for the output, the exhibitors offer this high-purity radium in any form and any type of container. For further interesting details, call at the booth.

WARREN E. COLLINS, INC.

Booth 316

A new development to increase the usefulness of the famous Drinker-Collins Respirator will be shown this year. Be sure to see this interesting new feature, also the new "streamlined" model of the Drinker-Collins Infant Respirator and Incubator for resuscitating the newborn, the Benedict-Roth Metabolism apparatus, and the Collins Oxyflo "Open-Top" oxygen tent.

E & J MANUFACTURING CO.

Booth 454

Latest improvements in ease of operation make the E & J Resuscitator well worth a visit of inspection. Movement of just one lever makes Aspirator, Resuscitator or Inhalator immediately available in the one device. See this appliance on display.

H. G. FISCHER & COMPANY

Booth 290

Inviting visitors to "look under the hood" of Fischer apparatus, the makers will display their shockproof x-ray apparatus, short wave units, ultraviolet and other generators.

GENERAL ELECTRIC X-RAY CORPORATION

Booths 247, 248, 249, 250

Included in this exhibit will be therapeutic x-ray apparatus, diagnostic x-ray apparatus, physio-therapy apparatus, supplies and accessories. Among these will be a new model photo-roentgen unit improved from crank to lens to permit finer detail over the entire chest area and to make operation smoother and speedier. This unit photographs the fluoroscopic image of the chest on a 4 by 5 inch celluloid film, large enough for direct diagnosis.

HANOVIA CHEMICAL & MFG. COMPANY

Booth 241

A new local therapy ultraviolet quartz lamp cooled by air instead of water will be on view in the Hanovia booth, and attendants will welcome requests for demonstrations. A complete line of self-lighting ultraviolet quartz lamps will also be on display, as well as Sollux radiant heat lamps, short and ultra-short wave apparatus.

LEPEL HIGH FREQUENCY LABORATORIES

Booths 153 and 154

In this exhibit you will find Lepel's spark gap short wave generators, tube short wave generators and the induction type mercury quartz ultraviolet lamps, two models of which are made for operation from high frequency generators and are Council accepted. A demonstration of the apparatus and lamps will be given.

KELLEY-KOETT MFG. CO., INC.

Booths 168, 169, 170, 171

At the Kelley-Koett display physicians will see a most complete line of modern x-ray equipment from the smallest portable units to complete diagnostic combinations. Feel free to discuss your interests and inspect all the models.

LIEBEL-FLARSHEIM COMPANY

Booth 427

The complete line of L-F Short and Ultra-Short Wave Generators, and the famous Bowie Electro-Surgical Units will be on display for visitors. In addition, the Hypertherm all air-conditioned Fever Cabinet, ultraviolet equipment and other newly developed and interesting physical therapy apparatus and accessories will be shown. You will find the attendants pleased to demonstrate this modern equipment.

McINTOSH ELECTRICAL CORPORATION

Booth 136

Old McIntosh customers and friends will receive a cordial welcome at the booth. The latest models of Hogen Brevatherm short wave diathermy apparatus, sinusoidal and galvanic current equipment and the Biolite and Infra-Red Lamps will be displayed. An expert from the factory will be present to answer any questions on physical therapy technique.

McKESSON APPLIANCE COMPANY

Booth 148

Helpful information concerning the oxygen therapy equipment, metabolism apparatus and other McKesson Appliances will be available at their booth. Well-informed representatives will be on hand to discuss the machines and their uses.

MATTERN MANUFACTURING CO.

Booths 279, 292, 293

Units to be exhibited by the Mattern Company this year include: Roentgen Special 200 MA 140 P.K.V., MX 200-100 with DeLuxe Push Button Panel Control, 60 MA 90 PKV Therapy Mobile Unit, and 15 MA 73 PKV Combination Mobile and Portable Unit. You are invited to inspect this apparatus.

PHILIPS METALIX CORPORATION

Booth 492

Visitors to this exhibit will have the opportunity to inspect and have demonstrated the Philips modern X-Ray Generators incorporating the Philips automatized circuit which adds to the life of the x-ray tube and assures consistent radiographic results. Radiographic and fluoroscopic tilt tables will be shown, also Philips x-ray tubes.

PICKER X-RAY CORPORATION

Booths 228, 229, 230, 232

A complete line of modern shockproof x-ray apparatus will be shown, including the Comet unit, Century unit, Series 200 unit for fluoroscopy and radiography, and 200,000 volt deep therapy equipment. Also, the United States Army Mobile Field X-Ray unit will be displayed, complete with special packing chests. This unit, designed in cooperation with the Army Medical Division, will probably be of great interest to visiting doctors.

PURITAN COMPRESSED GAS CORPORATION

Booth 164

You are cordially invited to visit the exhibit of "Puritan Maid" gases and a complete line of gas equipment. Of particular interest are the Puritan Mask and Bag, and two-stage pressure regulator, which have

been found to be widely adaptable for use in inhalation gas therapy. Visitors may obtain a copy of Gas Therapy Equipment Catalog No. 28.

RADIUM CHEMICAL COMPANY, INC.

Booth 479

The latest instruments for the handling and application of radium and radon will be exhibited. Representatives will be pleased to discuss with physicians their radium and radon requirements and to outline the company's leasing service, whereby physicians may have continuous possession of radium at a nominal monthly fee with no capital investment; also the plan for purchase of radium.

RADIUM EMANATION CORPORATION

Booth 179

Visit this exhibit and see a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leak-proof Radon Seeds. The advantages of these seeds will be demonstrated.

E. J. ROSE MFG. COMPANY

Booth 104

Newest developments in short wave diathermy, low voltage wave generators, electro-surgical equipment, and the genuine Cold Quartz ultraviolet lamps will be on display here. As in past years, the exhibit will be conducted for educational purposes. Competent factory representatives will be on hand to answer questions, conduct demonstrations and assist in any way desired.

STANDARD X-RAY COMPANY

Booths 419 and 420

X-ray apparatus of the latest design will be shown by this exhibitor. Attendants will be glad to demonstrate the Model EBRF Unit, designed primarily for office installation, permitting all types of fluoroscopic and radiographic work, and offered at a moderate price. X-ray apparatus for other requirements will also be exhibited.

WESTINGHOUSE X-RAY DIVISION

Booths 403, 404, 405, 406

The United States Army x-ray field table will occupy a prominent place in the Westinghouse exhibit. This table is designed for the localization of foreign bodies and also for practical radiographic and fluoroscopic procedures in Army hospitals. Another interesting exhibit will be photo-fluorographic equipment designed for rapid and economical mass surveys of chests. Other interesting x-ray equipment will also be featured in this exhibit.

S. H. CAMP & COMPANY

Booth 321

A life-sized reproduction of the Camp Transparent Woman will be displayed as the central theme of a typical service department equipped to serve patients with the various supports prescribed by physicians. The complete line of merchandise for prenatal, postnatal, orthopedic, visceroptosis, sacro-iliac, hernial and other specific conditions will be shown. Experts from the Camp staff will be in attendance to answer questions.

MARCH 25—MORNING

THE COURT:—I might say to the jury that Mr. Leahy is sick today; he will get out tomorrow. Counsel is going on with some matters meanwhile.

TESTIMONY OF J. FRANCIS MOORE DIRECT EXAMINATION

By Mr. Burke:

J. Francis Moore said he had brought some documents of the Federal Home Loan Bank Board which were subpoenaed.

THE BY-LAWS OF GROUP HEALTH ASSOCIATION

Mr. Richardson then read the entire by-laws of Group Health Assn., Inc. beginning with "Article III. This dealt with Membership Meetings and was amended May 25, 1937.

Sections 2 and 3 also dealt with meetings and had been amended May 25, 1937.

Sections 4 and 5 dealt with election of the Board of Trustees. Section 6 dealt with the right to vote and had been amended in May 1937 and in May 1938.

Section 7 described a quorum.

"Article IV dealt with the duties of the Trustees.

Article V described the Officers.

"Section 5. The Board of Trustees shall employ a competent, qualified Doctor of Medicine as the Medical Director, and such assistants, orderlies, nurses or other help necessary to the proper functioning of the corporation."

Section 5 of Article V was amended on May 2, 1938, to read as follows:

"Section 5. The Board of Trustees shall contract for and in behalf of the members of this corporation, with physicians duly licensed to practice their profession in the District of Columbia, who shall render such service to the members as may be provided in said contract. One of said physicians shall be designated as the Medical Director, who, with the approval of the Trustees, may engage the services of such assistants, orderlies, nurses, or other help, in order to properly render the services contracted for."

Article V was amended on May 25, 1937, to include the following:

"Section 6. The Medical Director shall render such reports as the Board of Trustees shall require."

Section 6 of Article V was amended, on May 2, 1938, to read as follows:

"Section 6. The Board of Trustees shall in no way regulate or supervise the practice of medicine by any physician with whom it contracts for the care of members nor shall it in any way supervise, regulate or interfere with the usual professional relationship between such physician and his patient member, and every such contract entered into by and between a physician and the corporation shall contain a positive covenant to that effect."

"Article VI dealt with Finance.

"Article VII.

"Dues.

Section 1:

"The dues for membership in this corporation shall be Three Dollars and Thirty Cents (\$3.30) per month for married persons or single persons having dependents, and Two Dollars and Twenty Cents (\$2.20) per month for single persons having no dependents, and shall be paid in advance semi-monthly. Where permitted, the corporation shall be given the right to require deduction for its use and benefit from the employee's wages due him from any of the federal branches or agencies by which he or she is employed the amount of his current dues together with any payment for back dues owed to the corporation.

That section was amended on April 6, 1937, to read as follows:

"Section 1. There shall be two classes of membership, i.e., (1) family membership; and (2) individual membership. Family membership shall include married or single members with dependents as hereinafter defined and the dues for membership of such class shall be \$3.30 per month. Individual membership shall include married or single members having no declared dependents, and the dues for membership of such class shall be \$2.20 per month."

Section 1 of Article VII was amended on Sept. 19, 1938, to read as follows:

"Section 1. A member may have services procured for himself alone or for himself and any or all of his eligible dependents. A dependent is a member's spouse or a person related by blood, marriage or adoption to the member and who is supported by and lives with that member. A child dependent is a dependent who has not attained the age of 21.

"(a) Whenever a person ceases to qualify as a dependent of a member no further services shall be procured with respect to such person after the expiration of the month following the month in which he becomes disqualified.

"(b) Services shall be procured for and dues paid with respect to a child born to such member (unless previous notice to the contrary has been given the Association in writing by the member). For purposes of determining dues a child or other dependent shall remain a dependent so long as he remains eligible, until written notice to the contrary is received from the member. Any increase in dues shall be effective the first day of the month following the month in which such child is born, attains age 18 or attains age 21, as the case may be. In the event of death of a dependent or notice that such dependent is no longer to have service, the reduction in a member's dues shall be effective on the first day of the succeeding month. In the case of the death of a member or upon his written notice to the Association of his resignation, all dues shall cease on the first day of the month succeeding such death or the effective date of such notice of resignation, and after the first of such month no further services shall be procured for the member's dependents.

"(c) In case notice of withdrawal of a person from membership or withdrawal of a dependent is received in the office of the Association later than the tenth day of the month, the membership dues and the services shall cease or be decreased on the first day of the second month succeeding that in which such notice is received. It shall be the duty of every member to give written notice to the Association of any fact that would change the rate of dues or other monies payable by him.

"(d) Whenever a member desires to have services procured for any dependent (except a newborn baby) who was not on Sept. 1, 1938 listed as a dependent in connection with his membership, he shall make application, tender \$1.00 for application fee and, unless such dependent is rejected because of physical condition, such member shall thereupon be entitled to have services procured for such dependent. Such services shall be procured on and after, and the dues shall be increased on, the first day of the month succeeding the date of physical examination.

"(e) Whenever any dependent desires and is eligible to become a member, such person may apply for membership, and such application shall be given preferred consideration. Medical examination in such cases and in other cases where circumstances are unusual, may be waived for such person and/or his dependents at the option of the Board of Trustees."

Section 1 (d) of Article VII was amended, on Oct. 3, 1938, to read as follows:

"Section 1 (d). Whenever a member desires to have services procured for any dependent (except a newborn baby) who was not on Sept. 1, 1938 listed by him as a dependent in connection with his membership, he shall make application, tender \$1.00 for application fee and, unless such dependent is rejected because of physical condition, such member shall thereupon be entitled to have services procured for such dependent. Such services shall be procured on and after, and the dues shall be increased on, the first day of the month succeeding the date of physical examination."

Section 1 (b) of Article VII was amended on Nov. 21, 1938 to read as follows:

"Section 1 (b). Services shall be procured for and dues paid with respect to a child born to such member (unless previous notice to the contrary has been given the Association in writing by the member). For purposes of determining dues a child or other dependent shall remain a dependent so long as he remains eligible, until written notice to the con-

trary is received from the member. Any increase in dues shall be effective the first day of the month following the month in which such child is born, attains age 18 or attains age 21, as the case may be. In the event of death of a dependent or notice, received prior to the 10th of the month, that such dependent is no longer to have service, the reduction in a member's dues shall be effective on the first day of the succeeding month. In the case of the death of a member or upon his written notice to the Association of his resignation, received prior to the 10th of the month, all dues shall cease on the first day of the month succeeding such death or the receipt of such notice of resignation, and after the first of such month no further services shall be produced for the member's dependents"

"Section 2:

"Members who join the corporation hereafter shall, for the first month, be charged dues for a full month if their application for membership is dated between the 1st and 15th of the month, and shall be charged dues for one-half month if their application is dated between the 16th and last day of the month."

Section 2 of Article VII was amended on Sept. 19, 1938 to read as follows:

"Section 2.

"(a) All members shall be required to pay a membership fee of \$10 which shall be paid for at the rate of not less than \$1.00 per month. The first installment shall be paid not later than the due date of the member's first monthly dues following the adoption of this amendment.

"(b) Upon full payment of the membership fee a suitable certificate shall be issued to the member.

"(c) Such certificate may be transferred, upon the payment of a transfer fee in such amount as is fixed by Board regulations, to any person who is accepted as a member, provided that the person whose certificate is transferred is a person not indebted to the Association and is a member in good standing who (1) has been a member two years, or (2) who has become disqualified from membership because of severance from Government service or (3) who removes from the territory served by the Association. The transferee of a membership certificate shall by virtue of such transfer be entitled to a credit of \$10 toward his membership fee. On death of a member his certificate shall be non-transferable and shall be null and void. Whenever a member is no longer employed by the executive branch of the Federal Government, or moves from the area served by the Group Health Association, at the sole discretion of the Trustees, such person may be repaid his \$10 membership fee or any portion he has paid the Corporation.

"(d) Proceeds of membership fees shall, in so far as possible, be used only for purchase and maintenance of equipment and other property."

Article VII was amended on Sept. 19, 1938, to include the following:

"Section 3.

"(a) After Aug. 1, 1938, any person desiring to become a member shall make payment of an application fee of \$5, plus \$1 for each dependent with respect to whom he desires to have services secured and shall fill out an application on a prescribed blank or blanks. If, after review of application and medical examination of all the persons on whose behalf services are requested, the application is not accepted, this fee shall be returned, unless the person applying is otherwise eligible for membership and desires to become a member under conditions stated in the next subsection.

"(b) In the case of applications not otherwise generally acceptable by reason of the physical condition of the member or a dependent, the Association, upon the recommendation of the Medical Director, may make special membership arrangements with such applicant with respect to the services to be procured for him by the Association."

Article VII was amended, on Sept. 19, 1938, to include the following:

"Section 4. After Aug. 1, 1938 every member who desires to procure services for a dependent not listed as such shall make application on a prescribed form and pay a \$1 application fee, which shall in no case be returned. If, after review of the application and medical examination of such dependent, the dependent is not generally acceptable by reason of physical condition, the Association upon the recommendation of the Medical Director may make special membership arrangements."

Article VII was amended, on Sept. 19, 1938, to include the following:

"Section 5. Membership dues shall for September 1938 and thereafter be payable the first of each month and shall be as follows:

Single member or head of family.....	\$2.20
Husband or wife.....	1.80
Child dependents under 18 (one or more).....	1.00
Child dependents, 18 to 21 (each).....	1.00
Adult dependents over 21 (each).....	2.00

New memberships shall become effective and dues payable on the first day of the month following acceptance of the person for membership or upon the 16th day of the same month if the Board so directs."

Article VII was amended, on Sept. 19, 1938, to include the following:

"Section 6. Any indebtedness of a member to the Association shall be added to and considered a part of the dues for the month succeeding that in which the indebtedness was incurred provided, however, that the Board of Trustees in its discretion may permit the payment of any indebtedness to be made in installments or forgive a portion or all of said indebtedness when the Trustees find that in equity and good conscience such action shall be taken. In the case of indebtedness other than for the monthly dues, the member shall be promptly notified of the amount of the indebtedness"

Article VII was amended, on Sept. 19, 1938, to include the following:

"Section 7. Except by amendment of these By-laws, no fees, dues or assessments of any kind not herein provided, shall be required of any member of the Association."

ARTICLE VIII

RESIGNATIONS

"Section 1. Any member of this corporation may withdraw therefrom by resignation and shall owe in such case dues for only thirty (30) days from the date of his or her resignation, he or she to have the privileges of membership during said thirty (30) day period. (As adopted March 22, 1937.)"

Section 1 of Article VIII was amended on May 25, 1937, to read as follows:

"Section 1. Any member of this corporation may withdraw therefrom by resignation and shall owe in such case dues for only thirty (30) days from the date of his or her resignation, he or she to have the privileges of membership during said thirty (30) day period, provided, however, that the member may withdraw his resignation in writing within the said period."

Article VIII was repealed on Sept. 19, 1938.

Article IX dealt with Amendments.

ARTICLE X

BENEFITS

"Section 1. To be able to avail themselves of medical and surgical service, the members must be located in, or its closely and adjacent territory, or must come to, the City of Washington, D. C. (As adopted March 22, 1937.)"

Section 1 of Article X was amended, on April 6, 1937, to read as follows:

"Section 1. The medical service to be rendered to members and dependents by the corporation shall be as follows:

"Medical and surgical examinations and treatments, including examinations in special departments, such as refractions of eyes; laboratory tests, X-ray examinations, surgical operations, confinement cases and professional consultations, nursing and ambulance facilities, house calls, and hospitalization in a semi-private room (two bed room) limited to a period not to exceed 21 days for any one illness. However, members desiring to occupy a private room may do so in which case the corporation will contribute the sum of \$4.00 per day toward the expense of such room for such period. In all hospital cases, the corporation will pay for semi-private room (two bed room) service only, except in the case of infectious or contagious diseases, in which case a maximum of \$4.00 per day will be paid for said period.

"The extent that medical service relating to the foregoing items will be furnished to members shall be determined and prescribed by the Medical Director or his representatives in each individual case."

Section 1 of Article X was amended, on May 25, 1937, by adding "not exceeding 21 days" to the second paragraph.

Section 1 of Article X was amended, on Oct. 25, 1937, to read as follows:

"ARTICLE X, Section 1. The medical service to be rendered to members and dependents by the corporation shall be as follows:

"Medical and surgical examinations and treatments, including examinations in special departments, such as refractions of eyes, laboratory tests, x-ray examinations, surgical operations, confinement cases and professional consultations, nursing and ambulance facilities, house calls, and hospitalization in a semi-private room (two-bed room) or a private room, limited in either case to a period not to exceed 21 days for any one illness; provided, however, that each member desiring to occupy a private room shall reimburse the corporation for so much of the cost of such room as shall exceed the sum of \$4.00 per day; provided, further, that such member shall make such payments to assure such reimbursement as the corporation shall require, and provided, that the benefits provided outside of the territory of the association shall be limited to the provision of a hospital room for the time and as is herein provided.

"The extent that medical service relating to the foregoing items will be furnished to members shall be determined and prescribed by the Medical Director or his representatives in each individual case."

Section 1 of Article X was amended, on May 2, 1938, to read as follows:

"Section 1. The contract or contracts to be made by his corporation on behalf of the members thereof with physicians, as provided in Section 5 of Article V, or with others, shall provide for the following services to members:

"Medical and surgical examinations and treatments, including examinations in special departments, such as refractions of eyes, laboratory tests, x-ray examinations, surgical operations, confinement cases, and professional consultations, nursing and ambulance facilities, house calls, and hospitalization in a semi-private room (two-bed room) or a private room, limited in either case to a period not to exceed 21 days for any one illness; provided, however, that each member desiring to occupy a private room or a semi-private room of his own choice shall pay so much of the cost of such room as shall exceed the sum of \$4.00 per day; provided, further, that such member shall make such advance payments to assure the aforesaid reimbursement as the Trustees shall require; and provided, further, that the benefits provided outside of the territory of the association shall be limited to the provision of a hospital room for the time and as is herein provided.

"Members or dependents in order to avail themselves of medical and surgical service shall come to the doctor's office if such is possible from the nature of their illness. Doctors will answer necessary house calls within a radius of ten miles from the District of Columbia line, except that the Medical Director may provide for house calls not exceeding twenty miles. Members will furnish such doctor with any information he may request relative to their condition and membership and should, at all times, have available their membership card for identification.

"The extent that medical service relating to the foregoing items will be furnished to members shall be determined and prescribed by the Medical Director or his representatives in each individual case."

Section 1 of Article X was amended, on Sept. 19, 1938, to read as follows:

"Section 1. The contract or contracts to be made by this corporation on behalf of the members thereof with physicians, as provided in these by-laws, or with others, shall provide for the following services:

"Medical and surgical examinations and treatments, including examinations in special departments, such as refractions of eyes, laboratory tests, x-ray examinations, surgical operations, confinement cases, and professional consultations, nursing and ambulance facilities, house calls and hospitalization in a semi-private room (two-bed room) or a private room, limited in either case to a period not to exceed 21 days for any one illness or accident and not to exceed a total of 42 days for any member or dependent during any one calendar year; provided, however, that when a member desires a private room or a semi-private room of his own choice for himself or his dependent he shall pay so much of the cost as shall exceed the sum of \$4.00 per day; provided, further, that each member shall make such advance payments or other arrangements to assure the said payment as the Trustees shall require; and provided, further, that the services procured outside of the territory of the Association shall be limited to the provision of hospital facilities for the time and as is herein provided.

"No hospitalization, and no service except that given under such contract or contracts shall be procured for any member or dependent, save upon prior written authorization by the Medical Director; Provided, that in cases of emergency, subsequent ratification by the Medical Director shall have the same effect as prior authorization; provided, however, that the Medical Director may not ratify any services save hospitalization procured outside of the service area.

"Any hospitalization procured shall be limited in time to the date of the patient's discharge or such shorter time as the Medical Director may deem proper.

"Hospitalization shall be construed to mean: (a) bed and board in a hospital, (b) general nursing care, (c) use of the operating room or delivery room when necessary, (d) services of an anesthetist, (e) ordinary surgical dressings, (f) ordinary medications, and (g) routine laboratory examinations; except, that where hospitalization is procured outside the service area or without prior authorization by the Medical Director, no more than \$15 may be allowed for the use of the operating or delivery room and no more than \$10 may be allowed for the services of an anesthetist.

"Members or dependents, in order to avail themselves of medical and surgical service, shall report to the clinic if such is possible from the nature of their illness. Doctors will answer necessary house calls within ten miles from the District of Columbia line, as provided in this article, and the Medical Director may provide for house calls not exceeding twenty miles. Members will furnish such doctor with any information he may request relative to their condition and membership and should, at all times, have available their membership cards for identification.

"The extent that medical service relating to the foregoing items will be furnished shall be determined and prescribed by the Medical Director or his representative in each individual case.

"Section 2. Any person referred to herein as a dependent, to be eligible to the benefits of the corporation, must be totally dependent upon the member of the corporation for a livelihood at the time of such person's disability and before need of medical service. However, under this provision persons who are working and receiving compensation for their services are not dependent, with the exception of wife or husband, or school children who work during the summer months only, may be considered dependent. Any member who accepts medical attention from a corporation doctor, or who has medical services performed for any person who he claims is dependent upon him and who is found not to be entitled to such medical service, shall reimburse the corporation for any payment the corporation may have made on his account, and, further, shall pay the corporation for the services of the doctor who attended the case, or the corporation may cause the same to be deducted from the wages due such employee as provided in Section 1 of Article VI of these by-laws. (As adopted March 22, 1937.)"

Section 2 of Article X was amended, on April 6, 1937, to read as follows:

"Section 2. The following medical service will not be furnished by the corporation:

- (1) Treatment of industrial accident cases;
- (2) Surgery of the brain or nervous system;
- (3) Mental cases, tuberculosis, drug or alcohol addiction; these cases will be treated only up to the time that the Medical Director recommends confinement in an institution."

Section 2 of Article X was amended, on May 25, 1937, to read as follows:

"Section 2. The following medical service will not be furnished by the corporation:

- (1) Treatment of industrial accident cases;
- (2) Surgery of the brain or nervous system;
- (3) After the time that the Medical Director recommends confinement in an institution in mental, tubercular, drug or alcohol addiction cases."

Section 2 of Article X was amended, on May 2, 1938, to read as follows:

"Section 2. The contract or contracts to be made by this corporation on behalf of the members, with physicians, as provided in Section 5 of Article V of these By-Laws, or with others, shall not provide for the following services to members:

- (1) Treatment of industrial accident cases;
- (2) Surgery of the brain or nervous system;
- (3) Any treatment after the time that the Medical Director recommends commitment to an institution in mental, tubercular, drug or alcohol addiction cases."

Section 2 of Article X was amended, on Sept. 19, 1938, to read as follows:

"Section 2. The contract or contracts to be made by this Association on behalf of the members, with physicians, as provided in these By-laws, or with others, shall not provide for the following services:

- (1) Treatment of industrial accident cases where treatment is provided under Federal or State Employees Compensation Laws to the extent of such provision;
- (2) Surgery of the brain or nervous system;
- (3) Any treatment after the time that the Medical Director recommends commitment to or hospitalization in an institution in mental, tubercular, drug, or alcohol addiction cases.

"Section 3. In all hospital cases, the corporation will pay for semi-private room, except in the case of infectious or contagious disease, in which case a maximum of Five (\$5.00) Dollars per day will be paid. (As adopted March 22, 1937.)"

Section 3 of Article X was amended, on April 6, 1937, to read as follows:

"Section 3. The members shall pay for the following items:

- (1) Medicines, drugs, surgical appliances such as orthopedic devices and crutches; eye glasses, artificial limbs or eyes and hearing devices;
- (2) Radium and deep x-ray treatments;
- (3) Dental work;
- (4) Oxygen tanks or tents and materials;
- (5) Blood transfusions;
- (6) Special nursing service if not ordered by the Medical Director;
- (7) Treatment, services, supplies and other items prescribed or ordered by an "outside doctor" including his fees.
- (8) Treatment of venereal diseases at the rate of Fifty Cents (\$0.50) per treatment.
- (9) Hospitalization in excess of that mentioned above.

The corporation shall make an effort to secure at reduced rates all the medical services and items for which the member is required to pay."

Section 3 of Article X was amended, on May 2, 1938, to read as follows:

"Section 3. Any contract entered into by the corporation on behalf of its members will require the members to pay for the following:

- (1) Medicines, drugs, surgical appliances, such as orthopedic devices and crutches; eye glasses; artificial limbs or eyes; and hearing devices;
- (2) Radium and deep x-ray treatments;
- (3) Dental work;
- (4) Oxygen tanks or tents and materials;
- (5) Blood transfusions;
- (6) Special nursing service if not ordered by the Medical Director;
- (7) Treatment, services, supplies and other items prescribed or ordered by a physician not in a contractual relationship with the corporation and its member, but employed by an individual member, including fees of such physician.
- (8) Treatment of venereal diseases at the rate of Fifty Cents (50c) per treatment.
- (9) Hospitalization in excess of that mentioned in Section 1 of this article.

The corporation shall make an effort to secure at reduced rates all the medical services and items for which the member is required to pay."

Section 3 of Article X was amended, on Sept. 19, 1938, to read as follows:

"Section 3. Any contract entered into by the Association on behalf of its members will require the members to pay for the following:

- (1) Medicine, drugs, surgical appliances, such as orthopedic devices and crutches; eye glasses; artificial limbs or eyes; and hearing devices;
- (2) Radium and deep x-ray treatments;
- (3) Dental work and dental x-rays;
- (4) Oxygen tanks or tents and materials;
- (5) Blood transfusions;
- (6) Special nursing service if not ordered by the Medical Director;
- (7) Treatment, services, supplies and other items prescribed or ordered by a physician not in a contractual relationship with the Association and its members, but employed by an individual member, including fees of such physicians;
- (8) Hospitalization in excess of that mentioned in Section 1 of this article, provided, however that in confinement cases the member shall in every case bear the first \$25 of hospitalization expense;
- (9) For each house call the member shall reimburse the association for travel expense of the physician in an amount not exceeding \$1.00; provided that no charge shall be made for travel expense for additional house calls after the first, made at the instance of the attending physician.

"Section 4. No member of this corporation or any of his or her dependents shall request the corporation doctor to call at his or her residence if such person is able to call at the doctor's office. Doctors will answer necessary house calls within a radius of ten miles from the District line. Members will, upon request of the corporation doctor, furnish such doctor with any information he may request relative to their eligibility to benefits from the corporation and should, at all times, have available their card for identification. (As adopted March 22, 1937.)"

Section 4 of Article X was amended, on April 6, 1937, to read as follows:

"Section 4. The corporation will not assume responsibility for furnishing unlimited medical service to members but will do so only to the extent of its resources and to the extent which, in each case, is considered desirable and necessary by the Medical Director."

Section 4 of Article X was amended, on May 25, 1937, to read as follows:

"Section 4. The corporation will not assume responsibility for furnishing unlimited medical service to members but will do so only to the extent of its resources."

Section 4 of Article X was amended, on Oct. 4, 1937 to read as follows:

"ARTICLE X, Section 4. The corporation does not provide insurance for its members but only undertakes to provide medical and hospitalization service for them as herein stated, and in any event will furnish such service only to the extent of its resources."

Section 4 of Article X was amended, on Oct. 25, 1937, to read as follows:

"ARTICLE X, Section 4. The corporation does not provide insurance for its members but only undertakes to provide medical and hospitalization service for them as herein stated, and in any event will furnish such service only to the extent of its resources."

Section 4 of Article X was amended, on May 2, 1938, to read as follows:

"Section 4 (a). The corporation does not guarantee that it will provide any or all of the services above specified and for which it will attempt to contract on behalf of its members and it shall not be liable to any member or his dependent in any manner whatever if it should for any reason, including lack of funds, be unable to procure any or all of said services when called upon to do so.

(b) The corporation does not guarantee that any physician or physicians with whom it may enter into a contract to render services to its members will perform such contract and its only obligation in the event of the breach of such contract by any physician shall be to use its best effort to procure the needed services from another source.

(c) The corporation shall not be liable to its members or their dependents for any act of omission or commission on the part of physicians or other persons with whom it may contract for the rendition of services to its members and their dependents."

Section 4 of Article X was amended, on Sept. 19, 1938, to read as follows:

"Section 4 (a). The Association does not guarantee that it will provide any or all of the services above specified and for which it will attempt to contract on behalf of its members and it shall not be liable to any member or his dependent in any manner whatever if it should for any reason, including lack of funds, be unable to procure any or all of said services when called upon to do so.

(b) The Association does not guarantee that any physician or physicians with whom it may enter into a contract to render services will perform or properly perform such contract, and its only obligation in the event of the breach of such contract by any physician shall be to use its best efforts to procure the needed services from another source.

(c) The Association shall not be liable to its members or their dependents for any act of omission or commission on the part of physicians or other persons with whom it may contract for the rendition of services to its members and their dependents.

"Section 5. Any member of the corporation who incurs hospital expense on account of himself or a dependent previously listed with the corporation, as a result of sickness or accident while absent from the territory served by the corporation, shall be reimbursed, upon certification of the physician in attendance, all or any part of such expense, but no amount will be paid in any case in excess of what would have been paid had the service occurred in the territory served by the corporation. Whenever any sickness or injury shall be caused to the member, or his dependent, by the tort of a third person and that person should pay for the medical or other expenses growing out of said injury, this corporation shall be subrogated to and be entitled to reimbursement for the medical or other services furnished and for which said member has collected from said third person. (As adopted March 22, 1937.)"

Section 5 of Article X was amended, on April 6, 1937, to read as follows:

"Section 5. The Trustees shall have the right to determine and modify the extent of the service to be furnished to members at any time they may decide to do so upon written notice to the members to that effect given fifteen (15) days prior to any such change."

Section 5 of Article X was amended, on Sept. 19, 1938 to read as follows:

"Section 5. The Trustees shall have the right to determine and modify the extent of the service to be furnished to members at any time they may decide to do so upon written notice to the members to that effect given fifteen (15) days prior to any such change."

Article X, on April 6, 1937, was amended to include the following:

"Section 6. To be able to avail themselves of medical and surgical service, the members or dependents must be located in, or within ten miles of the District of Columbia line, or must come to, the City of Washington, D. C."

Section 6 of Article X was amended, on May 25, 1937, to read as follows:

"Section 6. To be able to avail themselves of medical and surgical service, the members or dependents must be located in, or within ten miles of the District of Columbia line, or must come to, the City of Washington, D. C., except that the Medical Director may provide for house calls not exceeding twenty miles."

By amendment on Oct. 25, 1937, Section 6 of Article X was deleted.

Article X, on April 6, 1937, was amended to include the following:

"Section 7. Any person referred to herein as a dependent, to be eligible to the benefits of the corporation, must be totally dependent upon the member of the corporation for a livelihood at the time of such person's disability and before need of medical service. However, under this provision persons who are regularly working and receiving compensation for their services are not dependent, with the exception of wife or husband, or school children who work during the summer months only, may be considered dependent. Any member who accepts medical attention from the corporation doctor, or who has medical services performed for any person who he claims is dependent upon him and who is found not to be entitled to such medical service, shall reimburse the corporation for any payment the corporation may have made on his account, and, further, shall pay the corporation for the services of the doctor who attended the case, or the corporation may cause the same to be deducted from the wages due such employee as provided in Section 1 of Article VI of these by-laws."

Section 7 of Article X was amended, on May 25, 1937, to read as follows:

"Section 7. Any person referred to herein as a dependent, to be eligible to the benefits of the corporation, must be totally dependent upon the member of the corporation for a livelihood at the time of such person's disability and before need of medical service. However, under this provision persons who are regularly working and receiving compensation for their services are not dependent, with the exception of wife or husband, or school children who work during the summer months only, may be considered dependent. Any member who accepts medical attention from the corporation doctor, to which he is not entitled, or who has medical services performed for any person not entitled thereto shall reimburse the corporation for any payment the corporation may have made on his account, and, further, shall pay the corporation for the services of the doctor who attended the case, or the corporation may cause the same to be deducted from the wages due such employee."

Section 7 of Article X was amended, on Oct. 25, 1937, to read as follows:

"ARTICLE X, Section 7. Any person referred to herein as a dependent, to be eligible to the benefits of the corporation, must be totally dependent upon the member of the corporation for a livelihood at the time of such person's disability and before need of medical service. However, under this provision persons who are regularly working and receiving compensation for their services are not dependent, with the exception that wife or husband, or school children who work during the summer months only, may be considered dependent. Any member who accepts medical attention from the corporation doctor, to which he is not entitled, or who has medical services performed for any person not entitled thereto, shall reimburse the corporation for the cost, or, at the option of the corporation, the reasonable value, of any services rendered by the corporation on his account, and, further, shall pay the corporation for the services of the doctor who attended the case, or the corporation may cause the same to be deducted from the wages due such employee. (This section becomes Section 6 by amendment of Oct. 25, 1937)"

Section 6 of Article X was amended, on May 2, 1938, to read as follows:

"Section 6. Any person referred to herein as a dependent, to be eligible to the benefits of the corporation, must be totally dependent upon a member of the corporation for a livelihood prior to and at the time of such person's disability and prior to and at the time of need of medical service. Under this provision persons who are regularly working and receiving compensation for their services are not dependent, with the exception that wife or husband, or school children who work during the summer months only, may be considered dependent. Any member who accepts benefits hereunder to which he is not entitled, or who secures such benefits for any person not entitled thereto, shall pay a penalty commensurate with the value of the services so received as may be determined by the Board of Trustees."

Article X on April 6, 1937 was amended to include the following:

"Section 8. No member of this corporation or any of his or her dependents shall request the corporation doctor to call at his or her residence if such person is able to call at the doctor's office. Doctors will answer necessary house calls within a radius of ten miles from the District of Columbia line. Members will, upon request of the corporation doctor, furnish such doctor with any information he may request relative to their condition and eligibility to benefits from the corporation and should, at all times, have available their associate or membership card for identification."

Section 8 of Article X was amended on May 25, 1937 to read as follows:

"Section 8. Members or dependents in order to avail themselves of medical and surgical service shall come to the doctor's office if such is possible from the nature of their illness. Doctors will answer necessary house calls within a radius of ten miles from the District of Columbia

line, except that the Medical Director may provide for house calls not exceeding twenty miles. Members will, upon request of the corporation doctor, furnish such doctor with any information he may request relative to their condition and eligibility to benefits from the corporation and should, at all times, have available their associate or membership card for identification."

Section 8 of Article X was amended on Oct. 25, 1937 to read as follows:

"ARTICLE X, Section 8. Members or dependents in order to avail themselves of medical and surgical service shall come to the doctor's office if such is possible from the nature of their illness. Doctors will answer necessary house calls within a radius of ten miles from the District of Columbia line, except that the Medical Director may provide for house calls not exceeding twenty miles. Members will, upon request of the corporation doctor, furnish such doctor with any information he may request relative to their condition and eligibility to benefits from the corporation and should, at all times, have available their associate or membership card for identification."

(This section becomes Section 7 by amendment of Oct. 25, 1937.)

Section 7 of Article X was repealed on May 2, 1938.

Article X, on April 6, 1937, was amended to include the following:

"Section 9. Any member of the corporation who incurs hospital expense on account of himself or a dependent previously listed with the corporation, as a result of illness falling within the by-laws and rules of the corporation, or accident while absent from the territory served by the corporation, shall be reimbursed, upon satisfactory certification or evidence thereof by the attending physician approved by the Medical Director of this corporation, all or any part of such expense, but no amount will be paid in any case in excess of what would have been paid had the illness or accident occurred in the territory served by the corporation."

Whenever any illness or injury shall be caused to the member or his dependent by the tort of a third person and that person should pay for the medical or other expense growing out of said injury, this corporation shall be subrogated to and be entitled to reimbursement for the medical or other services furnished by it and for which said member has collected from said third person."

Section 9 of Article X was amended, on May 25, 1937, to read as follows:

"Section 9. Any member of the corporation while temporarily absent from the territory served by the corporation, who incurs hospital expense on account of himself or a dependent previously listed with the corporation, as a result of illness or accident falling within the by-laws and rules of the corporation, shall be reimbursed, upon satisfactory certification or evidence thereof by the attending physician approved by the Medical Director of this corporation, all or any part of such expense, but no amount will be paid in any case in excess of what would have been paid had the illness or accident occurred in the territory served by the corporation. Whenever any illness or injury shall be caused to the member or his dependent by the tort of a third person and that person should pay for the medical or other expense growing out of said injury, this corporation shall be subrogated to and be entitled to reimbursement for the medical or other services furnished by it for which said member has collected from said third person."

Section 9 of Article X was deleted by amendment of Oct. 25, 1937.

(Here occurred extended discussion to the Court as whether or not a statement by Dr. John H. Trinder at a meeting Oct. 25, 1937 would be read.)

[Because of the material for the annual meeting of the Association in this issue, the amount of space devoted to the trial necessarily is limited. The proceedings of the trial will be completed in the next few issues.—Ed.]

OFFICIAL NOTES

RADIO BROADCASTS

"Doctors At Work" is the title of the sixth annual series of dramatized radio programs being presented by the American Medical Association and the National Broadcasting Company. The series began on November 13 and will close with a broadcast from Cleveland on June 4.

Tickets are available for each broadcast. Address the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Tickets are free, but a stamped self-addressed envelop should accompany requests.

The next three programs to be broadcast, together with their dates and titles, are as follows:

- April 30. Baby's Birthright.
- May 7. So Mothers May Live.
- May 14. Physician to the Community.

The program is scheduled over the Blue network of the National Broadcasting Company Wednesdays at 10:30 p. m. eastern daylight saving (9:30 eastern standard) time (9:30 Chicago daylight saving, 8:30 central standard, 7:30 mountain standard, 6:30 Pacific standard time).

WOMAN'S AUXILIARY

California

The Fresno auxiliary recently completed highly successful Hygia and New Membership drives. Drs. A. E. Anderson and George H. Kress were guests of honor at a recent meeting at which Dr. Kress urged the group to pay strict heed to the impending medical legislation. Mr. Donald Wonder, director of the endocrine department at the Cutter Laboratory at Berkeley, described the work of the laboratory.

Mrs. A. E. Anderson, state president, reminded the San Diego members that the Basic Science Law would come up soon and that it would be necessary to have 200,000 signatures to the petition. The medical societies are asking the auxiliaries to assist in securing these signatures. The Benevolence Committee provided a year's supply of tooth powder, wash cloths and dusting powder for the Vauclain Home, which is a tuberculosis ward for the children of San Diego County. In addition, all the children were supplied with two gifts each. Mrs. Willard Newman gave a monologue entitled "A Doctor's Wife at the Telephone," which was a delightfully amusing view of what goes on in a doctor's home two hours before a formal dinner party.

Georgia

The Woman's Auxiliary to the Medical Society of the Third District met recently in Columbus. Officers for the coming year are: district manager, Mrs. C. P. Savage, Montezuma; district manager-elect, Mrs. J. L. Gallemore, Perry, and secretary-treasurer, Mrs. Francis Blackmar, Columbus.

State officers present were Mrs. H. G. Banister, of Ila, who spoke on "Mobilizing for Service to Humanity"; Mrs. Lee Howard, of Savannah, president-elect, who spoke on "Organization," and Mrs. G. L. Loden, of Colbert, chairman of health films, who asked that each county auxiliary sponsor at least two films. Mrs. Banister announced that she is offering \$5 for the best visual report of the year's work. Dr. J. C. Patterson, of Cuthbert, president of the Medical Association of Georgia, gave a paper on "Progress in the Practice of Medicine Since 1865." After adjournment, tea was served by members of the Muscogee County auxiliary and later the guests were entertained by the doctors at a banquet.

Mrs. Eustace A. Allen, of Atlanta, past president of the Woman's Auxiliary to the Medical Association of Georgia and third vice president of the national group, spoke on "Socialized Medicine" at the first regular meeting of the Woman's Auxiliary to the Cobb County Medical Society. The meeting was held at the home of the president, Mrs. W. H. Perkinson, in Marietta.

Wisconsin

Thirty-eight members of the Dane County auxiliary heard Mr. J. G. Crownhart, secretary of the State Medical Society of Wisconsin, give a résumé of the aims of the medical profession regarding the centennial convention to be held in Madison in 1941. The auxiliary placed *Hygia* in four town libraries and in forty-eight schools in the county and purchased twenty layettes, rubber sheeting and Christmas toys for distribution by the county nurse. Mrs. C. N. Neupert of Madison is president of this auxiliary.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status.—The Senate Committee on Military Affairs has tabled S. 783, the Murray bill, providing for the deferment of selection of medical students, interns and certain others for active service under the Selective Training and Service Act. H. R. 2475 has been passed by the House, with amendments, proposing to prohibit prostitution within such reasonable distance of military and naval establishments as the Secretaries of War and Navy shall determine to be needful to the efficiency, health and welfare of the Army and Navy.

Bill Introduced.—H. R. 4418, introduced by Representative Faddis, Pennsylvania, undertakes to amend the Selective Training and Service Act of 1940 by providing that any man selected for training and service under the act who has been awarded a degree of doctor of medicine or doctor of dental surgery by a recognized medical or dental school, who holds a valid license to practice medicine, surgery or dentistry in any state, territory or possession of the United States or the District of Columbia and is engaged in such practice at the time of his selection and whose physical and mental fitness for such training and service has been satisfactorily determined shall, in lieu of induction for such training and service, be commissioned as an officer in the Medical Department Reserve, Officers' Reserve Corps and ordered into active military service as provided by law. This bill also provides that medical and dental students at recognized medical and dental schools, and interns and resident physicians, surgeons and dentists at recognized hospitals, shall be exempt from training and service but not registration under the act. The bill further provides that any such medical or dental student, intern or resident physician, surgeon or dentist who is a member of a reserve component of the land or naval forces of the United States shall not be ordered or called to active duty or into active service in any of such forces without his consent, except in time of war. This bill is identical with the Murray bill as introduced in the Seventy-Sixth Congress and reintroduced in the Seventy-Seventh Congress as S. 197.

STATE MEDICAL LEGISLATION

Connecticut

Bill Passed.—Substitute for S. 1031 passed the Senate, April 15, proposing so to amend the law requiring an action based on the alleged malpractice of a physician, surgeon, dentist, hospital or sanatorium to be instituted within one year from the date of the act of malpractice complained of as to impose the same time requirement with respect to the institution of actions based on the alleged malpractice of a chiropractor.

Florida

Bill Introduced.—H. 87 proposes to enact an entirely new naturopathic practice act which, if enacted, would permit naturopathic licentiates to practice without restriction other than the performance of major surgery. Significantly, the bill refers to naturopathy as "naturopathic medicine," to naturopaths as "naturopathic physicians" and to the board of naturopathic examiners, created by the bill, as the board of "naturopathic medical examiners."

Massachusetts

Bill Introduced.—S. 636 proposes to require the state to furnish recipients of old age assistance "hospital and medical services and expenses of medicine and medical care."

South Carolina

Bill Introduced.—H. 462 proposes to make it unlawful for any school of medicine in the state, receiving or partially supported by appropriations from the state, to adopt any rule or faculty requirement relating to the admission, readmission or promotion of students which does not apply with equal force and effect and without discrimination to all students.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Heart Association Meeting.—The California Heart Association will hold its annual meeting at Del Monte, May 4. A symposium on digitalis lanata will open the session, with the following speakers: Drs. Maurice Sokolow, Francis L. Chamberlain and Francis J. Rochex, San Francisco. Among other speakers will be Drs. William D. Evans, Los Angeles, on "The Electrocardiographic Pattern of Left Ventricular Strain (Barnes); Clinical and Pathologic Study"; John K. Lewis, San Francisco, "Auricular Flutter with Special Reference to Its Treatment with Digitalis," and Lester S. Lipsitch, San Francisco, "Certain Aspects of Carotid Sinus Sensitivity."

Annual Meeting of California Medical Association.—The seventieth annual session of the California Medical Association will be held at the Hotel Del Monte, Del Monte, May 5-8, under the presidency of Dr. Harry H. Wilson, Los Angeles, and with the Monterey County Medical Society acting as host. Out of state speakers will include:

Dr. William Warner Watkins, Phoenix, Ariz., Facts and Fancies in Lower Back Disability.

Dr. Robert F. Loeb, New York, Problems of Adrenal Insufficiency.

Dr. Waltman Walters, Rochester, Minn., Surgery of Adrenal Tumors.

Dr. John H. Hutton, Portland, Ore., Use of Avertin Nitrous Oxide Anesthesia in Thoracic Surgery.

Dr. John H. Musser, New Orleans, Role of the Medical Profession in the Defense Industrial Program.

Mr. John M. Pratt, Chicago, Report on National Physicians' Committee for the Extension of Medical Service.

A symposium on military medicine will be held Thursday morning. There will also be symposiums on blood disorders, the sulfanilamide group of drugs, anoxia and histopathology of the more common skin lesions. Panel discussions will be held on intestinal obstruction and problems in the care of the aged, and a round table discussion of hormones producing tumors of the ovary. Medical, surgical and public health films will be shown in the Copper Cup Room during the morning hours and, unless otherwise announced, a different film will start on each half hour, commencing at 9 o'clock and continuing up to the noon hour. The annual clinical session on cancer will be devoted this year to "Cancer of the Lung." Miscellaneous activities include a conference in microscopic pathology, a radiologic meeting, the conference of secretaries of component county medical societies, annual meeting of the California Heart Association, the session of the Western Association of Industrial Physicians and Surgeons, and the exhibition of the California Physicians' Art Association. The Woman's Auxiliary to the California Medical Association will hold its twelfth annual meeting at this time, with headquarters at the Hotel Del Monte and sessions at the Peninsula Country Club.

CONNECTICUT

Changes in Health Officers.—Dr. Roy C. Ferguson, Rockville, has been appointed health officer of Vernon, succeeding Dr. Thomas F. O'Loughlin, Rockville. Dr. Irwin Grammiss, Saybrook, has been made health officer of the borough of Fenwick, Old Saybrook. Dr. Edward J. Finn has been appointed health officer of Shelton, succeeding Dr. Charles K. Skreczko Jr. Dr. Morton H. Chapnick, Putnam, is serving as health officer of Thompson during the absence of Dr. Joseph L. Roy; the latter will return on Jan. 8, 1942.

Nursing Institutes on Poliomyelitis.—The Connecticut State Department of Health sponsored nursing institutes on poliomyelitis in Bridgeport April 14, Hartford April 15 and Norwich April 16. The preliminary program listed the following speakers:

Drs. James D. Trask, New Haven, and Eugene E. Lamoureux, Hartford, Epidemiologic and Medical Aspects of Poliomyelitis.

Dr. Paul P. Swett, Bloomfield, Orthopedic Aspects of Poliomyelitis. Katherine Allen, R.N., New York, Nursing Care in Poliomyelitis (with demonstrations) and The Nurse and Physical Therapy.

Dr. Muriel A. C. Downer, New Haven, Principles of Physical Therapy in the Treatment of Poliomyelitis.

FLORIDA

State Medical Meeting.—The sixty-eighth annual meeting of the Florida Medical Association will be held at the Roosevelt Hotel, Jacksonville, April 28-30, under the presidency of Dr. John Samuel Turberville, Century. Among the speakers will be:

- Dr. Elmo D. French, Miami, Sporotrichosis.
- Dr. Hillard W. Willis, Coral Gables, Congenital Cystic Lung Disease in Infancy (report of a case).
- Dr. Carlos A. P. Lamar, Miami, Application of the Synthetic Sex Hormones, Male and Female, in Their Newer Forms.
- Dr. Charles J. Heinberg, Pensacola, Preventiculousis.
- Dr. Richard M. Fleming, Miami, Surgical Treatment of Extensive or Advanced Cancers of the Skin.
- Dr. Abraham R. Hollender, Miami Beach, Fallacious Views Concerning Rhinologic Surgery and Factors Influencing More Successful Results.
- Dr. Louie M. Limbaugh, Jacksonville, Use of Quinidine Sulfate in the Treatment of Auricular Fibrillation.

Dr. Seale Harris, professor emeritus of medicine, University of Alabama School of Medicine, University, will address a general session Tuesday morning on "Hyperinsulinism: Induced and Spontaneous Hypoglycemia." The program also includes a symposium on obstetrics by Drs. Robert G. Nelson, Tampa; James M. Hoffman, Pensacola, and Samuel R. Norris, Jacksonville. The stag smoker will be Monday evening at the George Washington Hotel and the annual banquet Tuesday evening. The past presidents' breakfast will be held Tuesday. Specialty group meetings will include the Florida Railway Surgeons' Association, Florida Pediatric Society, Florida section of the American College of Physicians, Florida Society of Dermatology and Syphilology, Florida Society of Ophthalmology and Otolaryngology, Florida Association of Industrial Surgeons, health officers' section of the Florida Public Health Association, Florida Society of Obstetrics and Gynecology and the Florida section of the American College of Surgeons.

ILLINOIS

The Women's Field Army.—The Women's Field Army of the American Society for the Control of Cancer during April is conducting its sixth annual enrolment campaign. This organization, launched in 1936, now has in forty-seven states about four thousand six hundred local units and fifty-four divisions which seek to form educational and enlistment units in every community and county. The medical aspects of the work of the Women's Field Army for the Control of Cancer in Illinois are supervised by an advisory committee of the Illinois State Medical Society, of which Dr. John A. Wolfer, Chicago, is chairman. The Illinois commander of the Women's Field Army is Mrs. Arthur I. Edison, Chicago, who is also vice president of the Woman's Auxiliary to the Illinois State Medical Society. The Illinois headquarters of the Women's Field Army are at 48 West Division Street, Chicago. Telephone Whitehall 7838.

Bowen's Conviction Set Aside.—The Illinois Supreme Court set aside the conviction of A. L. Bowen, former state director of public welfare, on charges of omission of duty in failing to safeguard the water supply at Manteno State Hospital at Manteno, the Chicago *Tribune* reported, April 16. Sixty persons died of typhoid in the hospital in 1939. Bowen was convicted of neglect of duty, ordered removed from office and fined \$1,000 by Judge James V. Bartley of Joliet in the Kankakee County circuit court last June. The supreme court ruled that the state failed to prove Bowen guilty and said: "It was not proved, and we cannot assume, that typhoid bacillus ever was found in the drinking water." Bowen's defense was that the epidemic was not caused by contaminated drinking water but was traceable to a woman carrier of the disease. At the trial experts disagreed on whether the epidemic was water borne or carrier borne. Bowen was found guilty of negligence in ignoring health department reports that foreign matter had been found in the Manteno water supply. He was first tried by a jury, which was discharged when it failed to reach a verdict. The second trial was without a jury.

Chicago

Branch Meetings.—Dr. William C. Menninger, Topeka, Kan., addressed the North Shore Branch of the Chicago Medical Society, April 1, on "Psychiatry in Every Day Life." A joint meeting of the South Side, South Chicago, Calumet and Stock Yards branches was addressed March 27 by Dr. Waltman Walters, Rochester, Minn., on "Newer Aspects of Physiology of the Kidney and Relation of Unilateral Kidney Infection to Hypertension." Dr. Louis G. Herrmann, Cincinnati, discussed "Practical Aspects of the Management of

Arterial Insufficiency in the Extremities" before the Aux Plaines Branch March 28. Dr. Elmer G. Horton, Columbus, Ohio, spoke before the Englewood Branch April 1 on "Some of the Changes in Pediatrics and Contagious Diseases During Fifty Years." Dr. John T. King, Baltimore, addressed the North Side Branch April 3 on "Effort Syndrome."

IOWA

State Medical Meeting in Davenport.—The Iowa State Medical Society will hold its ninetieth annual session at the Hotel Blackhawk, Davenport, May 14-16, under the presidency of Dr. Frank P. McNamara, Dubuque, and with the Scott County Medical Society acting as host. Included on the program will be the following out of state speakers:

- Dr. Charles W. Mayo, Rochester, Minn., Surgical Treatment of Carcinoma of the Lower Portion of the Colon.
- Dr. Fredrick A. Willius, Rochester, Certain Considerations of Coronary Disease.
- Brig. Gen. Shelley U. Marietta, Washington, D. C., Military Medicine in Its General Application.
- Dr. Nathan B. Van Etten, New York, President, American Medical Association, American Health and National Defense.
- Dr. Ralph C. Brown, Chicago, Hydrochloric Acid Neutralization and Other Factors in Treatment of Gastric and Duodenal Ulcer.
- Dr. Joseph L. Baer, Chicago, The Significance of Diagnosis in Obstetrics.
- Dr. Samuel Salinger, Chicago, Rhinoplasty from the Cosmetic Point of View.
- Dr. Raymond B. Allen, Chicago, The Need for Greater Interprofessional Cooperation in a Democracy.
- Dr. William H. Sebrell Jr., Washington, D. C., Vitamin B.
- Dr. John M. Shaul, New York, Clinical Aspect of the Newer Sulfonamide Drugs.
- Dr. Milton C. Winternitz, New Haven, Conn., Some Aspects of the Relation of the Kidneys to Cardiovascular Disease.
- Dr. William C. Beck, Chicago, Management of Lymphedema.

The sessions Wednesday and Friday afternoons will be devoted to sectional conferences; on Thursday afternoon the society will be host to the Iowa Interprofessional Association. Entertainment will include a military surgeons' dinner Wednesday evening, addressed by General Marietta; a smoker, annual banquet and various luncheons. The Central States Society of Industrial Medicine and Surgery will conduct a symposium on trauma Tuesday afternoon May 13. Out of state speakers will include Drs. Willard Van Hazel, Chicago; John L. Garvey, Milwaukee; James E. M. Thomson, Lincoln, Neb., and William R. Cubbins, Chicago. Dr. Hiram Winnett Orr, Lincoln, will address the dinner session on "Relationship of the New Antiseptics to the Treatment of Infected Wounds and Septicemia." The State Society of Iowa Medical Women and Branch 19, American Medical Women's Association, will meet Wednesday May 14. The woman's auxiliary to the state medical society will hold its twelfth annual meeting on May 9.

MASSACHUSETTS

Meeting of Biologists.—The Boston Society of Biologists will meet at the Harvard Medical School, Boston, April 30, with the following speakers:

- Dr. Albert H. Coons, Chemical Conjugation of Antibodies Without Destruction of Their Function.
- Herbert R. Morgan, A.M., Production of a Condition Resembling Typhoid Fever by Means of a Purified Antigen of the Typhoid Bacillus.
- John F. Enders, Ph.D., Results Obtained in a Laboratory Study of the Recent Epidemic of Influenza.
- J. Howard Mueller, Ph.D., The Production of Tetanus Toxin on a Peptone-Free Medium.

MICHIGAN

Dr. Douglas Named Health Commissioner of Detroit.—Dr. Bruce H. Douglas, acting superintendent of Herman Kiefer Hospital and tuberculosis controller for the Detroit Department of Health, has been appointed health commissioner of Detroit, effective April 15, to succeed Henry F. Vaughan, Dr.P.H., who resigned to become professor of public health at the University of Michigan, Ann Arbor. Dr. Douglas graduated at Rush Medical College, Chicago, in 1921. He went to the William H. Maybury Sanatorium, Northville, in 1922, becoming superintendent in 1924. He became tuberculosis controller for the Detroit board of health in 1933 and in the same year was chosen president of the Michigan Tuberculosis Association. Other appointments to the city department of health announced at this time include those of Dr. Joseph G. Molner as deputy commissioner and director of medical service, succeeding Dr. Fred M. Meader, who retired on January 1, and Dr. Garner M. Byington as associate physician and director of child welfare and school health service.

MINNESOTA

Dr. Wangenstein Wins Philadelphia Prize.—The John Scott Medal, given by the city of Philadelphia for outstanding achievement in medical science, has been awarded to Dr. Owen H. Wangenstein, professor and head of the department of surgery, University of Minnesota Medical School, Minneapolis, it is announced. The award, which also includes a cash gift of \$1,000, was made for Dr. Wangenstein's development of a suction siphonage treatment of acute intestinal obstruction. He received the Samuel Gross Medal from the Philadelphia Academy of Surgery in 1935. Dr. Wangenstein graduated at the University of Minnesota Medical School in 1922, taking a Ph.D. in surgery in 1925. The following year he joined the teaching faculty of his alma mater as instructor in surgery, becoming assistant professor in 1927, associate professor in 1928 and professor in 1931. He has been director of the department of surgery and surgeon in chief at University Hospital since 1930. In 1939 Dr. Wangenstein was chosen president of the Minnesota Pathological Society.

NEVADA

Personal.—Dr. Rodney E. Wyman, Reno, has been appointed superintendent of the Nevada State Mental Hospital, Reno, succeeding Dr. James C. Ferrell, who resigned.

Annual Registration Due May 1.—All persons holding licenses to practice medicine in Nevada are required by law to pay annually to the treasurer of the Board of Medical Examiners, on or before May 1, a tax of \$2. Failure to do so operates to forfeit a licentiate's right to practice medicine, and his license to practice can be reinstated thereafter only on the payment of a \$10 penalty.

NEW YORK

Postgraduate Courses.—The council committee on public health and education of the Medical Society of the State of New York is sponsoring "teaching days" and postgraduate lectures for several counties. A teaching day on malignant disease was arranged for the Dutchess County Medical Society, Poughkeepsie, April 9, with Drs. Arthur Purdy Stout, George E. Binkley and Cornelius P. Rhoads, New York, as the speakers. Regional maternal welfare teaching days were held in Syracuse on April 3 with Dr. Henry W. Schoeneck, Syracuse, as chairman and in Rochester on April 9 with Dr. Ward L. Ekas, Rochester, the regional chairman. Dr. Clarence E. de la Chapelle, New York, arranged courses of five lectures on heart disease for Chenango County to be given in Norwich and Broome County in Binghamton weekly during April and the last on May 8. A course on general medicine was arranged by Dr. William S. Ladd, New York, for the Oneida County Medical Society, Utica, during March. One on hemorrhage arranged by Dr. Albert F. R. Andresen, Brooklyn, was given for the St. Lawrence County Medical Society in Ogdensburg and the Jefferson County Medical Society in Watertown on five Thursdays beginning March 27. The Tioga County Medical Society had a course on obstetrics alternately in Waverly and Oswego on Wednesdays from March 26 to April 23.

New York City

Course in Tropical Medicine.—The New York Post-Graduate Medical School, Columbia University, announces a five day course in "Recent Advances in Tropical Medicine," May 19-23, under the direction of Dr. Zacharias Bercovitz. Authorities in their respective fields will give lectures and demonstrations, clinical and laboratory material will be available for study and the students will have an opportunity for practical work in clinical parasitology. The lecturers and their subjects will include:

- Malaria, Dr. Lowell T. Coggeshall, Rockefeller Institute for Medical Research.
- Yellow fever, Dr. Johannes H. Bauer, Rockefeller Institute.
- Intestinal parasites (helminths), Norman R. Stoll, Sc.D., Rockefeller Institute.
- Amebic dysentery, Drs. Thomas T. Mackie, Columbia University College of Physicians and Surgeons; Ralph W. Nauss, Cornell University Medical College, and Dr. Bercovitz.
- Bacillary dysentery, Drs. Ralph S. Muckenfuss and Samuel Frant, New York City Department of Health, and Dr. Bercovitz.
- Tropical skin diseases, Dr. Howard Fox, consulting dermatologist, Bellevue Hospital.
- Kala-azar, Dr. Claude E. Forkner, Cornell University.
- Leptospirosis, relapsing fever and ratbite fever, Dr. Elliston Farrell, Long Island College of Medicine, Brooklyn.
- Lymphogranuloma venereum, Dr. Arthur W. Grace, Long Island College.

OHIO

Dr. Crile Improves.—Dr. George W. Crile, Cleveland, who developed pneumonia following injury in an airplane accident near Vero Beach, Fla., April 3, is reported to be improving and is expected to be able to return to Cleveland soon.

PENNSYLVANIA

Society News.—Dr. Jacob Goldblum, Uniontown, addressed the Fayette County Medical Society in Uniontown, April 3, on "The Field of X-Ray Therapy."—Dr. Hobart A. Reimann, Philadelphia, was the guest speaker and clinician at the annual spring clinic of the Lycoming County Medical Society, Williamsport, April 11, on "Undulant Fever."—Dr. Leonard F. Bush, Danville, addressed the Centre County Medical Society, Bellefonte, April 10, on "Minor Surgery in the Office."—Drs. John W. Shirer, Pittsburgh, and Lytle John Powell, Bellevue, addressed the Mercer County Medical Society, Grove City, April 9, on disease of the thyroid and peritoneoscopy, respectively.

TEXAS

State Medical Meeting at Fort Worth.—The seventy-fifth annual session of the State Medical Association of Texas will be held May 13-15 at the Hotel Texas, Fort Worth, under the presidency of Dr. Preston Hunt, Texarkana. Guest speakers will address general and section meetings and will also participate in clinical discussion luncheons. Addresses at the general meetings will be:

- Dr. Ralph H. Major, Kansas City, Mo., Importance of Physical Diagnosis in the Practice of Medicine.
- Dr. Everett D. Plass, Iowa City, Hypertension in Pregnancy.
- Dr. Algernon B. Reese, New York, The More Recent Advances in Ophthalmology.
- Dr. Frederic W. Schlutz, Chicago, Present Day Possibilities of Endocrine Therapy in Pediatrics.
- Dr. William J. Kerr, San Francisco, Angina Pectoris—Etiology, Differential Diagnosis and Treatment.
- Dr. Roscoe R. Graham, Toronto, Ont., Present Status of Surgical Procedures in the Biliary Tract.
- Dr. George W. Holmes, Boston, Present Status of Radiation Treatment of Neoplastic Diseases.
- Dr. James B. McNaught, San Francisco, Medical and Public Health Aspects of Trichinosis.
- Dr. Lawrence S. Fallis, Detroit, Diagnosis and Treatment of Pancreatitis.
- Dr. Waller S. Leathers, Nashville, Tenn., Recent Advances in Public Health.

Related organizations that will hold their annual meetings on Monday May 12 are the Texas Railway and Traumatic Surgical Association, Texas Society of Gastro-Enterologists and Proctologists, Texas State Heart Association, Texas Allergy Association, Texas Orthopedic Association, Texas Association of Medical Anesthetists, Texas Neurological Society and the Conference of County and City Health Officers. The Texas Pediatric Society will observe its twentieth anniversary with a dinner and dance. A Texas chapter of the American College of Chest Physicians will be organized on May 13. The guest speakers of the state medical association will address some of these special societies. The Woman's Auxiliary will hold its twenty-third annual session, May 12-14.

WASHINGTON

Annual Surgical Meeting.—The Spokane Surgical Society held its annual meeting April 19 at the Davenport Hotel, Spokane, with Dr. Alfred Blalock, professor of surgery at Vanderbilt University School of Medicine, Nashville, Tenn., as guest speaker. Dr. Blalock conducted a round table discussion on "Preoperative and Postoperative Treatment of Surgical Patients" and spoke in the afternoon on "Surgery of Several Types of Diseases of the Heart and Pericardium." In addition, he delivered an address at the banquet on "Shock: A Consideration of the Pathogenesis, Prevention and Treatment."

GENERAL

Society News.—Dr. George R. Wilkinson, Greenville, S. C., was named president-elect of the Tri-State Medical Association of the Carolinas and Virginia at the annual meeting in Greensboro, N. C., recently, and Dr. Addison G. Brenizer, Charlotte, N. C., was installed as president. Vice presidents elected were Drs. Joseph W. Hooper, Wilmington, N. C.; Henry P. Langston, Danville, Va., and George H. Bunch, Columbia, S. C. Dr. James M. Northington, Charlotte, was reelected secretary. Next year's meeting will be in Greenville, S. C.

Current List of Medical Literature.—The Army Medical Library has recently begun publication of the *Current List of Medical Literature* as an adjunct of the Medicofilm Service operated by the library. Titles are listed in a form resembling the table of contents in a journal, under general headings such as "Anatomy, Embryology, Morphology," "Cardiology," "Dietetics, Metabolism," "Hospital Publications." The list is published weekly under the auspices of the executive committee of the Friends of the Army Medical Library and the subscription price is \$5.

Awards in Traffic Safety Contest.—Dallas, Texas, and Kansas City, Mo., tied for first place among cities in the traffic safety contest conducted annually by the National Safety Council. Connecticut won the grand award for states. Dallas and Kansas City were also tied for first place in the group of cities with populations between 250,000 and 500,000. Washington was first in cities with 500,000 or more of population; Chattanooga, Tenn., in the 100,000 to 250,000 group; Lakewood, Ohio, in the 50,000 to 100,000 group; Watertown, N. Y., in the 25,000 to 50,000 group; La Grange, Ill., in the 10,000 to 25,000 group. In addition, one hundred and forty-one cities were placed on a special honor roll for going through 1940 without a traffic fatality. Bronze plaques were awarded to governors and mayors of the winning states and cities at the Hotel Mayflower, Washington, D. C., April 21.

Midwest Safety Conference.—The nineteenth annual Midwest Safety Conference will be held at the Sherman Hotel, Chicago, May 6-8. Among the many speakers on the program are:

William H. Lehmberg, American Optical Company, Stockbridge, Mass., Eye Defense Against Attack by Rays.

A. K. Gaetjens, Nela Park Engineering Department, General Electric Company, Cleveland, What Proper Illumination Means to Your Health and Safety.

Dr. Cleveland J. White, Chicago, Occupational Dermatitis as It Occurs in Industry Today.

Major George D. Rogers, safety officer, Office of the Chief of Ordnance, War Department, Washington, D. C., Controlling Health Hazards in Explosives—Operating and Ammunition-Loading Plants.

V. A. Zimmer, director, Division of Labor Standards, U. S. Department of Labor, Washington, will give the principal address at the luncheon Wednesday on "The National Defense Program." A symposium on first aid in national defense will follow.

Impostor Obtains License.—The Indiana State Board of Medical Registration and Examination reports that through misrepresentation and error a license to practice medicine was issued to one Howard Glaesner by the clerk of Dubois County in October 1940. The license was subsequently presented to the clerk of Daviess County as authority for a license in that county. All county clerks and all state licensing boards and agencies have been notified that these licenses have been canceled by the Indiana board. So far as can be determined, Glaesner is not in Indiana, the board reported on April 3. A letter from the California State Board of Medical Examiners to the Indiana board stated that Glaesner had defaulted on a car in Los Angeles and that the car had been recovered there on Dec. 5, 1940. Any information concerning Glaesner or the Indiana licenses used by him should be forwarded to the Indiana State Board of Medical Registration and Examination, Indianapolis.

Donates Bowling Trophy.—Mead Johnson & Co., Evansville, Ind., has offered a perpetual trophy to the American Medical Bowling Association, the organization of which is now under way. According to the *Bulletin* of the Los Angeles County Medical Association, the first annual tournament will be held in Cleveland during the annual session of the American Medical Association. Teams of physicians will compete for the trophy, which will be retained one year by the championship team. In California, where the idea to form the national group originated, a state tournament will be held at the annual meeting of the California Medical Association in Del Monte May 5-8, the winning team to bowl in the national tournament. A tournament was planned for the Arizona State Medical Association at its meeting, April 16-19. Many county medical societies throughout the country have established leagues. Information concerning the American Medical Bowling Association may be obtained from Dr. Lewis Wine Bremerman, 1709 West Eighth Street, Los Angeles.

Subspecialties of Internal Medicine.—The American Board of Internal Medicine has worked out a plan for certification of physicians in the following subspecialties of internal medicine: allergy, cardiovascular diseases, gastroenterology and tuberculosis. The plan was approved by the Council on Medical Education and Hospitals of the American Medical Association and the Advisory Board for Medical Specialties at their recent meetings in Chicago. Accordingly, all candidates must pass the same written examination in internal medicine. Those successful in the written examination are eligible for the practical examination given each year before the meetings of the American Medical Association and the American College of Physicians. The examination on the long case will be given by a team led by a member of the American Board of Internal Medicine. The examination on the short case will be given by a team composed of a member of the board and an examiner in the subspecialty. After this portion of the examination is finished, the candidate will be turned over to the examiner in the subspecialty for examination in special techniques.

History of Roentgen Rays.—A four reel sound motion picture telling the history of roentgen rays and explaining their applications in laymen's language has been produced by the General Electric X-Ray Corporation for exhibition before lay audiences. The film will be lent free of charge except for transportation costs, to physicians who are asked to appear before luncheon clubs, parent-teacher associations, study groups and technical societies. Through the story of a medical student who goes to a radiologist for a roentgen examination, the film shows the discovery of the rays by Roentgen, their early use by pioneering physicians, illustrations of the medical, dental, veterinary and industrial applications. It includes an explanation of the physics of x-ray production by William D. Coolidge, Ph.D., director of research of the General Electric Company, Schenectady, N. Y., and inventor of the hot cathode x-ray tube that bears his name. The picture was professionally produced, partly in Hollywood and partly in hospitals and industrial plants in a number of cities. A leaflet describing the picture and including instructions for reserving it for exhibition is available from the General Electric X-Ray Corporation, Chicago.

Gastroenterological Association.—The sixth annual convention of the National Gastroenterological Association will be held at the Commodore Hotel, New York, May 13-16, under the presidency of Dr. Anthony Bassler, New York. Included among the speakers will be:

Dr. Harry E. Bacon, Philadelphia, Motion Picture Demonstration of Hemorrhoidectomy.

Drs. Frank J. Gregg and Roy R. Snowden, Pittsburgh, Diagnosis of Functional Dyspepsia.

Dr. Thomas G. Simonton, Pittsburgh, Management and Treatment of Cases of Cholera Morbus and Acute Ptomain Poisoning.

Drs. George M. Curtis and Frank E. Hamilton, Columbus, Ohio, Effects of Duodenal Ulcer with Obstruction on the Motor Activity of Human Stomach.

Dr. Richard H. Sweet, Boston, Transthoracic Gastrectomy.

There will be round table conferences on "Pathogenesis of Cholelithiasis," "Criteria in the Differential Diagnosis of Ulcers and Carcinoma of the Stomach" and "A Consideration of the New Forms of Medical Therapy of Ulcers of the Stomach and Duodenum." Friday has been designated "Clinical Day," with sessions at the various hospitals in Manhattan, Bronx and Brooklyn. The general program also includes an address by Dr. Frank H. Lahey, Boston, President-Elect of the American Medical Association.

CANADA

Epidemics in Halifax.—Epidemics of diphtheria, meningitis and scarlet fever ravaged the city of Halifax, N. S., during the winter, it was recently announced when investigators from Harvard Medical School, Boston, returned from several weeks spent in helping fight the diseases. A report has been prepared for the U. S. Public Health Service. Newspapers pointed out that the city's population of 70,000 had been doubled under wartime necessities, and that one out of three of its physicians had been called into army or navy service. It is believed that the diseases were introduced in part by ships' crews. At least one strain of scarlet fever organism previously unknown in Canada was identified. Diphtheria was widespread. Members of the Harvard team included J. Howard Mueller, Ph.D., associate professor of immunology and bacteriology at the medical school, who was in charge; Drs. Leroy D. Fothergill, Silas Arnold Houghton assistant professor of bacteriology and immunology and associate in pediatrics; Emanuel B. Schoenbach, instructor in bacteriology; John H. Dingle, assistant in bacteriology and in medicine; Stafford M. Wheeler, instructor in preventive medicine and epidemiology, and Lewis Thomas, research fellow in neurology at Thorndike Memorial Laboratory. In addition, Misses Agnes Gallegan, Pauline Miller and Jane Hinton, Mrs. Anna Kling and Mrs. Thomas were technical and secretarial assistants.

Foreign Letters

LONDON

(From Our Regular Correspondent)

Feb. 22, 1941.

The Bombing of a Great London Hospital

The bombing of two of the great London hospitals has been described in previous letters. The bombing of a third, St. Bartholomew's, the oldest and the second largest of the London hospitals, can be added.

On the night of December 29 thousands of incendiary bombs were dropped on the small part of London known as "the city" (in which the hospital is situated). The hospital was temporarily deprived of its supply of gas and of one circuit of electricity, which worked the lifts. At 10 p. m. the police stated that the fire department had difficulty in checking the flames and that if they got nearer to the hospital complete evacuation might be necessary at short notice. As any evacuation would take considerable time and as the lifts were not working, it was decided to evacuate immediately 100 of the 225 patients that night. The hospital has six hundred and ninety-two beds; the small number of patients was due to war evacuation. The patients were carried on stretchers down the stairs and loaded into busses by the porters and volunteers from among the students and were taken to a hospital outside London. All this was done smoothly and efficiently under trying conditions.

On another occasion the hospital had to work at full pressure to treat a large number of casualties from an air raid. The majority required surgical treatment, and it was necessary to acquire the additional services of a mobile team. In spite of this assistance the operating rooms were in use all night and much of next day. The damage caused by incendiary bombs has emphasized the need for adequate protection against fire. Every roof is fitted with fire fighting appliances and six regular fire squads are on duty each night. In addition, much help has been given by the students on all occasions when incendiary bombs have been dropped on the hospital. On one night a dozen were dealt with in the space of a few minutes.

Physicians' Work in Air Raids

It has been said that bombing from the air of towns and cities has put civilians in the front line of the war. This applies especially to the work of treating the injured. Our hospitals have suffered much, and doctors and nurses have been killed and injured while attending to those brought in from air raids in progress. The same has occurred in their first aid work outside, and many heroic deeds have been recorded. The most recent, for which the George medal (recently instituted for civilian acts of bravery) has been awarded, is the following:

A bomb explosion collapsed a tunnel in which some people were trapped in northern London. The health officer, Dr. Malcolm Manson, worked for nearly three hours to release them, giving medical aid all the time and keeping effective control. Throughout this time he was in grave personal danger from frequent falls of clay. At one time he was partially buried in a large fall. He had to be dragged out feet foremost, but after a few minutes rest he carried on. His disregard of personal safety saved several lives, although he sustained serious injuries during the rescue operations. This incident is typical of many courageous acts performed by physicians in the attacks from the air on the civilian population.

British Ambulances for Greece

The British Volunteer Ambulance Corps has presented to Greece eighteen ambulances for service with the Greek army. The ambulances are constructed to a special design of double

steel lined bodies with a flat steel roof under the corrugated steel one. The stretcher equipment is of the most modern type with fittings for 4 recumbent patients, easily convertible into accommodation for 14 or 16 sitting patients. Each ambulance is provided with four stretchers of standard army design.

The British Volunteer Ambulance Corps at present has eighty-five ambulances working with the British army, including two manned sections, one with male and the other with female ambulance drivers. The corps has received a gift of seventy-five ambulances from America, fifty-six of which are now in service.

Milk Restrictions

The continuance of the war involves further food restrictions. In the House of Lords the minister of food, Lord Woolton, dealt with that most important food—milk—the distribution of which is already controlled. In spite of all the conditions of aerial bombardment the country had every morning been supplied with milk without interruption and almost without delay. The average consumption of milk was 1 gallon a week per family. We must expect difficulty in maintaining milk production at the present level. The shortage of imported foodstuffs was likely to increase, and other difficulties arising from the war would tend to diminish the milk supply. Under the national milk scheme, introduced last July, 10,000,000 gallons of milk was distributed to 2,800,000 people. About one third received the milk free and the others paid the reduced price of 4 cents a pint. An unrestricted supply of milk to nursing and expectant mothers and young children would be given priority in taking care of 5,500,000 people. Arrangements were being made to maintain supplies to hospitals and to sick persons under certain prescribed conditions. Having done this, the minister must conserve the remainder of our milk supplies in order that they might be available for the greatest need of the nation.

British Civil Defense

Surgeon General Parran, of the United States Public Health Service, is in England to study civil defense in relation to public health, the reactions of the public to air bombardment and the linking up of civil defense with the normal public health services. He has been deeply impressed with the organization and the manner in which the public is cooperating with the authorities. He and Lord Horder and Mr. Fred Horner, of the American Transport Service, were the guests at a luncheon given by the mayor of Kensington. Surgeon General Parran said that while the whole business of military science had engaged the best minds in every country there had been developing in these islands a comparable science of military defense, utilizing volunteers, men and women, improvising from month to month without any background, to meet terrible conditions. He referred to the remarkable development of the science of aviation and to the rapid development of the machine, but he believed that biologic science would catch up with the mechanical. Before he left America he talked with the President of the United States on the problems of civil defense, who referred particularly to the women's part and to the unpaid volunteers in cooperating with the official agencies and the professions concerned and asked him to bring back news as to the ways and means in which they were working here.

Marriages

CHARLES EMERSON TRIBBLE, DeLand, Fla., to Miss Ann Bernice Jennings of Green Cove Springs, February 9.

LEO J. ESCHELBACHER, Mount Vernon, Ill., to Miss Inge Wachelheim of Chicago in St. Louis, February 4.

ROBERT DANIEL WARNKE, Milford, Neb., to Miss Irene Roberta Langdon of Detroit, February 15.

Deaths

John Joseph MacPhee ☉ New York; University of Vermont College of Medicine, Burlington, 1890; in 1891 demonstrator of clinical microscopy, promoted to be lecturer in neurology in 1910, professor of neurology in 1911 and served in this capacity until 1926 when he became emeritus professor of neurology and consulting neurologist at the New York Post-Graduate Medical School; served during the World War; member of the Association for Research in Nervous and Mental Disease; visiting neurologist to St. Francis Hospital, Harlem Eye and Ear Hospital and the Bronx Eye and Ear Infirmary; consulting neurologist, St. John's Long Island City Hospital and the Misericordia Hospital; aged 80; died, February 18, of pneumonia.

Daniel E. S. Coleman, New York; New York Homeopathic Medical College and Hospital, New York, 1901; fellow of the American College of Physicians; instructor in materia medica, 1905-1906, instructor and clinical assistant to the chair of homeopathic philosophy, 1906-1907, instructor of materia medica and clinical assistant to the chair of homeopathic therapeutics, 1907-1908, instructor in materia medica, 1908-1909, lecturer in materia medica, 1909-1910, assistant professor of materia medica from 1910 to 1913 and professor of materia medica from 1913 to 1918 at his alma mater; aged 68; died, February 27, of myocarditis and acute nephritis following influenza.

George Francis Mills, Utica, N. Y.; University of Buffalo School of Medicine, 1899; member of the Medical Society of the State of New York; served during the World War; past president and secretary of the Madison County Medical Society; formerly coroner, health officer and school physician in Oneida; on the staff and formerly member of the board of directors of the Oneida (N. Y.) City Hospital; aged 66; on the staff of St. Elizabeth's Hospital, where he died, February 16, of heart disease.

Timothy Joseph O'Sullivan ☉ Portland, Maine; Boston University School of Medicine, 1914; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; served during the World War; otolaryngologist, Children's Hospital; associate otolaryngologist, Maine General Hospital; on the staff of the State Street Hospital; consultant, Webber Hospital, Biddeford, and Henrietta D. Goodall Hospital, Sanford; aged 54; died, February 16.

Heber K. Merrill, Logan, Utah; Northwestern University Medical School, Chicago, 1905; member of the Utah State Medical Association; president of the Utah Hospital Association; past president of the Cache County Medical Society; formerly member of the state board of health; medical director of the Cache Valley General Hospital; formerly bank president and member of the city board of education; aged 71; died, February 4, of coronary occlusion.

Edmund Levings Warren, St. Paul; Columbia University College of Physicians and Surgeons, New York, 1910; member of the Minnesota State Medical Association; member of the executive committee of the Children's Hospital and member of the staffs of St. Luke's, Miller, St. Joseph's and Gillette hospitals; aged 56; died, February 19, of chronic nephritis and essential hypertension.

Hubert Marvin Meredith ☉ Scottsville, Ky.; University of Tennessee Medical Department, Nashville, 1901; formerly secretary of the Allen County Medical Society; served during the World War; at one time member of the board of education and city council; aged 62; died, February 16, in St. Thomas Hospital, Nashville, of aortic aneurysm.

Fred Elwell Earel ☉ Santa Ana, Calif.; University of Illinois College of Medicine, Chicago, 1916; formerly mayor of Hoopston, Ill.; served during the World War; on the staff of the Orange County Hospital and St. Joseph Hospital, Orange, and the Fullerton (Calif.) Hospital; aged 49; died, February 11, of cerebral hemorrhage.

Henry John Louis Schroeder, Trenton, N. J.; Long Island College Hospital, Brooklyn, 1898; member of the Medical Society of New Jersey; on the staff of the New Jersey Sanatorium for Tuberculous Disease, Glen Gardner; aged 67; died, February 13, in the Kings County Hospital, Brooklyn, of arteriosclerosis and bronchopneumonia.

Herbert Rankin Struthers, Grayslake, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; member of the Illinois State Medi-

cal Society; served during the World War; aged 68; died, February 2, in the Veterans Administration Facility, Hines, of hypertrophy of the prostate.

Jesse Garfield Maxon ☉ Harvard, Ill.; Hahnemann Medical College and Hospital, Chicago, 1910; past president and secretary of the McHenry County Medical Society; for many years mayor; served during the World War; formerly president of the McHenry County Tuberculosis Association; aged 60; died, February 7.

George Balthasar Spath ☉ Hoboken, N. J.; Medico-Chirurgical College of Philadelphia, 1900; medical examiner of a draft board; a trustee of the adult education bureau; on the staff of the Fairmount Hospital and Christ Hospital, Jersey City, and St. Mary's Hospital; aged 66; died, February 26, of myocarditis.

Thomas Bernard Latane, South Richmond, Va.; University of the South Medical Department, Sewanee, Tenn., 1903; member of the Medical Society of Virginia; aged 68; died, February 18, in the Johnston-Willis Hospital, Richmond, of hypertension and hemiplegia.

Edward Anderson Holmes, Marion, Va.; University of Virginia Department of Medicine, Charlottesville, 1897; member of the Medical Society of Virginia; for many years county coroner; served during the World War; aged 67; died, February 4, of heart disease.

Claude Leonard Pridgen, Gainesville, Fla.; Jefferson Medical College of Philadelphia, 1901; served during the World War; member of the executive staff of the state board of health of North Carolina, 1913-1914; aged 63; died, February 6, of coronary thrombosis.

Charles E. Spitler, Saratoga, Ind.; St. Louis College of Physicians and Surgeons, 1891; member of the Indiana State Medical Association; for many years health officer and bank president; aged 77; died, February 3, of heart disease and arteriosclerosis.

Mark Dickens Hoyt, Glasgow, Mont.; University of Pennsylvania Department of Medicine, Philadelphia, 1891; member of the Medical Association of Montana; mayor; county health officer; aged 72; died, February 12, of carcinoma of the esophagus.

Reginald C. McDonald Millar ☉ Foristell, Mo.; Barnes Medical College, St. Louis, 1904; formerly county health officer; served during the World War; aged 63; died, February 19, in the Central Hospital, St. Louis, of bronchopneumonia and influenza.

Willis B. Huron, Tipton, Ind.; Hahnemann Medical College and Hospital, Chicago, 1886; past president and secretary of the Tipton County Medical Society; formerly health officer; aged 82; died, February 13, of arteriosclerosis and coronary disease.

Lloyd Albert Heikes ☉ Lemoyne, Pa.; Medico-Chirurgical College of Philadelphia, 1910; was president of the board of health of Lemoyne; aged 58; died, February 3, in the Harrisburg (Pa.) Polyclinic Hospital of influenza and pneumonia.

Perley Lewis Sanborn, Marblehead, Mass.; Bellevue Hospital Medical College, New York, 1877; member of the Massachusetts Medical Society; on the staff of the Mary Alley Hospital; aged 89; died, February 3, of acute enteritis.

Albert A. Wikoff, Portsmouth, Ohio; Starling Medical College, Columbus, 1898; member of the Ohio State Medical Association; on the staff of the Portsmouth General Hospital; aged 71; died, January 25, of carcinoma of the rectum.

John Hammel Nichols ☉ Mansfield, Ohio; Rush Medical College, Chicago, 1896; fellow of the American College of Surgeons; on the staff of the Mansfield General Hospital; aged 67; died, February 10, of coronary thrombosis.

Irving Medbury Addleman ☉ Wausau, Wis.; Milwaukee Medical College, 1906; past president of the Marathon County Medical Society; aged 71; on the staff of St. Mary's Hospital; died, February 25, of coronary heart disease.

William Henry Donovan Jr., Iowa City; State University of Iowa College of Medicine, Iowa City, 1936; aged 25; died, February 18, in a hotel at Beaumont, Texas, of heart disease following an undiagnosed fever.

Samuel Lawson Reveley, San Antonio, Texas; University of Arkansas School of Medicine, Little Rock, 1915; member of the State Medical Association of Texas; aged 61; died, February 1, of cerebral hemorrhage.

William E. Johnson ☉ Warrensburg, Mo.; Barnes Medical College, St. Louis, 1896; past president of the Johnson County Medical Society; aged 65; died, February 3, of cerebral hemorrhage and arteriosclerosis.

Archie Lowe McElroy, Fort Worth, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1909; aged 56; died, February 1, in All Saints Hospital of pulmonary tuberculosis.

Thomas Dawson McKnight, Brundidge, Ala.; Birmingham Medical College, 1912; member of the Medical Association of the State of Alabama; aged 58; died, February 5, of an accidental gunshot wound.

William Emory Stephens, Barnesville, Ohio; Medical College of Ohio, Cincinnati, 1903; aged 65; died, February 13, in St. Francis Hospital, Cambridge, of cerebral hemorrhage and diabetes mellitus.

John Thomas McCullough, Nipawin, Sask., Canada; McGill University Faculty of Medicine, Montreal, Que., 1919; served during the World War; aged 54; died, January 8, of accidental poisoning.

Merion E. Kemerer, Danielsville, Pa.; College of Physicians and Surgeons, Baltimore, 1897; aged 66; died, February 11, in the Haff Hospital, Northampton, of hypertrophic cirrhosis of the liver.

Allan Edward Schriver, Brewer, Maine; Medical School of Maine, Portland, 1896; member of the Maine Medical Association; formerly health officer; aged 72; died, January 24, of cardiac embolism.

Angus M. Frew, Hudson, Ohio; Hospital College of Medicine, Louisville, Ky., 1898; aged 67; died, February 12, in Akron of coronary thrombosis following an operation for intestinal obstruction.

Oscar S. Neff, Flagler, Colo.; Hahnemann Medical College and Hospital, Chicago, 1895; member of the Colorado State Medical Society; aged 73; died, January 28, of carcinoma of the prostate.

Clark Stetson Bogart, Kane, Pa.; University of Maryland School of Medicine, Baltimore, 1914; served during the World War; aged 49; died, February 16, of encephalitis and coronary occlusion.

George Henry Gillette, New York; Harvard Medical School, Boston, 1915; member of the Medical Society of the State of New York; aged 55; died, February 21, of coronary sclerosis.

Abner Richard Marcotte, Selden, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1902; aged 61; died, February 12, in Omaha, of carcinoma of the liver.

Foster Fitch Eaton, Truro, N. S., Canada; University of the City of New York Medical Department, New York, 1889; aged 77; died, January 17, of coronary thrombosis and diabetes mellitus.

John Russell Fridge, Baton Rouge, La.; Louisville (Ky.) Medical College, 1889; aged 78; died, February 18, in Our Lady of the Lake Sanitarium of acute dilatation of the heart.

Linwood Major Kelley, Manchester, Vt.; University of Vermont College of Medicine, Burlington, 1904; served during the World War; aged 64; died, February 20, of heart disease.

Rosaire Rolland, Montreal, Que., Canada; University of Montreal Faculty of Medicine, Montreal, 1922; chief medical officer of the port of Montreal; aged 48; died, January 24.

Frank A. Duvally, Fall River, Mass.; College of Physicians and Surgeons, Baltimore, 1910; aged 56; died, February 4, in the Truesdale Hospital of carcinoma of the esophagus.

John B. Walton, Martin, S. D.; Bennett College of Eclectic Medicine and Surgery, Chicago, 1907; aged 58; died, January 21, in Rochester, Minn., of acute ulcerative endocarditis.

Eugene H. Judkins, Melrose, Mass.; Baltimore Medical College, 1892; aged 78; died, February 1, in the Worcester (Mass.) State Hospital of arteriosclerotic heart disease.

John Henry Weil, Philadelphia; Maryland Medical College, Baltimore, 1905; Hahnemann Medical College and Hospital of Philadelphia, 1906; aged 76; died, January 11.

William Henry Gooch, Elmer, Mo.; Barnes Medical College, St. Louis, 1898; county coroner; aged 69; died, February 1, in a hospital at Kirksville of coronary sclerosis.

John Samuel Bishop, Baltimore; University of Pennsylvania Department of Medicine, Philadelphia, 1895; aged 68; died, February 26, of bronchogenic carcinoma.

Isaac Beeson Hamilton, San Diego, Calif.; University of Pennsylvania Department of Medicine, Philadelphia, 1883; aged 82; died, February 4, of coronary thrombosis.

William Hodges, Tyler, Texas (licensed in Texas, under the Act of 1907); aged 73; died, February 4, of hypostatic pneumonia following fracture of the femur.

George Everett Sleeper, Hartford, Conn.; Dartmouth Medical School, Hanover, N. H., 1896; aged 70; died, January 13, of carcinoma of the anus and rectum.

John Dennis Herron, Canton, Ohio; Western Reserve University Medical Department, Cleveland, 1887; aged 80; died, February 3, of cerebral hemorrhage.

Clarence Martin O'Hara, Beaver Dam, Wis.; University of Illinois College of Medicine, Chicago, 1925; aged 45; died, February 5, of coronary thrombosis.

Gomer E. Jones, Oak Hill, Ohio; Miami Medical College, Cincinnati, 1896; past president of the Jackson County Medical Society; aged 74; died in February.

Edward James Pendergast, Jersey City, N. J.; Bellevue Hospital Medical College, New York, 1896; aged 67; died, February 8, of chronic myocarditis.

James Madison Britton, El Paso, Texas; University of Nashville (Tenn.) Medical Department, 1899; aged 74; died, February 9, of diabetes mellitus.

Ruth Alexander, Honolulu, Hawaii; Woman's Medical College of Pennsylvania, Philadelphia, 1909; aged 52; died, January 18, of mitral stenosis.

Ada Maude Chevallier, Gallup, N. M.; American Medical College, St. Louis, 1891; aged 80; died, February 20, in Las Vegas of gangrene of the leg.

George E. Wheeler, Villa Park, Ill.; Reliance Medical College, Chicago, 1909; also a dentist; aged 72; died, January 29, in Sullivan of pneumonia.

Charles Holmes Kraner, Pickerington, Ohio; Starling Medical College, Columbus, 1905; aged 64; died, February 6, of carcinoma of the prostate.

Charles W. McCole, New Market, Iowa; College of Physicians and Surgeons, Keokuk, Iowa, 1892; aged 75; died, February 4, of nephritis.

Harry Dana Burchard, Falls City, Neb.; John A. Creighton Medical College, Omaha, 1908; aged 58; died, January 13, of cerebral hemorrhage.

William Edwin Julius Kirk, New York; Long Island College Hospital, Brooklyn, 1921; aged 64; died, February 18, of cerebral hemorrhage.

John Herbert Riley, Detroit; Detroit College of Medicine, 1910; aged 57; died, February 13, in the Providence Hospital of bronchopneumonia.

Peyton Matthew Price, Vandervoort, Ark. (licensed in Arkansas in 1906); aged 57; died, February 24, of heart disease and pneumonia.

Lazar Sasover, New York; Universitatea din Bucuresti Facultatea de Medicina, Rumania, 1905; aged 65; died, January 19, of heart disease.

Harry Elwood Breese, San Diego, Calif.; Kansas City (Mo.) Medical College, 1902; aged 69; died, January 1, of pulmonary edema.

L. W. Smith, South Boston, Va.; Leonard Medical School, Raleigh, 1902; aged 62; died, January 1, of cardiorenal disease and hypertension.

Edward Leo A. Brown, Dayton, Ohio; Medical College of Ohio, Cincinnati, 1897; aged 70; died, February 20, of cerebral sclerosis.

Charles Tupper Weeks, Tidnish, N. S., Canada; Baltimore University School of Medicine, 1885; aged 80; died, January 10.

Charles H. McDowell, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1887; aged 75; died, January 9.

William Hartman Heinz, Toledo, Ohio; Cleveland Medical College, 1877; aged 83; died, February 11, of coronary embolism.

John Davis Kales, Chicago; Harvard Medical School, Boston, 1887; aged 76; died, February 28, of carcinoma of the pancreas.

Benjamin E. Pearce, Atlanta, Ga.; Atlanta Medical College, 1895; aged 65; died, February 11, of coronary thrombosis.

James E. Boden, Milwaukee; Milwaukee Medical College, 1901; aged 67; died, February 23, of cerebral hemorrhage.

Elmer Ellsworth Reichard, Averill Park, N. Y.; Albany Medical College, 1892; aged 74; died, February 18.

Bureau of Investigation

THE MacLEVY "SLENDERIZING" RACKET

Recently the editor of a scientific journal for the public was approached by one Paula Gould, self-styled "publicity director" for the "MacLevy Slenderizing Equipment and Salons." The "publicity director" stated:

"With ten slenderizing salons in the metropolitan area and more than two hundred throughout the country, Monty MacLevy is definitely the greatest figure contouring expert in the country. . . . the MacLevy System has discarded entirely the old fashioned 'gym' methods of reducing by strenuous exercise and uses exclusively in all the salons mechanical equipment which brings an entirely new principle to figure conditioning, employing mechanical energy to break down fatty deposits and mold shapely contours while the user remains relaxed."

She continued:

"We had a most interesting three page layout of the slenderizing machines and equipment in *Life*, November 4th issue."

The editor asks THE JOURNAL:

"Is my previous understanding [correct] that, unless one at the same time that he caused his body thus to be vibrated and rolled by outside machinery, took added exercise, or ate less, or ate a special diet of the 'slow poison' reducing variety, or used some combination of these methods, the effects of being vibrated were exactly nil; is this supposition of mine perhaps too sweeping?"

"If vibration alone could bring about reduction, I should think the street workmen who run pneumatic picks all day, and years on end, would be walking skeletons, yet I see some pretty well rounded men doing this work."

The routine procedure in this particular type of charlatry is to exhibit pictures of some beautiful young actress or model and to imply that she obtained her voluptuous contours by the use of the device. The pictures in *Life*, in which "pretty Model Pat Ogden" is "placidly letting herself be electrically rolled in the Slendro Massager," are no exception to the rule.

Life conducted a rather typical piece of pseudoscientific research. Its article stated: "Along with Pat, *Life* sent its fattest researcher to play guinea pig for fat *Life* readers. She found the machines pleasant and generally painless. The Slendro Massager made her feel 'like a piece of dough being rolled,' but like a biscuit she felt no pain."

Continuing, *Life* reported that the "fattest researcher," who apparently investigated all the gadgets of Monty, "the greatest figure contouring expert," found that "The Roaler Massager makes you think that at last you're going to find out what it's like to ride a horse. Instead, the friction on your seat soon makes you think you've ridden through a whole rodeo. The Back Ring Roller makes you conscious of looking like a Salem witch in the stocks."

"The other machines that roll bulging stomachs, thighs, calves and ankles are also painless enough to allow reading, knitting, lunching or dozing. They made *Life's* reporter feel 'like a slowly deflating balloon.'"

Life gave a final comment from this remarkable investigation of its "fattest researcher": "As you look around the torture room and see the fat ladies standing in rows, you're amazed at their complacent contentment. They are all getting thin without an effort. They all still look as if they were munching chocolates."

Life's illustrations, with one exception, are of the comely Pat and not of its adipose investigator. In one picture Pat stands pensively in a machine with long arms which apparently move broad metallic springs over the front and back of her already shapely contour. In three other pictures she sits or lies on the "Roaler Massager," which is apparently a rolling barrel on a low framework. When she sits on it, it is said that "the machine works on thigh." When she lies across it in the prone position, it is said that "abdomen massage is achieved" and that the "Roaler Massager is popular because women can operate it by themselves, concentrate on any one spot."

In another picture the beautiful Miss Ogden sits in the "Back Ring Roller," which, it is said, is "designed to work on fatty parts of back from waist up." This elaborate gadget apparently moves a springlike roller up and down the back. Still another device is shown in the "Wooden Barrel Massager with rollers like clothes wringers." The subject stands between two sets of multiple rollers which rest against the buttocks and thighs. It

is said that this device "is designed for action on the hips and buttocks. When in work, rollers are closed in around body and spin."

Finally, the "Modified Slendro Massager" and the "Leg Roller" are illustrated. The leg roller apparently runs springlike rollers up and down the front and back of the thigh and also the calf. Miss Ogden, the model, sits complacently knitting while receiving this particular procedure, which, it is said, is employed "for those who find the slight effort of standing overtaxing."

It is interesting to note that although the publicity director for the MacLevy system stated that the old fashioned "gym" methods had been entirely discarded, the towel on which Miss Ogden is kneeling is marked "MacLevy Gym."

It is even more interesting to note that Monty MacLevy is president of the MacLevy Slenderizing Equipment & System, Inc., the Slendrow Preparations, Inc., Rollo Equipment, Inc., and the MacLevy Health Club, Inc., all at 122 East 42d Street, New York. He is also president of the MacLevy Gym & Bath Club, Inc., the MacLevy Athletic Club, located in New York and Brooklyn, respectively; and secretary of the MacLevy Slenderizing Salons of Philadelphia, Pa., East Orange, N. J., and Boston, Mass., and holds the same position in regard to the Westchester Slenderizing Salon, Inc., the Contour Slenderizing Salon, Inc., of Washington, D. C., and is president of the Flatbush Slenderizing Salon, Inc. He was formerly assistant general manager of the Madison Square Garden Swimming Pool and Gymnasium, and is a son of the late Maximilian MacLevy who for many years operated a gymnasium in New York City at the present address of the MacLevy Slenderizing Equipment & System, Inc.

This corporation is exclusive distributor for the "Rollo Massage Chair" and other slenderizing equipment manufactured by Rollo Equipment, Inc., and this organization issues franchises to operating companies for the right to use the name "MacLevy System." It is understood that the complete slenderizing equipment in one of these establishments has a retail sales value of about \$1,400. It has been intimated that such franchises require the use of cosmetics, sweat creams, body oils, etc., purchased from this corporation.

All this elaborate business of supplying the machinery and giving the treatments which supposedly rub away fatty tissue from regions in which it is not wanted is based on the general misconception concerning the action of massage on adipose tissue. Careful clinical observation by skilled physicians does not support this conception. Even the heaviest massage will not remove deposits of fat in various regions of the body. Rosenthal,¹ when he investigated this problem experimentally in a scientific manner, found that even the most vigorous massage of the abdominal wall of animals did not produce any destructive effect on the adipose tissue. After such heavy massage, histologic sections of the adipose tissue did not show any changes in the fat, although the pressure had been sufficiently severe to produce multiple hemorrhages.

Just as there has been much misunderstanding concerning the value of massage for obese persons, so is there considerable misconception concerning the usefulness of exercise for such persons. There is much truth in the facetious statement that the best exercise for the obese person to employ is "a rapid rotation of the head from right to left when the mashed potatoes and gravy are passed." Undoubtedly the only logical way of diminishing the amount of adipose tissue in the human body is to decrease the caloric intake or to increase the caloric output. There is no "easy way" to reduce fat. And there is no scientific evidence whatever to indicate that adipose tissue can be made to disappear by massage or by any other means from one region of the body without its disappearing in comparable amounts from other regions.

Of course, there will always be charlatans who will play on the common feminine weakness of desiring to obtain "shapely contours" without curbing appetite and self indulgence. The "MacLevy System" is a typical, rather flagrant example of this type of quackery. *Life's* editors can hardly be so gullible as to be convinced by this type of chicanery.

Medical Examinations and Licensure

COMING EXAMINATIONS

NATIONAL BOARD OF MEDICAL EXAMINERS

EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and Examining Boards in Specialties were published in *THE JOURNAL*, April 19, page 1868.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 17-19. Sec., Dr. J. N. Baker, 519 Dexter Ave., Montgomery.

ARKANSAS: * *Medical*. Little Rock, June 5-6. Sec., Dr. D. L. Owens, Harrison. *Eclectic*. Little Rock, June 5-6. Sec., Dr. Clarence H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Oral examination* (required when reciprocity application is based on a state certificate or license issued ten or more years before filing application in California), Los Angeles, July 14. *Written*. San Francisco, June 30-July 3. Sec., Dr. Charles B. Pinkham, 1020 N St., Samento.

DELAWARE: July 8-10. Sec., Medical Council of Delaware, Dr. Joseph S. McDaniel, 229 S. State St., Dover.

DISTRICT OF COLUMBIA: * Washington, May 12-13. Sec., Commission on Licensure, Dr. George C. Ruhland, 203 District Bldg., Washington.

FLORIDA: * Jacksonville, June 23-24. Sec., Dr. William M. Rowlett, Box 786, Tampa.

GEORGIA: Atlanta, June. Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol, Atlanta.

HAWAII: Honolulu, July 14-17. Sec., Dr. James A. Morgan, 48 Young Bldg., Honolulu.

INDIANA: Indianapolis, June 17-19. Sec., Board of Medical Registration and Examination, Dr. J. W. Bowers, Citizens Trust Bldg., Fort Wayne.

IOWA: * Iowa City, June 3-5. Dir., Division of Licensure and Registration, State Department of Health, Mr. H. W. Greffe, Capitol Bldg., Des Moines.

KANSAS: Kansas City, June 17-18. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.

KENTUCKY: Louisville, June 5-7. Sec., State Board of Health, Dr. A. T. McCormack, 620 S. Third St., Louisville.

MARYLAND: *Medical*. Baltimore, June 17-20. Sec., Dr. John T. O'Mara, 1215 Cathedral St., Baltimore. *Homeopathic*. Baltimore, June 17-18. Sec., Dr. John A. Evans, 612 W. 40th St., Baltimore.

MICHIGAN: * Ann Arbor and Detroit, June 11-13. Sec., Board of Registration in Medicine, Dr. J. Earl McIntyre, 202-4 Hollister Bldg., Lansing.

MISSISSIPPI: Jackson, June. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.

MISSOURI: St. Louis, May 29-31. Sec., State Board of Health, Dr. Harry F. Parker, State Capitol Bldg., Jefferson City.

NEBRASKA: * Omaha, June 12. *All applications must be on file not later than May 29*. Dir., Mrs. Jeanette Crawford, 1009 State Capitol Bldg., Lincoln.

NEVADA: Carson City, May 5. Sec., Dr. Fred M. Anderson, 215 N. Carson St., Carson City.

NEW JERSEY: Trenton, June 17-18. Sec., Dr. Earl S. Hallinger, 28 W. State St., Trenton.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 23-26. Chief, Bureau of Professional Examinations, 315 Education Bldg., Albany.

NORTH CAROLINA: Raleigh, June 16-20. Sec., Dr. W. D. James, Hamlet.

NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: *Practical*. June 11 and 14. *Written*. June 12-13. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, June 11-12. Sec., Dr. James D. Osborn Jr., Frederick.

PENNSYLVANIA: Philadelphia and Pittsburgh, July. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. Marguerite G. Steiner, 358 Education Bldg., Harrisburg.

SOUTH CAROLINA: Columbia, June 23-25. Sec., Dr. A. Earle Boozer, 505 Saluda Ave., Columbia.

SOUTH DAKOTA: * Pierre, July 15-16. Dir., Medical Licensure, Dr. J. F. D. Cook, State Board of Health, Pierre.

VERMONT: Burlington, June 17-19. Sec., Dr. F. J. Lawliss, Richford.

VIRGINIA: Richmond, June 17-20. Sec., Dr. J. W. Preston, 30½ Franklin Road, Roanoke.

WISCONSIN: * Milwaukee, June 24-27. Sec., Dr. H. W. Shutter, 425 E. Wisconsin Ave., Milwaukee.

WYOMING: Cheyenne, June 2-3. Sec., Dr. M. C. Keith, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARKANSAS: Little Rock, May 19. Sec., Mr. Louis E. Gebauer, 701 Main St., Little Rock.

CONNECTICUT: June 14. Address State Board of Healing Arts, 1945 Yale Station, New Haven.

FLORIDA: De Land, June 7. *Applications must be on file not later than May 24*. Sec., Prof. J. F. Conn, John B. Stetson University, De Land.

IOWA: Des Moines, July 8. Dir., Division of Licensure and Registration, State Department of Health, Mr. H. W. Greffe, Capitol Bldg., Des Moines.

NEBRASKA: Omaha, May 6-7. Dir., Mrs. Jeanette Crawford, 1009 State Capitol Bldg., Lincoln.

OKLAHOMA: Oklahoma City, May 22. Sec. of State, Hon. C. C. Childress, State Capitol, Oklahoma City.

OREGON: Corvallis, July 12. Sec., State Board of Higher Education, Mr. Charles D. Byrne, University of Oregon, Eugene.

SOUTH DAKOTA: June. Sec., Dr. G. M. Evans, Yankton.

Virginia December Report

Dr. J. W. Preston, secretary, Board of Medical Examiners of Virginia, reports the written examination for medical licensure held at Richmond, Dec. 4-6, 1940. An average of 75 per cent was required to pass. Fourteen candidates were examined, 13 of whom passed and 1 failed. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
George Washington University School of Medicine	(1940)	83, 85, 85	
Georgetown University School of Medicine	(1939)		83
Howard Univ. College of Medicine	(1939)	80, 86, 89, (1940)	85
Creighton University School of Medicine	(1940)		85
Univ. of Pennsylvania School of Medicine	(1937)	80, (1939)	84
University of Toronto Faculty of Medicine	(1939)		84
McGill University Faculty of Medicine	(1934)		86

School	FAILED	Year Grad.	Number Failed
Université de Genève Faculté de Médecine	(1936)		1

Thirty-four physicians were licensed to practice medicine by reciprocity and 6 physicians so licensed by endorsement from September 9 through December 6. The following schools were represented:

School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
George Washington University School of Medicine	(1929)		New York
Howard University College of Medicine	(1911)		New York
University of Georgia School of Medicine	(1937)		W. Virginia
Northwestern University Medical School	(1903)		Iowa
University of Illinois College of Medicine	(1935)		Dist. Colum.
Indiana University School of Medicine	(1927)		Indiana
State University of Iowa College of Medicine	(1939)		Iowa
University of Kansas School of Medicine	(1937)		Kansas
College of Physicians and Surgeons, Baltimore	(1914)		W. Virginia
Johns Hopkins Univ. School of Medicine (1932)	(1937, 2)		Maryland
University of Maryland School of Medicine and College of Physicians and Surgeons	(1936)		Maryland
Tufts College Medical School	(1911)		Maine
University of Minnesota Medical School	(1935)		Minnesota
Columbia Univ. College of Physicians and Surgeons	(1927)		Dist. Colum.
Long Island College Hospital	(1917)		New York
New York Univ. College of Med. (1935)			New York
Hahnemann Med. College and Hospital of Philadelphia (1939)			New Jersey
Jefferson Medical College of Philadelphia	(1925)		New Jersey
(1934) New York, (1936) N. Carolina, (1937) Delaware			
University of Pennsylvania School of Medicine	(1938)		N. Carolina
Medical College of the State of South Carolina	(1938)		S. Carolina
Meharry Medical College	(1939)		Tennessee
Univ. of Tennessee College of Med.	(1912), (1927), (1935)		Tennessee
Medical College of Virginia	(1915), (1933)		N. Carolina
Johann Wolfgang Goethe-Universität Medizinische Fakultät, Frankfurt-am-Main	(1931)		New York
Rheinische Friedrich-Wilhelms-Universität Medizinische Fakultät, Bonn	(1934)		New Jersey

School	LICENSED BY ENDORSEMENT	Year Grad.	Endorsement of
College of Medical Evangelists	(1940)		N. B. M. Ex.
George Washington University School of Medicine	(1938)		N. B. M. Ex.
Harvard Medical School	(1935)		N. B. M. Ex.
Duke University School of Medicine	(1937)		N. B. M. Ex.
Medical College of the State of South Carolina	(1916)		U. S. Navy
Medizinische Fakultät der Universität Wien	(1937)		N. B. M. Ex.

Wyoming October Report

Dr. M. C. Keith, secretary, Wyoming State Board of Medical Examiners, reports the written examination for medical licensure held at Cheyenne, Oct. 7-8, 1940. The examination covered 13 subjects and included 96 questions. An average of 75 per cent was required to pass. Ten candidates were examined, all of whom passed. Four physicians were licensed to practice medicine by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
The School of Medicine of the Division of the Biological Sciences	(1937)		82
University of Illinois College of Medicine	(1937)		86
State University of Iowa College of Medicine	(1938)		83
University of Kansas School of Medicine	(1934)		84
Wayne University College of Medicine	(1934)		82
University of Minnesota Medical School	(1935)		88
University of Nebraska College of Medicine (1937)	80, (1938)		75
Baylor University College of Medicine	(1939)		83
Osteopath *			82

School	LICENSED BY ENDORSEMENT	Year Grad.	Endorsement of
University of Louisville Medical Department	(1909)		N. Dakota
Creighton University School of Medicine			S. Dakota
University of Nebraska College of Medicine			Nebraska
University of Oregon Medical School	(1930)		B. M. Ex.

* Examined in surgery only.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Optometry Practice Acts: Availability of Injunction to Restrain Unlawful Practice.—The New Hampshire Board of Registration in Optometry filed a petition, in which it was joined by five individual optometrists as intervenors, for an injunction to restrain the defendants, the Scott Jewelry Company and one Boisvert, from engaging unlawfully in the practice of optometry. The jewelry company was not licensed to practice optometry but it hired at a weekly salary Boisvert, a licensed optometrist, to conduct its optometric business. By advertising and otherwise it held itself out to the public as possessing the means for examining eyes, for measuring the powers of vision and for adapting lenses to aid vision, and it deceitfully held out that Boisvert was practicing on his own account. The defendants demurred to the petition and the case was transferred to the Supreme Court of New Hampshire without a ruling.

The question determinative of this appeal was whether or not an injunction was available, in a case of this nature, to either the Board of Registration in Optometry or the individual optometrists as intervenors. It was conceded that a court of equity will not interfere by injunction, on motion of a public official, to prevent the violation of a criminal statute when the violation does not constitute a public nuisance or where the criminal remedy at law is adequate. In the judgment of the court the illegal practice of optometry is not a public nuisance. The court, therefore, could not agree with the plaintiff board's contention that a court of equity has authority to restrain the illegal practice of licensed callings even though such illegal practice is punishable as a crime. Such authority has not been recognized in New Hampshire, and the scope of a court's equitable jurisdiction cannot be enlarged merely for the convenience of the state, except in accord with well settled principles. In the opinion of the court the state had an adequate remedy at law. The penalty prescribed by the optometry practice act for the illegal practice of optometry is a fine of from \$50 to \$200, which is not trifling. Assuming Boisvert's guilt, conviction for two or more violations of the act, with imposition of the fine for one charge and continuance of the other charges for sentence, would seem to be as effective as a perpetual injunction. If it could be conceived that similar action against the defendant corporation would not have a similar effect, a more summary common-law remedy is at the command of the state by quo warranto proceedings to oust the corporation from the exercise of powers ultra vires. Also, if Boisvert is guilty, as charged, of fraud in the practice of optometry, his wrong-doing can be effectually ended by revocation of his certificate by the plaintiff board.

As to the equitable rights of the individual optometrists who intervened, continued the court, although the majority of cases hold that a license confers on a practitioner a franchise which is in the nature of a property interest and is such a right as may be protected by a court of equity, nevertheless an injunction to protect that right, in the absence of a specific statute, will be denied unless the practitioner shows irreparable injury, inadequacy of remedy by other proceedings at law or that the unlawful practice was a public nuisance injuring his franchise. The true test of the individual plaintiffs' rights, therefore, depends on the construction to be given to the New Hampshire optometry practice act. That act does not, as do some optometry practice acts, give to licensed practitioners of optometry authority to enforce the provisions of the act, even if such power could be construed as usable in protection of private rights of property as distinguished from public rights. Only the public can do so by means of its servant, the board of examiners. The legislature, in passing the act in question requiring licenses to practice optometry, evinced no intention of freeing licensed

optometrists from competition or to create a monopoly for their benefit. The sole apparent intention of the legislature was to benefit the public by freeing it from the practice of incompetents. Only public officials, the members of the board of examiners, are recognized by the act as the sole guardians of the rights contemplated. There is no room for supposing that exclusion, left in such control, was intended to be for the benefit of the competent licensees. The court concluded that the individual plaintiffs had no property right to noncompetition by unlicensed or unlawfully practicing persons. Accordingly, the defendants' demurrer was sustained and the injunction denied.—*New Hampshire Board of Registration in Optometry et al. v. Scott Jewelry Co. et al.*, 9 A. (2d) 513 (N. H., 1939).

Malpractice: Liability of Physician for Negligence of Intern and for Delay in Removing Broken Needle.—The defendant physician, on Jan. 24, 1936, performed a gallbladder operation on the plaintiff at a hospital in the District of Columbia. After the operation the defendant instructed an intern to administer to the plaintiff a hypodermoclysis, consisting of a saline and dextrose solution. The equipment and solution for the injection were furnished by the hospital and taken to the plaintiff's room by a nurse. There the intern proceeded to administer the hypodermoclysis while the plaintiff was still under the influence of the anesthetic. The defendant was not present in the room at the time. The evidence showed that the lights in the plaintiff's room had been dimmed and were not turned up during the injection. While the intern was inserting a needle in the region of the plaintiff's right armpit, the needle broke off at the hub, leaving a segment about 2 inches (5 cm.) long in the subcutaneous tissue. Several attempts by the intern, the resident physician and the defendant were made to retrieve the broken portion but without success, and so the defendant decided to allow the needle to remain temporarily in the plaintiff's side. The plaintiff was taken home from the hospital on February 10 and was more or less of an invalid until the early part of March. Between the date of the operation and March 7 the plaintiff frequently experienced pain in her right side but apparently did not advise the defendant of that fact. On March 7 the defendant for the first time told the plaintiff that through the carelessness of an intern a needle had been broken off in her side and that it should be removed. She immediately consulted another physician, who also advised that the needle be removed. She then returned to the defendant, who extracted the broken needle on March 9. However, she continued to have pain in her side and she consulted four other physicians. In a subsequent suit against the defendant for damages caused by his alleged malpractice, one of these four physicians testified: "I thought at first that she had a painful scar. But the further along I went, the more I believed it was not a painful scar, but more a worked-up case, psychological." None of the other physicians consulted testified. From a judgment for the defendant on a directed verdict, the plaintiff appealed to the United States Court of Appeals for the District of Columbia.

The plaintiff first contended that the defendant was liable for the negligence of the intern in attempting the injection in a darkened room. The Court of Appeals, however, held that the doctrine of respondeat superior was not applicable. The intern, in following out the instructions of the operating physician, was merely furnishing services on behalf of the hospital, his employer; he was not assisting the defendant in the conduct of the operation. There is authority, said the court, for the view that an operating physician is liable for the negligence of an intern or other hospital employee while actually assisting him in the operating room, but when the intern or other hospital employee is negligent in carrying out the operating physician's instructions as to postoperative treatment, the overwhelming weight of authority is that the operating physician is not liable in the absence of proof "that he was negligent in giving the instructions or selecting the persons to carry them out, that he was present and could have avoided the injury by exercising due care, or that his special contract relative to the negligent employee was such as to make the doctrine of respondeat superior applicable." In the present case the plaintiff failed to prove any of those essential facts.

The plaintiff also contended that the defendant was negligent in failing to remove the broken needle until more than six weeks had elapsed after it had been broken off in the plaintiff's side. But, said the court, the mere showing that the broken needle was allowed to remain in the plaintiff's side for such a period of time did not prove that the defendant was negligent. All the evidence indicated that the plaintiff was a highly nervous woman and that for almost the entire six week period she was physically and mentally unable to withstand the strain of another operation. The evidence also showed that the needle was lodged in fatty tissue where the danger of infection or movement to a zone of danger was slight. Furthermore, none of the plaintiff's expert witnesses testified that the defendant's conduct was contrary to the accepted practice among physicians in the District of Columbia. The court held, therefore, that in the light of such facts the delay of the defendant did not constitute negligence.

The court could not agree with the plaintiff's further contention that the doctrine of *res ipsa loquitur* applied and that therefore she was not required to show any more than that the needle was broken and that the broken portion was allowed to remain in her side for more than six weeks. That doctrine, said the court, applies only when the facts which the plaintiff proves are sufficient to sustain an inference of negligence, although evidence directly establishing the negligent act is not available. Here the evidence disclosed fully the nature of the acts alleged to be negligent and those acts present no reasonable basis for inferring negligence. Accordingly, the Court of Appeals affirmed the judgment for the defendant.—*Hohenthal v. Smith*, 114 F. (2d) 494 (1940).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

*Sulfanilylguanidine in Treatment of Acute Bacillary Dysentery in Children. E. K. Marshall Jr., A. C. Bratton, Lydia B. Edwards and Ethel Walker, Baltimore.—p. 94.

Sulfanilylguanidine for Bacillary Dysentery.—According to Marshall and his collaborators, experimental studies of sulfanilylguanidine suggest that it or some other compound having similar properties may prove useful in the treatment of bacterial infections of the intestine. The intestinal contents can be saturated with a dosage of the drug which gives a low concentration in the blood. Sulfanilylguanidine was used in the treatment of 17 children with acute bacillary dysentery from whose stools the dysentery organism was recovered. Treatment was usually begun within twenty-four hours of admission or as soon as the diagnosis of probable dysentery was made. Initial doses were either 0.1 or 0.2 Gm. per kilogram of body weight; maintenance doses varied from 0.1 Gm. every eight or twelve hours to 0.05 Gm. every four hours. Otherwise the management was the standard for gastrointestinal disorders. The results of treatment instituted early in the disease differed from those when treatment was begun later. Of 7 children treated on or before the third day of the disease the temperature within twenty-eight hours, and frequently much sooner, had fallen below 100.4 F. in every case and the children remained afebrile. Within twelve to thirty-six hours after the drug was started there was decided improvement in the general condition, some of the children appearing almost well after twenty-four hours of chemotherapy. The diarrhea was checked in from one to three days in all children given sulfanilylguanidine every four hours. Chemotherapy of the other 10 children was started within the fourth to the fourteenth day of the disease. The results were not uniform. Some of the children showed the same striking improvement that occurred in those treated early, but the course of most of them was uninfluenced by the sulfanilylguanidine. The stool cultures of 10 of the 17 children became negative for dysentery organisms during treatment and remained negative during hospitalization, of 5 others they became negative on the last day of therapy or within two days after its

discontinuance, 1 child had an inconstant positive culture (Sonne) during and after drug administration and 1 had a negative culture before treatment was started. In addition to the 17 cases of proved acute bacillary dysentery, 3 infants were treated with sulfanilylguanidine who were thought to have the disease but whose stools failed to yield the organism. A child of 14 months was treated on the first day of a clinically typical attack of acute dysentery and was dramatically cured in twenty-four hours. The 2 other infants, aged 5 and 8 months respectively, were treated on the third and fourth day of an acute gastroenteritis without beneficial effect. A variety of *Salmonella enteritidis* was cultured from the stools of 1 and the *Morgan bacillus* and later a variety of *Salmonella enteritidis* from the stools of the other child. No definite toxic effects have been observed. With one exception none of the children received the drug for more than fourteen days, the fluid intake was always adequate and a careful watch was kept for any evidence of renal insufficiency. The authors recommend the following dosage program for further trial of sulfanilylguanidine in acute bacillary dysentery in children: initial dose by mouth 0.1 Gm. per kilogram, maintenance dose 0.05 Gm. every four hours until the daily number of stools is four or less, then 0.1 Gm. every eight hours for at least three days. The finely powdered drug is mixed in milk or in water. In adults the dosage schedule for bacillary dysentery has been the same as for children except that when the drug is given every eight hours 0.05 Gm. per kilogram is given instead of 0.1 Gm.

Anuria Following Sulfapyridine Therapy.—Dourmashkin and Worton discuss clinical manifestations of concretions in the urinary tract following sulfapyridine therapy. Experimental and clinical data in the literature and the experience in their own case of anuria due to complete impaction of the ureters with sulfapyridine concretions point definitely to the fact that hematuria is not a manifestation of toxic nephritis induced by the drug but the result of local tissue laceration and that it may originate anywhere in the urinary tract. The degree of urinary stasis may depend on the local ability of the urinary tract to get rid of accumulated concretions. Other clinical manifestations are those of ureteral obstruction and may vary from slight unilateral or bilateral costovertebral pain to a typical colic with all its accompanying symptoms: nausea, vomiting and general prostration. In the latter the retention of urine above the site of ureteral obstruction is, as a rule, complete. Complete retention may be associated with little or no pain. In the case reported the pain was more predominant

on the right side, although the obstruction was more obvious on the left side. In the authors' case of complete anuria only 6.5 Gm. of the drug had been administered during two days. Schiffrin's patient received as much as 246 Gm. of the drug during sixty-three days without apparent interference with urinary drainage, although at necropsy both renal pelves and all calices were filled with mushy, gritty acetylsulfapyridine concretions. This patient, until death, passed large daily amounts of urine. She had, however, a continuous distinct hematuria. The absence of renal enlargement and hydro-nephrosis at necropsy pointed to the fact that the patient's ureters, which were found to be somewhat dilated, were particularly patent. Therefore even small doses may produce complete anuria if the condition of the urinary tract favors the retention of crystalline deposits. Oliguria undoubtedly indicates an incomplete bilateral obstruction and should call for cystoscopic drainage when it cannot be relieved by large amounts of fluid by mouth and intravenous injections of dextrose. Oliguria, as a rule, precedes anuria. The recognition of its mechanical nature is extremely important, as timely cystoscopy may be life saving. Anuria may be produced by massive deposition of crystals in the collecting tubules, and in such an event cystoscopy obviously cannot reestablish renal drainage. Bilateral ureteral catheterization reestablished renal drainage in the authors' patient, with complete recovery. Immediately after ureteral catheterization pain in the right kidney disappeared. Indwelling catheters were allowed to remain in both ureters for twenty-four hours, and during this time 34 ounces (1,020 cc.) of urine was obtained from the right kidney and 30 ounces (900 cc.) from the left, in addition to a few ounces voided voluntarily. The catheters were washed whenever drainage slowed up.

Cerebral Cholesteatoma: Case. I. R. S. Gordon.—p. 51.

Nutrition and Dental Caries in London Children.—Allen studied the effect of nutrition on the dental caries of 120 children from 5 to 7 years of age. The average caries figures and the nutrition indexes were calculated at the first inspection and again at the end of one year. There was a fairly high negative correlation at the age of 5 between the increase in the average caries figure and the increase in the nutrition figure; that is, the greater the increase in the nutrition index (indicative of improvement in nutrition) the less the increase in caries. At 6 years of age the same relation existed. At 7 years no correlation was found between the two conditions, but this group is not so satisfactory because many of the deciduous teeth were already normally shed. No association existed between the amount of caries found at the first inspection and that at the second inspection except that the onset and spread of caries tended to be less when the nutrition was better. Studies in animals show that good dental structure can be produced by dietary methods, and the same is true for children. Postoperative influences, though less strong, appear to provide secondary protection. Vitamin additions to the diet before eruption of the teeth had a definitely beneficial effect in reducing the amount of decay which developed, and also even after full eruption the additions tended to delay the onset and spread of caries in the permanent teeth. Among the 120 elementary school children the lower incisors and canines showed the best surface structure and the molars the worst, the upper incisors and canines being intermediate; the structurally soundest teeth were those of which the greatest part is formed in utero before dietary deficiencies are normally felt by the child. There was a definite association between the quality of the structure of the teeth and the amount of caries present: the better the structure, the greater the resistance to dental disease. An improvement in physical condition as judged by better nutrition index at 5 and 6 years of age was associated with a smaller increase in dental caries.

Optimal Calcium Requirement.—Harris and his associates present studies which indicate that levels of serum calcium should not be utilized as criteria of adequate calcium intakes, as serum calcium appears to be independent of the intake. Calcium determinations of 51 random patients showed that only 4 had levels below 9 mg. per hundred cubic centimeters; from 9 to 11.5 mg. is considered normal for adults. The authors put patients on high and low calcium intake for fourteen days. Between the two periods they were kept for some time on a normal diet. From this investigation and a prolonged search for calcium deficiency in an extensive hospital practice they say that, apart from osteomalacia, which in any case is very rare, an ultimate balance is established between calcium intake and output. Sir John Orr says that in half of the population of the country the calcium intake is below that required. On a high calcium intake there is retention of the substance. The authors state that this piling up of calcium cannot continue indefinitely or a hypercalcemia will result. They point out that there is no evidence which suggests that the majority of the population is suffering from the effects of calcium insufficiency but that large sections of the population are in the habit of using too much food rich in calcium. They conclude that there may be an indication for reducing the food calcium but there is none for increasing it. According to Sir John Orr, in half the population the calcium intake

is satisfactory, and this half the authors say will be suffering from the effects of hypercalcemia if the calcium content of the diet of the country is raised.

*Two Methods for Detection of Influenza Virus in Human Throat Washings Without Use of Ferrets. F. M. Burnet and M. Foley.—p. 68. The Medical Industrial Efficiency Department. H. L. Kesteven.—p. 72. Cultivation of β -Hemolytic Streptococci on Maltose-Blood-Agar: Presumptive Test for Group A. R. T. Simmons and H. Wilson.—p. 74. Brose-Jones Test for Cancer. J. B. Thiersch and S. Schlosser.—p. 77.

Detection of Influenza Virus in Human Throat Washings.—Burnet and Foley find that influenza virus can be isolated and identified from filtrates of human throat washings by amniotic inoculation into chick embryos. To obtain the filtrate the patient is given 10 cc. of saline solution and after thorough gargling the fluid is mixed with 5 cc. of nutrient broth and sent to the laboratory as quickly as possible. It is then filtered through sterile filter paper to remove mucus and debris, and this filtrate is used for mouse inoculation and for further filtration through a gradocol membrane with an average pore diameter of about 0.8 micron. The membrane filtrate is tested for sterility and used for egg or ferret inoculations. With the primary paper filtrates the authors usually inject about 0.25 cc. into the amniotic cavity of chick embryos of 12 days and make an examination after four days of further incubation. Definite changes in the tracheal fluid and in the macroscopic appearance of the lungs were observed in the entire primary series of embryos. Pooled amniotic and allantoic fluids were collected from all eggs as they were opened, and passages were made with those from embryos showing typical lesions. Mice were inoculated intranasally under light anesthesia with 0.05 cc. of fluid, the inoculum being delivered from a calibrated capillary pipet. Those receiving the primary paper filtrates were reinoculated fourteen days later with 1:100 dilution of stock Melbourne mouse virus, equivalent to about one hundred minimal lethal doses. The survivors were examined seven days later for the extent of pulmonary lesions. Inoculations of egg material were usually of pooled embryonic fluids diluted 1:5 or 1:10. The mice were bled for serum or given a test inoculation of active virus fourteen days later. Serum titrations were made both by chorioallantoic and by mouse methods. Standard technics and the Melbourne egg or mouse strains of virus were used. Isolation of the virus from material which was noninfective to ferrets provides a particularly definite indication of the value of the amniotic method. This and the ease with which all types of mouse, ferret or chorioallantoic strains can be propagated seems to justify the statement that the amniotic method is the method for isolating influenza virus. Primary infections of the chick embryo are easily recognized by examining tracheal smears. Repeated passage is not required before lesions are visible, as is necessary with chorioallantoic inoculations. A further advantage is that three or four days after the primary inoculation each egg provides from 5 to 10 cc. of high titer infective material free from bacteria for further work. The authors have had insufficient experience to discuss the readiness with which mouse strains can be developed from amniotic material. Primary amniotic fluids nearly always gave small pulmonary lesions in mice. They have carried out only one series of mouse passages of a strain isolated by the amniotic method. The strain Rich. was transferred to mice after three amniotic passages. Definite lesions were produced; but in the next passage of ground mouse lung the lesions were smaller, with the third mouse passage they were larger and in two more passages mice were dying in five days when inoculated with undiluted virus emulsion. Unless the strain is exceptional, there should be no difficulty in establishing mouse strains from primary amniotic isolations. The inoculation of paper filtrates of throat washings in mice is likely to be useful only when makeshifts must be employed; e. g., to show that an epidemic in some isolated community was due to influenza virus. The amniotic method, the authors believe, will provide all the information ordinarily necessary to characterize a strain of influenza virus.

*Clinical Aspects of Sclerosis of Pulmonary Artery. K. Hohenner.—p. 293.

Cardiopneumatic Movement, Its Form, Its Nature and Its Behavior in Low Pressure Region. E. M. Müller and H. O. Wachsmuth.—p. 325. Experimental Investigations on Action of Epinephrine on Myocardium. G. Veith.—p. 335.

Electrocardiographic and Anatomic Investigations on Rabbits Regarding Action of Insulin Shock and of Metrazol Convulsions on Heart. H. Meessen.—p. 361.

Sclerosis of Pulmonary Artery.—According to Hohenner, Romberg in 1891 described a case in which severe cyanosis was the chief symptom and which had been clinically diagnosed as a congenital cardiac defect and in which necropsy revealed sclerotic changes in the pulmonary artery. Descriptions of similar cases followed, but as late as 1919 it was believed that the diagnosis of sclerosis of the pulmonary artery is possible only at necropsy. Ayerza, a South American, described in 1901 this disorder under the term "cardiaco negro," and in later years the term "Ayerza's disease" found wide application. There are two forms of sclerosis of the pulmonary artery, the "primary" and the "secondary." The secondary form occurs as a sequel to increased pressure in the pulmonary artery in such conditions as congenital cardiac defect, in lesions of the mitral valve and in pulmonary emphysema. The author reports 11 cases of the primary and 3 of the secondary form. The first patient with secondary sclerosis had no pulmonary or cardiac complaints, but roentgenoscopy disclosed the existence of sclerosis of the pulmonary artery. The second patient presented symptoms of pulmonary emphysema, chronic bronchitis and bronchiectasis. Cyanosis together with pulmonary and hepatic stasis pointed to myocardial insufficiency. The diagnosis of sclerosis of the pulmonary artery was again made possible by roentgenoscopy. Dilatation of the pulmonary artery was revealed by a widening of the shadows of the hilus vessels. This symptom was not detectable during the stage of decompensation on account of the simultaneously existing pulmonary stasis. It became demonstrable after compensation had been established. The same roentgenologic sign led to the diagnosis of "secondary" sclerosis of the pulmonary artery in the third case. The author emphasizes that in the "secondary" form sclerosis of the pulmonary artery never exerts a noticeable influence on the underlying disorder. It is only a partial manifestation of a sclerosis of the entire circulation. Clubbed fingers are usually absent in this form. "Primary" sclerosis of the pulmonary artery is an independent disease entity. It is now often referred to as the arteriogenic form because stenosis of the arterioles is its most essential aspect, sclerosis of the trunk and main branches being secondary to this. The author presents detailed histories of 8 cases of "primary" (arteriogenic) sclerosis of the pulmonary artery. Arteriogenic pulmonary sclerosis is a chronic disorder. The first stage is often characterized by chronic bronchitis and frequent catarrhs. During this stage the correct diagnosis is difficult, many patients not presenting themselves for treatment until circulatory failure results. During this second stage the disease takes on the aspect of a cardiac disorder. The hypertrophy of the right side of the heart, the cyanosis and the accentuated second pulmonary sound may simulate a mitral valve lesion, particularly in the stage of adequate compensation. A decompensated heart, mild dyspnea, and severe cyanosis suggest pulmonary artery sclerosis. More definite recognition is possible by roentgenologic demonstration of calcium in the wall of the main branches of the pulmonary artery and by the detection of calcified thrombi within it. The author observed a sign which permits the differentiation of sclerosis of the pulmonary artery from simple pulmonary stasis in the sagittal exposure. In pulmonary stasis all, even the smallest, ramifications of the pulmonary artery are dilated, whereas in sclerosis of the pulmonary artery the peripheral vessels are extremely narrow in contrast to the greatly dilated main branches. Although some investigators assume a syphilitic origin for sclerosis of the pulmonary artery, the author rejects this cause in his patients because the Wassermann reaction was negative and there were no other syphilitic changes. Most histories disclosed infectious disease. The prognosis of this condition is unfavorable. Causal therapy is not possible. Hochrein and his collaborators have suggested a new therapeutic possibility by pointing out that

in sclerosis of the pulmonary artery, as well as in chronic emphysema, there exists a deficient blood perfusion of the peripheral pulmonary artery. Clinical experience and tests on animals show that blood perfusion can be improved by pharmacologic stimulation of the vagus, by respiration under negative pressure and by respiratory gymnastics.

*Pathogenesis and Clinical Types of Pneumonia in Infants and Children. I. Ishida.—p. 113.

Pneumonia in Infants and Children.—Ishida approaches the study of pneumonia in infants and children from the standpoint of individual reaction to the infecting agent. Owing to the absence of immune bodies, the newly born infant may be regarded as virgin soil for pneumonic infection. Hence the invasion of the etiologic micro-organisms produces a severe bacteremia systemically, while relatively little local reactions occur because of the lack of any allergic tendency. The newly born infant is protected against certain infections by transplacental immunity and gradually establishes its own immunity, which may then be called the process of normergy. The pneumococcal infection in such infants manifests itself in the form of bronchopneumonia. In older children this type of pneumonia may occur as a primary type, especially when pneumonic infection follows other diseases, such as measles and pertussis, which act as predisposing causes of anergy. With the increasing degree of immunity the infection manifests itself as a localized process but nevertheless it is still combined with the primitive form, which may be called an intermediary type. The hyperergic type of pneumonia is seen in the relatively mature child with a well developed immunity, in which the infection occurs as a severe local process with relatively mild systemic manifestations. This lobar pneumonia may be associated with focal infections in other parts of the lung, such as in the periphery (marginal pneumonia) or the hilus (hilar pneumonia). From an analysis of 195 cases of pneumonia in infants and children, including roentgenographic studies, Ishida offers the following classification based on the foregoing conception: 1. Allergic pneumonia (bronchopneumonia): (a) disseminated pneumonia, (b) hilifugal-perivascular-bronchial pneumonia, (c) confluent focal pneumonia. 2. Hyperergic pneumonia (lobar pneumonia): (a) marginal-focal pneumonia, (b) hilar pneumonia, (c) croupous pneumonia. 3. Hyperergic pneumonia: (a) hilifugal-infiltrating pneumonia, (b) marginal-progressive-infiltrating pneumonia, (c) wandering pneumonia, (d) abortive pneumonia. The author attempted a statistical study as to the distribution of various types according to age, seasons, febrile course, nature of lysis or crisis, and mortality. The analysis of roentgenograms of these patients is summarized as follows: Anergic forms of pneumonia are associated with severe systemic manifestations with poor prognosis and widely disseminated pneumonic changes in the lungs, although the individual foci of infection may be relatively mild. In cases of hyperergic pneumonia, the systemic manifestations are usually mild but characterized by severe localized reactions, frequently limited in one lobe. In the hyperergic forms, the pulmonary pathologic conditions again become diffuse and disseminated, but never as extensive as in bronchopneumonia and often confined to one side. Although systemic reactions are moderately severe, the prognosis as a rule is good. In cases of positive anergy there may be no actual infection in the lungs; but with mild systemic manifestations localized indeterminate lesions may be demonstrated by roentgenographic examination (abortive pneumonia). Pneumonic infection in infants under 3 months of age manifests itself in any of the three forms: (1) mild bronchopneumonia, as influenced by the presence of maternal immunity, (2) severe bronchopneumonia resulting from negative anergy, due to some unknown constitutional factors, and (3) anergic lobar pneumonia. The opinion is expressed that pneumonia in infants and children is not explainable merely on the basis of the season, the etiologic agent or the age; these are important, but they constitute only the predisposing cause. The real explanation lies in the nature of the reactive stage in which the individual patient happens to be situated.

Book Notices

The Pharmacological Basis of Therapeutics: A Textbook of Pharmacology, Toxicology and Therapeutics for Physicians and Medical Students. By Louis Goodman, M.A., M.D., Assistant Professor of Pharmacology and Toxicology, Yale University School of Medicine, New Haven, and Alfred Gilman, Ph.D., Assistant Professor of Pharmacology and Toxicology, Yale University School of Medicine. Cloth. Price, \$12.50. Pp. 1,333, with 126 illustrations. New York: Macmillan Company, 1941.

Among the various new books on pharmacology and therapeutics which have been published in recent years this volume is noteworthy, and it will fill the much felt need for an up to date source of information and student textbook. It is based on the modern literature and gives special attention to the evidence relating to controversial points, and this has resulted in a stimulating presentation which has the quality of freshness. In this respect the book contrasts with the older textbooks in general use, which are prone to carry much material through many editions without rewriting.

The underlying physiology is briefly presented and the drugs are grouped, where feasible, according to the system with which their actions are most prominently associated, and all aspects of each drug are, with a few exceptions, considered in a single section. In certain instances, as with the heavy metals and vitamins, the authors have, as is customary, resorted to a chemical grouping. Newer compounds having therapeutic application are well covered, and this aspect gives the book an almost unique place as a reference work. Thus the sulfonamide compounds alone occupy one hundred pages, and there is a section on the war gases. In keeping with the current breadth of pharmacologic teaching, attention is given to hormones and vitamins. The book opens with an interesting review on general principles and closes with a chapter on the writing of prescriptions. An adequate selection of the more important references is printed at the end of each section and includes a useful list of monographs and reviews.

In the preface the authors state that the emphasis throughout has been clinical; accordingly, full use has been made of the evidence derived from human pharmacology in health and disease. However, this has been done without neglecting the fundamental aspects derived from laboratory investigations. Less emphasis has been placed on the relationship between chemical structure and biologic activity, but on the whole the treatment is adequate. To the pharmacologist it will require some readjustment of thought to accept the relegation of such classic drugs as camphor, muscarine and curare to a secondary position—a brief exposition in small type. The preparation of such a book is an enormous undertaking and it is not to be expected that the choice of material could meet the views of every one; the reviewer would for example like to see an account of the recent advances in our knowledge of the active principle of marihuana and some reference to the action of this drug on animals. The statement that "gold salts are now seldom used clinically" is hardly justified in view of the present interest in the use of gold salts in the therapy of arthritis, and a more extended treatment would be useful.

It is to be hoped that the large size and high cost of the volume will not discourage its use as a student textbook. It will find wide use in those institutions where pharmacology is given a place commensurate with its present day importance in the medical curriculum.

Contributions to Embryology. Volume XXVIII, Nos. 170 to 178. Carnegie Institution of Washington Publication No. 518. Paper. Price, \$4. Pp. 451, with illustrations. Washington, D. C., 1940.

The current volume of the *Contributions to Embryology*, which was unfortunately delayed in publication, contains a wealth of valuable material for students of reproduction and development. A. H. Schultz reports a study of growth and skeletal changes in more than a hundred chimpanzees from the late fetal to the mature stages. E. H. Boyden's painstaking analysis of a ten and twelve somite human embryo leads to valuable quantitative conclusions with regard to the relative volumes of different portions of the embryo at this time and to the enormous rapidity with which growth changes occur. Other interesting studies are those of Long on the in vitro growth of ovarian germinal epithelium, Fitzgerald on the bilaterally symmetrical defects of

the cerebral cortex in a human infant, and Cuajunco on the development of neuromuscular spindles in human fetuses.

The monographs of Hines and Boynton and of Markee will undoubtedly become classic contributions to their respective fields. Hines and Boynton have in comprehensive fashion studied the maturation of "excitability" in the precentral gyrus of the rhesus monkey in specimens ranging from sixty-six days' gestation to one year of life. They discriminate between idiokinetic responses to stimulation, which approach those elicitable from homologous points in the adult motor cortex, and holokinetic responses which lack discreteness or topographic localization. Holokinetic responses are the only movements obtained in fetuses of sixty-six to one hundred and twenty-five days' gestation. From one hundred and thirty-five days' gestation age to the end of the first year of life there is a gradual replacement of holokinetic and silent points by idiokinetic points, which represent the adult type of topographic projection. The paper of J. E. Markee will be of singular interest to gynecologists as well as to all those workers who have dealt with the mechanism of menstruation. Markee has studied the changes in bits of endometrium transplanted to the eye of the rhesus monkey for more than four hundred and thirty-two menstrual cycles. In addition to data as to growth changes, he contributes a detailed account of the events that precede and accompany menstruation. Some of the high lights of his study are as follows: All menstrual flows are preceded by periods of regression, in which the size of the transplant may decrease by more than half. A slow regression without menstrual bleeding may terminate some cycles of growth. The mechanism is the same in anovulatory as in ovulatory cycles. Crystalline estrogen inserted into the anterior chamber before an expected flow may prevent bleeding from the transplant, although it occurs from the uterus. This and other experiments indicate that the mechanism of menstruation is essentially a local one involving the vascular bed, particularly the coiled arteries. Markee proposes a purely physical theory of menstruation based on the increased coiling of the arteries brought about by regression. His paper represents a fundamental contribution to the body of knowledge which will have to be acquired before any rational control of different types of uterine bleeding becomes possible.

Blood Pressure Study, 1939. Compiled and Published by the Actuarial Society of America and the Association of Life Insurance Medical Directors, New York. Cloth. Pp. 69. New York, 1940.

This report covers the period 1925-1937. It follows a similar report entitled *Blood Pressure*, which appeared in 1925. A classification of the data is followed by tables of correlations between expected deaths and recorded illness. The customary correlation between high blood pressure and most illnesses is noted. Suicide, however, shows a reverse correlation. It is persons with low blood pressure who commit suicide most frequently. This is stated to be new and is worthy of more detailed report as follows: It was found that fairly high systolic pressure (143 to 177) with low diastolic (54 to 83) give the lowest suicide ratio, i. e. 75 per cent of the expected rate. Evidently a fairly high blood pressure is good for something. It is best in this regard when the diastolic pressure is low. This association of low systolic pressures with increased suicide rates increases with the rise of the diastolic and a decrease of pulse pressure. A combination of low systolic with high diastolic pressure is therefore the worst of all with reference to suicide. The ratio for suicide for this group is 72 per cent worse than the most favorable blood pressure status cited, i. e. the high systolic-low diastolic group. This correlation of suicide with low systolic pressure does not add validity to recently current opinions that low systolic blood pressures are "normal," "ideal," "a fortunate occurrence." This present opinion of low blood pressure is perhaps a salutary but somewhat too ample reaction against the former general opinion that low blood pressure was a "disease" and must be treated. The report reflects the most common and serious deficiency in blood pressure methods and statistics, i. e. the failure to record the standing and horizontal blood pressure. The difference between the two, which may be as great as 50 to 100 mm., is therefore not noted. This difference, "orthostatic hypotension," has an increasing claim to clinical and statistical notice. It might explain the suicide ratio. Large scale statistical

data such as the life insurance companies might gather on this point would be welcomed. Otherwise the value of this publication is documentary rather than clinical.

Surgical Anatomy of the Head and Neck. By John Finch Barnhill, M.D., F.A.C.S., LL.D., and William J. Mellinger, M.D., Associate Professor of Anatomy, University of Southern California School of Medicine, Los Angeles. Introduction by Paul S. McKibben, Professor of Anatomy in the School of Medicine, University of Southern California. Second edition. Cloth. Price, \$15. Pp. 773, with 431 illustrations. Baltimore: William Wood & Company, 1940.

This work, while useful for ophthalmologists, head surgeons and others, is primarily intended for the nose and throat specialist. The illustrations are chiefly anatomic in character. The material discussed is immensely varied and detailed. To obtain a similar review of the area covered would require numerous textbooks and a great expenditure of time and energy. A welcome addition to the library of the otolaryngologist, this work is in line with all those efforts of the specialty to improve itself in the last quarter century. It is an expression of the same foresight and energy which produced the American Board of Otolaryngology, made the Academy of Ophthalmology and Otolaryngology the great force for good which it is, and called into being the important postgraduate courses in the ear, nose and throat at various of our best medical schools. Its virtues, if anything, have increased in this edition. Its defects, if it has any, are of minor importance. It can be read from cover to cover, in or out of the dissecting room; it can be opened at almost any place for a few minutes browsing or consulted for some special anatomic point or surgical or anesthetic procedure, and for all of these this single volume can be fairly said to be without peer.

The Attractive Child: The Care and Development of Your Child's Beauty. By Constance J. Foster. Foreword by Angelo Patri. Cloth. Price, \$2.75. Pp. 338. New York: Julian Messner, Inc., 1941.

This is a book about health disguised as a book about beauty. The book is in three parts, of which the first, entitled "Handsome Is as Mother Does," contains chapters on good looks from various points of view. In this section the emphasis on beauty is somewhat overdone, especially in the opening paragraphs when the old proverb "Handsome is as handsome does" is designated a "hoary old chestnut." Nevertheless there are plenty of useful hints and a great deal of valuable information in these chapters, even though the meticulous reviewer might find some grounds for criticizing certain statements.

Section two, entitled "The Doctor Says!" deals with eyes, ears, teeth, skin, foot health, allergy, immunizations, endocrine glands and chemotherapy. This is a concisely written and sufficiently comprehensive treatment of these topics for the information of the parents who will most probably use this book.

Section three, entitled "New Departures," contains chapters on posture and body mechanics, growth, nervous tics, stuttering, the child's popularity, cultivating a pleasant voice, reconstructive surgery, the handicapped child, and a closing chapter indicating that no matter how valuable the contents of the "package" it probably will not make much appeal to the observer unless it is attractively "dressed."

One of the best chapters in the book is that entitled "Do People Like Your Child?" This chapter goes far to suggest that the rejection of the "Handsome is as handsome does" theory in the first chapter was not as total as it appeared.

This is a book that grows on the reader. The first impression, perhaps because of the great emphasis on beauty, is less favorable than is the estimate of the book as a whole when it has been carefully read through and evaluated.

Human Nature in the Light of Psychopathology. By Kurt Goldstein. The William James Lectures Delivered at Harvard University 1937-1938. Cloth. Price, \$2.50. Pp. 258. Cambridge: Harvard University Press; London: Oxford University Press, 1940.

This work is a modified and shorter version of the author's point of view previously published in English under the title of *The Organism*. Goldstein is essentially a psychologist of the gestalt school who has utilized the clinical material of organic brain lesions, especially those produced by war wounds. Like many other investigators, Goldstein finds that abstract behaviors which constitute the highest capacity of the human mind are first affected in brain lesions, especially those of the frontal lobes. Anxiety is a reaction to inner catastrophe and

forces the individual to make other use of his existing or remaining capacities. The author rejects the concept of inner drives or forces and correspondingly unconscious dynamic forces and childhood genesis to contemporary conflicts. In refuting psychoanalysis the author quotes Karen Horney, who has long since shown her own misconceptions of dynamic psychology. After the denial of drives, Goldstein is forced to postulate "that the only drive or basic tendency of the organism is to actualize itself according to its potentialities in the highest possible degree." The only conclusion open to the reviewer is that Goldstein is a "neobehaviorist" whose confused mixture of analytic methods and holistic concepts lead him into a philosophy which he extends from the individual to social phenomena. The work, however is interesting.

Recent Advances in Endocrinology. By A. T. Cameron, M.A., D.Sc., F.I.C., Professor of Biochemistry, Faculty of Medicine, University of Manitoba, Winnipeg. Fourth edition. Cloth. Price, \$5. Pp. 432, with 67 illustrations. Philadelphia: Blakiston Company, 1940.

There is no reason to criticize the author for an important defect in this book, since it is manifestly impossible for any one person to survey adequately the literature covering three years of intensive investigation in the field. The material included is sound, attractively presented and judiciously evaluated. Nevertheless it is not a complete review, a fact which the author acknowledges in the preface to the fourth edition. The last chapter, on endocrine interrelationships, is especially inadequate, since it largely disregards the many developments of the past five years in what has come to be designated psychosomatic relations or psychobiology. The bibliography for the chapter on the parathyroid glands should be revised more completely, as it apparently contains many items no longer referred to in the text. The book is less extensive than the third edition by nearly thirty pages but in general follows the same style and arrangement.

The Endocrine Function of Iodine. By William Thomas Salter, Assistant Professor of Medicine, Harvard Medical School, Boston. Cloth. Price, \$3.50. Pp. 351, with 40 illustrations. Cambridge: Harvard University Press; London: Oxford University Press, 1940.

The author of this monograph presents the endocrine function of iodine authoritatively. In addition to the role of free iodine and iodine-containing compounds, the relationship of the various glands of internal secretion to the thyroid gland from the point of view of fundamental biochemistry and physiology is discussed. The book contains some of the most recent contributions to our knowledge of iodine as obtained by using radioactive iodine. The physician will be especially interested in the chapter on clinical problems, in which are included representative case histories and the common problems of diagnosis and therapeutics. Another chapter of special interest to the physician is the one on the relationship between the thyroid and the nervous system. The appendix describes in detail the various technical procedures for the analysis of iodine and iodine compounds in various fluids and tissues. This appendix is a useful reference for the laboratory technician.

Nineteenth Hospital Yearbook. 1941 Hospital Purchasing File: Directory of Products, Manufacturers' Catalogs, Remodeling and Other Reference Data. Boards. Price, \$2.50. Pp. 1,028, with illustrations. Chicago: Modern Hospital Publishing Company, Inc., 1941.

This issue contains the usual advertising and listing of all types of supplies and furnishings used by hospitals. This department should be of assistance to purchasers. In addition, there is a selection of contributed articles by leading hospital administrators. They begin with the fundamentals of hospital service by Dr. S. S. Goldwater. Among the other subjects ably discussed are hospital organization, architecture, operating suite and other departments, tuberculosis units, modernization, air conditioning and lighting.

Syphilis in Earlier Days. By J. R. Whitwell, M.B. Cloth. Price, 5s. Pp. 89. London: H. K. Lewis & Co., Ltd., 1940.

The author's thesis is an attempt to disprove the theory that syphilis is a disease of the New World, brought back to Europe by Columbus's men. Evidence is brought forth that syphilis existed in France, Spain, Naples and elsewhere before Columbus returned from his voyage. The evidence is based on a description of the disease by writers of various ages under different names. The author shows that nearly every country considered syphilis a disease that was transported from somewhere else.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

CHEMOTHERAPY OF PNEUMONIA

To the Editor:—We are at present having some severe cases of pneumonia in this territory. We should be glad to have your opinion with regard to the use of sulfapyridine in severe cases and those which are complicated with meningitis, infections of the blood stream and bacterial endocarditis. Drs. Herrell and Brown, of Rochester, Minn., reported a number of cases of septicemia in which treatment was with large doses of sulfapyridine, bringing the level in the blood up to 12, 16 and 20 mg. per hundred cubic centimeters, with reduced mortality in this disease. We have attempted to raise the level of sulfapyridine in the blood in the treatment of our patients with severe pneumonia. Furthermore, in connection with the treatment with sulfapyridine we give continuously a high concentration of oxygen. It appears that we are able to give larger doses with a high level of sulfapyridine in the blood without severe toxic effects when a high concentration of oxygen is administered. But our few cases are not enough to justify an opinion of the effect of oxygen on the toxic effect of sulfapyridine so that we can give larger doses. However, I am anxious to learn whether some one else has used oxygen in connection with sulfapyridine with any degree of success in overcoming the toxic effects of sulfapyridine. 1. Do you think that sulfapyridine in large doses will lower the oxygen saturation of the blood? 2. If so, do you believe that inhalation of a high concentration of oxygen will raise the oxygen saturation of the blood if the saturation has been reduced by medication with sulfapyridine? 3. In a death caused by a poisonous dose of sulfapyridine, what do you think might be the direct cause of death? 4. Do you recommend in some cases giving sulfapyridine intravenously in physiologic solution of sodium chloride or dextrose solution? If so, give method of administration. 5. Is there a preparation of sulfapyridine which may be given intramuscularly? Our patients with minor pneumonia here get along all right with a level of sulfapyridine in the blood of between 4 and 6 mg., which has been recommended, but we have had some with severe pneumonia in whom the level was not effective.

T. A. Taylor, M.D., Lufkin, Texas.

ANSWER.—To answer the query satisfactorily, information as to the cause of the cases of severe pneumonia should have been given. In pneumococcic pneumonia sulfapyridine or sulfathiazole is used; for pneumonia caused by hemolytic streptococci, sulfanilamide is the drug of choice; for staphylococcic pneumonia sulfathiazole, and for pneumonia not caused by these bacteria chemotherapy is often ineffective.

In the case of complications of meningitis, septicemia or endocarditis occurring in pneumonia, evidence shows that high levels of the appropriate drug are desirable to favor recovery. The statement that a high concentration of oxygen permits larger doses of the sulfonamides to be given more safely is of interest and should be further investigated, since other studies on this point have not been noted. Most clinicians using chemotherapy for pneumonia also give oxygen when it is indicated for cyanosis and dyspnea but not necessarily with regard to overcoming specifically the toxic effects of the drug.

In answer to the specific questions asked:

1. Sulfonamides in large doses do lower the oxygen saturation of the blood.
2. Administration of oxygen will raise the oxygen saturation of that portion of the hemoglobin not already influenced by the drugs.
3. The chief causes of death from poisoning with sulfapyridine are (a) the syndrome associated with a sudden diminution in the number of leukocytes, (b) renal failure and (c) hepatitis.
4. This question is answered in detail in the paper referred to in the query. In certain cases in which the drug cannot be given by mouth, when there is difficulty in raising the level in the blood to the proper amount or if it is desirable to raise the level in the blood quickly, the soluble sodium salt of sulfapyridine may be injected intravenously. After the proper dose (0.06 Gm. per kilogram of body weight) has been calculated, a 5 per cent solution of sodium sulfapyridine in distilled water may be injected intravenously at the rate of 5 cc. a minute. Five Gm. may be given in a single dose. Additional doses may be given at intervals of six to eight hours to maintain the desired amount in the blood. Distilled water as a solvent is said to be preferable to physiologic solution of sodium chloride or dextrose solution.

5. Although many advise against the intramuscular injection of sodium sulfapyridine, it has been safely given either subcutaneously or intramuscularly in 0.3 to 0.7 per cent solution in physiologic solution of sodium chloride. Doses of 200 cc. may be given every six hours.

One wonders what is meant by patients with "minor pneumonia." In the past few years there have occurred many cases

of a mild form of pneumonia not caused by bacteria and apparently caused by filtrable viruses. Chemotherapy has no value in such cases and should not be used. The rate of mortality is negligible. Chemotherapy should not be applied to every patient who has fever and evidence of pulmonary involvement, since it is known to be of value only in pneumonias caused by pneumococci, hemolytic streptococci and perhaps staphylococci.

CENTRAL NERVOUS SYSTEM SYPHILIS

To the Editor:—A man aged 46, an assistant superintendent, came under my care on Nov. 4, 1938. He complained of "feet going to sleep," absent mindedness, nervousness and occipital headache. He presented unequal pupils and absent knee jerks. A Wassermann test revealed a 4 plus reaction. He received continuous treatment at weekly intervals of fourteen bismuth salicylate (1 cc.) injections. This was followed by nine neosarsphenamine treatments of 0.6 Gm. The Wassermann test of the blood again showed 4 plus. This was in March 1939. The spinal fluid report in March 1939 revealed globulin 1 plus, spinal fluid Wassermann reaction 4 plus, colloidal gold test 5555543210. He was given at weekly intervals twenty-six trypanamide injections of 3 Gm. each. This course was followed by an additional twelve bismuth salicylate injections of 1 cc. He feels like a new man under this therapy and has remained at his job all this time. He is anxious to discontinue treatment. Has he been adequately treated and can treatment be stopped with safety? If treatment is stopped would the symptoms reappear? Would the spinal fluid show any changes if taken now? He has refused further therapy because he has done so well on that already given. Are there any other recommendations?

Irving S. Snow, M.D., New York.

ANSWER.—For a patient with the so-called malignant or paretic type of spinal fluid plus a group of symptoms suggesting involvement of the central nervous system of this type it would ordinarily be inadvisable to stop treatment, first, because of insufficient amount of treatment for a spinal fluid of this type and secondly because the spinal fluid has not been reexamined recently enough to determine just what effect treatment has had up to this time. The fact that the patient has clinically improved is a favorable prognostic sign, but it does not of necessity mean that the spinal fluid has shown a similar degree of improvement. With treatment stopped the probabilities are that the symptoms will reappear within a year or so in more pronounced and decidedly more advanced form than at the present time. If the reexamination of the spinal fluid still shows the paretic characteristics, the patient may be urged to continue with trypanamide and preparations of bismuth or undergo a fever course, even in spite of the fact that he is clinically feeling well.

STAPHYLOCOCCIC SEPTICEMIA AFTER CARBUNCLE AND INJURY

To the Editor:—In October 1939 I treated for a period of approximately three weeks a patient with a mashed toe, with an infection of soft tissues. Roentgen examination revealed that there was no fracture. There was no lymphangitis or spreading of the infection. The patient continued working at all times. After discharge by me, he came back about a month later and received three more dressings, the condition cleared up and I heard nothing further from him until seven months later, when he sustained a sprain of the hip on the side opposite the original injury to the toe. Three days later he manifested symptoms of a severe infection, which turned out to be staphylococcic septicemia with a possible subphrenic abscess. (One month previously he had been treated by a physician for a carbuncle on the right shoulder, and when I saw him for the sprained hip the carbuncle had not healed and was still draining.) Now comes the question as to the cause of the staphylococcic septicemia. I should appreciate references to any article in this direction. The question has been raised as to whether the patient received a staphylococcic infection at the time of the injury to the toe and this infection remained dormant for several months. However, I have seen numerous mashed toes of this type, and I do not make cultures of the discharge; at the same time, this is the first case of mashed toe I have ever seen in which it is alleged that a staphylococcic septicemia has resulted from the injury at a period seven months later.

S. M. Becker, M.D., Washington, D. C.

ANSWER.—It would seem virtually impossible that the staphylococcic septicemia in this case could be in any way related to the injury to the toe incurred seven months previously. By far the most likely explanation is that the carbuncle was the source of the staphylococcic septicemia. The sprain or injury to the hip probably acted as a focus of lowered resistance at which some of the organisms, circulating in the blood stream from the carbuncle, collected and from there poured into the blood stream to cause the staphylococcic septicemia. It is not impossible that direct injury to the carbuncle may have occurred at the time of the injury to the hip causing the staphylococcic septicemia.

Usually a secondary infection of this kind manifests itself as a metastatic abscess rather than as an infection of the blood stream. Three cases were cited by Frederick Christopher (Minor Surgery, ed. 4, Philadelphia, W. B. Saunders Company, 1940). In the first case a large abscess developed beneath the sternocleidomastoid muscle after an injury; at the same time the patient was suffering from a furuncle of the elbow.

In the second case there was an infected wound of the hand following a fall off a bicycle, and an abscess developed beneath the pectoralis muscle. The pus was found to contain hemolytic streptococci.

In the third case the abscess occurred in the calf of the leg after a boil on the chin. Christopher cited Santee (*Ann. Surg.* 89:772 [May] 1929), who reported 4 cases of metastatic abscess complicated with pneumonia. The first abscess was at the site of the hypodermic injection, the second was subpectoral, the third was over the rectus muscle and the fourth was on the dorsum of the foot.

ELECTRICAL SHOCK THERAPY

To the Editor:—Does psychiatric literature report electrical shock procedures for the treatment of mental disorders? Would it be possible to produce epileptiform attacks by stimulation of the motor area of the brain? Could this area be isolated and stimulated through the skin? Should alternating or continuous currents be used and in what strength and in what arrangement? What would be the dangers, contraindications and possible death limit? These questions, which I asked, were answered in *Queries and Minor Notes* in the issue of June 17, 1939, under the heading "Electrical Stimulation of Brain" in the following manner: "There is no electrical shock procedure for mental disturbances. Epileptic attacks can be produced by stimulating the motor area of the brain, but only when the brain is exposed; this is done only for localizing purposes at the time of operation. With the skull intact, this cannot be done with any degree of safety." Since electrical shock therapy has become, in the meantime, an established therapeutic procedure, I would appreciate a further discussion.

Ernst Fantl, M.D., Beacon, N. Y.

ANSWER.—Electrical shock therapy is now employed in this country as well as in Italy and England and has been tried in Germany. Dr. S. E. Barrera and Dr. Kalinowsky of the Psychiatric Institute of New York, and Dr. Richard Lyman and Dr. Hans Loewenbach at the Duke University, Durham, N. C., are among those doing active electrical therapy at the present time.

In general, alternating current is used without changing the type of current but is put through an induction transformer and a roentgen ray timer in order to control voltage and time of exposure. Voltage is run from 70 to 120 and is timed from $\frac{1}{10}$ to $\frac{1}{2}$ second, as a rule. The electrodes are placed on the temples so as to expose purposely the precentral and frontal regions to a greater extent and to avoid posterior vital centers. It is still unknown as to the exact amount of stimulation which goes to specific parts in the brain.

TREATMENT OF SYPHILIS

To the Editor:—A man aged 30 came for continuation of antisyphilitic therapy, which had been begun by another physician in his home town. Therapy was begun early, as soon as penile chancre developed and diagnosis was confirmed by dark field examination. The patient had mapharsen and bismocymol twice a week for four weeks and then once a week to six weeks. His physician then started him on mercurosal 0.06 to 0.08 Gm. intravenously once a week. At that time he told the patient that, if no secondary lesions developed, treatment could be stopped at three to five months. The patient told me this, which I could not assent to. I told him that as far I knew there were only two methods which had any scientific and proved worth today: the new and as yet experimental five-day treatment, and the conventional year to year and a half or two year "alternating block" method. The patient is cooperative and eager for cure and does not wish to take any risks or half measures in obtaining cure. I told him that I would seek authoritative opinion on the subject. I notice that Moore, in discussing Padgett's paper in *The Journal*, says that, even with a few arsenphenamine treatments early in the disease, patients can be maintained in perfect health as far as syphilis is concerned to the proportion of about 80 per cent. However, with 95 per cent "cure" possibilities by the conventional methods, I feel that this patient would be making a grave mistake in stopping treatment at even six months. Am I not correct? Even though he had somewhat intensified treatment the first six weeks, this is not sufficient reason for discarding the conventional one and a half year method, is it? Further: Is mercurosal as good as or better than the bismuth salts? The patient had bloody diarrhea after his last mercurial injection, which to my mind should certainly contraindicate further mercury administration.

M.D., Ohio.

ANSWER.—The inquirer is correct in believing (a) that the patient described should continue conventional antisyphilitic treatment to a total of eighteen months and (b) that the so-called five day treatment is inapplicable in the present situation.

As to the former point, only the first course of mapharsen and bismuth may be counted on in evaluating the present prospect of "cure" without additional treatment. From this course alone there is perhaps a 65 per cent chance of "cure." Since this may be improved to 95 per cent with the additional treatment recommended by the inquirer, it would be folly not to continue.

There is no information as to the applicability of the so-called five day treatment for patients who have been started on and received a considerable amount of standard treatment. Moreover, the risk of the serious reaction of hemorrhagic encephalitis

is from seventy to two hundred times greater with the five day treatment than with standard treatment, and the applicability of the method under any circumstances is, as the inquirer properly suggests, entirely experimental.

There is good reason for believing that no mercury preparation is as satisfactory as bismuth in the treatment of early syphilis, and there is particularly good reason for believing that the intravenous administration of any bismuth or mercury preparation at weekly intervals is entirely unsatisfactory. It is suggested therefore that the use of mercurosal be discontinued permanently and that treatment be carried on by the continuous method with alternating courses of a trivalent arsenical and with an insoluble or oil soluble bismuth salt.

The inquirer does not mention the results of spinal fluid examination, which should be carried out at about the sixth month of treatment, and the type and amount of further treatment conditioned by the results.

UNILATERAL BREAST ATROPHY AND PRECORDIAL PAIN

To the Editor:—An unmarried white woman aged 23 complains of complete failure of development of the left breast and severe precordial pain coming on without exertion. The latter condition has been occurring frequently during the last five years. The pain lasts from fifteen seconds to ten minutes. The relevant past history reveals ankle edema five years ago, none since. There has been edema of the lower lids for the past five months. There is marked dysmenorrhea and nausea, with heavy flow during the first day. The right breast is well developed and normal; the left breast area shows complete absence of any breast tissue but a normal nipple and areola. There is an irregular area of light brown pigmentation on the left side corresponding to the right breast area but extending below the lowest rib. Other physical findings are within normal limits. The Wassermann reaction is negative. 1. What can be done to develop the left breast? 2. What is the possible relationship of the precordial pain to the undeveloped breast? 3. What can be done for the precordial pain?

Frank F. Becker, M.D., Hawthorne, N. J.

ANSWER.—1. There is little likelihood that this anomalous breast will develop and there is no method of treatment that will bring this about.

2. There does not seem to be any reasonable relationship between the precordial pain and the undeveloped breast.

3. There are numerous conditions capable of producing thoracic pain, such as a fibromyositis of the intercostal muscles or intercostal neuritis. At times even an arthritis of the thoracic spine may produce anterior thoracic pain. Therefore, the treatment of the condition is dependent on identifying its true causation.

UTERINE INERTIA AND ESTROGENIC DEFICIENCY

To the Editor:—A white woman aged 32 has been under my care for two years, having clinical evidence of estrogenic deficiency, such as tingling in the breasts and menstrual irregularities, all of which have responded to theelin therapy. She has recently finished a pregnancy. Two hours after delivery she developed a uterine inertia. Is there any association between the uterine inertia and estrogenic deficiency? If so, I will appreciate any information.

M.D., Texas.

ANSWER.—Tingling in the breasts is usually evidence of theelin activity on the breasts. It is possible that the occurrence of uterine inertia two hours after labor might be due to prolonged labor and exhaustion of the patient or to various other conditions which might lower the patient's vitality. As the body was recently flooded with estrogens, it does not appear that the uterine inertia was due to a deficiency of estrogens. If estrogenic hormone were present in appreciable amounts post partum, lactation would not occur. The most potent endocrine product that could be given a patient for uterine inertia post partum would be small doses of posterior pituitary four to six hours for twenty-four to forty-eight hours, if necessary. Ergot or ergotamine tartrate have also been used for this condition. If the infant is nursing, it would be inadvisable to give the mother estrogenic substance, since that may inhibit lactation.

MYOEDEMA

To the Editor:—The description of the physical phenomenon of "mounding" given by T. P. Sears in his question to *Queries and Minor Notes* (*The Journal*, March 1, 1941, p. 904) far more strongly suggests the condition myoedema (or myo-edema) than the myotatic irritability seen in certain neuromuscular dystrophies. Norris and Landis (*Diseases of the Chest*, ed. 6, Philadelphia, W. B. Saunders Company, 1938, p. 415) defined myoedema as "a local contraction of the muscle, produced by direct percussion and causing a nodular swelling, which rises immediately after percussion, lasts a second or two and then gradually disappears." Although this phenomenon is commonly encountered in tuberculosis, it is not peculiar to the disease. It may also be seen in any severe cachexia, of whatever origin. Incidentally, the term "mounding" is given as a synonym of myoedema in the *American Illustrated Medical Dictionary*.

ROENTGEN THERAPY FOR RHEUMATIC DISEASE

C. J. SMYTH, M.D.

R. H. FREYBERG, M.D.

AND

W. S. PECK, M.D.

ANN ARBOR, MICH.

The use of the roentgen ray in the treatment of rheumatic diseases is not new. Soon after the therapeutic employment of roentgen rays in the field of medicine, reports of their effect on diseases of the joints began to appear. In 1898 Sokolow¹ reported improvement of 4 patients with arthritis he had treated with roentgen radiation. Stenbeck² (1898) treated 52 patients, most of whom he said were "improved." For the following twenty-five years numerous reports dealing with this subject appeared scattered in the literature.

Increased interest in this form of therapy developed about 1925 when Staunig³ reported generally good results from treatment of 400 patients with arthritis deformans, and Kohler⁴ stated that considerable improvement had occurred in 100 patients with arthritis deformans and spondylitis. In the following year Kreuzwald⁵ discussed his experience in treating 100 patients, of whom 87 per cent were said to be considerably improved (subjectively). Von Pannewitz⁶ reported results of the treatment of more than fifteen hundred joints of patients with arthritis deformans chiefly and of treating animals in whose joints were produced lesions said by him to be characteristic of human arthritis deformans. Results were favorable in the majority of cases. Also in 1927, Kraus⁷ published results of treatment of 285 patients with arthritis.

Kahlmeter⁸ has had the largest experience with roentgen therapy. From 1925 to 1937 he treated about 5,000 patients with various kinds of rheumatic disease. In many cases of acute arthritis (gonococcic, gouty and septic) and different types of acute nonarticular rheu-

matism he stated that his results were excellent. In chronic polyarthritis (rheumatoid) he admitted difficulty in evaluating results but thought that the effect was better in patients with more acute polyarthritis, especially those with recent periarticular swelling causing pain.

Scott⁹ has written numerous reports of roentgen treatment for many different diseases, including rheumatic diseases, and has emphasized the excellent results he has obtained in cases of spondylitis "adolescens" (rhizomélisque), in which he gave "wide field" superficial irradiation.

Most of the study in the field of roentgen therapy has been by European investigators. The first American report appeared in 1906, by Anders, Daland and Pfahler,¹⁰ who treated only 2 patients with chronic arthritis. Langer¹¹ (1933) reviewed his results in treatment of 363 patients—65 with atrophic arthritis and 138 with hypertrophic arthritis. In 1935 Garland¹² reported generally good results in the treatment of different types of arthritis—chiefly acute infectious types.

Because of the excellent results claimed by practically every author reporting experiences with roentgen treatment, the paucity of study of this subject by Americans and the suggestions of roentgenologists such as that of Desjardins¹³ that roentgen therapy be used more extensively for rheumatic diseases, we were stimulated to make a critical evaluation of this form of therapy in various rheumatic diseases, especially rheumatoid arthritis, about which there is the least definite information recorded.

METHOD OF STUDY

Only those patients whom we personally studied in great detail in the Rackham Arthritis Research Unit were included in this study. Except for the patients with spondylitis and some localized nonarticular rheumatism (tenosynovitis, bursitis), practically all patients selected for this study had comparable involvement in pairs of joints. In these persons, one of the pair of joints involved would be treated with roentgen radiation and one would be left untreated to serve as a control in order better to evaluate the therapeutic effects. Usually the only other treatment instituted was of a general nature: rest, salicylates, antianemic therapy and heat and exercises to all joints alike between roentgen treatments. In a few instances other forms of physical therapy were applied to the joints not treated with roentgen rays, in order to contrast results.

Read at the seventh annual meeting of the American Rheumatism Association, New York, June 10, 1940.

15 cm. Dose: each field was treated three times, receiving 200 roentgens at each sitting; the treatments were given every other day; the total dose was thus 600 roentgens. Such therapy hereafter will be referred to as "a series of treatments." Most patients were given three series of treatments to the same parts, each series being separated by four to six weeks. The number of joints treated in any series varied from one to six. In some cases new parts were treated after three or more series had been given to the original locations.

In order to study the psychic effect that might be associated with roentgen therapy, some patients were treated exactly as described but with a lead screen placed to protect the part from irradiation. Sometimes treatment screened by lead was employed between series of true roentgen treatment to the same joints; sometimes the first one or two series of treatments given were blocked with lead screens, and subsequently the parts were treated with roentgen therapy. In still other patients, some joints would be treated in the usual manner, and simultaneously comparable joints would be treated but screened with lead. Care was

taken that the patient did not know that such screened joints were not actually irradiated.

Most of the patients studied had a chronic rheumatic condition, and all of these had been under observation long enough to know that they were in a "steady state," the disease not changing in any essential degree when roentgen therapy was employed. As has been empha-

sized by Abrams and Bauer,¹⁴ this is important if one is to evaluate accurately the effects of any type of therapy.

During the course of treatment and throughout the subsequent period of observation, all patients were interviewed frequently. Questions that were in no way leading were asked in order to learn the subjective response; careful examinations were made frequently by the same physician to detect physical changes, especially in regard to the joints; photographs were taken at intervals; frequent erythrocyte sedimentation rate determinations were made by the Rourke-Ernstene¹⁵ technic; in many cases roentgenograms of joints were compared before and after treatment; in some cases a study was made of the cell content of synovial fluid aspirated simultaneously from treated and comparable untreated joints before and several times during the course of therapy; in a few cases histologic examination

was made of synovium and joint capsule obtained after treatment.

In evaluating the effect of roentgen therapy, changes in treated and similarly diseased untreated joints were compared. Clinical results were considered from the subjective and the objective standpoint and were graded none, slight, one, two, three and four plus, to indicate an increasing amount of improvement.

RESULTS

One hundred patients with different types of rheumatic diseases were studied (table 1). In all two hundred and ninety-three joints¹⁶ were irradiated; in so doing seven hundred and ninety-eight separate applications of roentgen rays were given. Most of the patients were observed for at least six months after therapy was begun. Ten patients were studied less than three months and 14 from three to six months. The majority of patients in these two groups were being studied with lead screen control for psychic effect. Forty-nine patients were carefully studied for from six to twelve months, and 23 for from twelve to eighteen months; 4 were followed more than eighteen months.

16. The hand and foot and the cervical, dorsal, lumbar and sacral portions of the spine are considered in this study as a single joint.

Clinical Results in Rheumatoid Arthritis.—The clinical results of roentgen therapy in 57 patients with characteristic rheumatoid arthritis, in various stages of the disease, always with active synovitis, are summarized in detail in table 2. It should be noted that 44 per cent of these patients had no benefit from roentgen treatment, and in 74 per cent there was no objective evidence of improvement. Of the 26 per cent in whom objective evidence of benefit occurred it was of significant grade in only 14 per cent. In 21 per cent of the group the subjective improvement, which was the only benefit noted, lasted for less than one month, and temporary improvement (lasting less than one month) of subjective and objective nature occurred in 5 per cent of patients. In some persons benefit was noted in only some of the joints irradiated.

The clinical results were carefully examined in respect to various differences in the patients and the disease. No correlation was found between clinical results and (1) the age of the patient, (2) the duration of symptoms of arthritis or (3) the activity of the disease as determined by local signs, leukocytosis, fever and sedimentation rate of erythrocytes. In regard to the extent of the arthritic involvement (number of joints affected) there was no correlation—except that in 3

appear in table 5. Here the effect appears to be decidedly different from that in patients with rheumatoid arthritis of peripheral joints. Definite subjective and objective evidence of benefit was noted in 74 per cent of the cases and was certainly of significant degree, and not just temporary, in 67 per cent. Naturally, in

those patients with extensive calcification of ligaments, great improvement of motion of the affected parts could not be expected, but we were surprised and pleased to observe increase of significant degree in motion of the back, often when pain decreased.

Clinical Results in Nonarticular Rheumatism and in Degenerative Disease of Joints (Hypertrophic Arthritis).—Eight patients with various types of nonarticular rheumatism were treated. The results are summarized in table 6. Two patients had peri-arthritis of the shoulders; the duration, extent and severity of involvement were comparable in the two, as far as could be determined. One patient reported no benefit; the other reported moderate clinical improvement—but improvement occurred equally in the treated and screened shoulder, indicating only psychic effect. In 1 patient with calcified subdeltoid bursitis with symptoms for only four months there was moderate symptomatic improvement and increased ease and range of motion. Roentgenograms three months after therapy showed a decrease in the size of calcification in the bursa. In 1

cases in which only one or two joints were involved when roentgen therapy was given results were better than in the group at large. These were the patients with early or acute rheumatoid arthritis with unsatisfactory control joints (untreated) in whom remission of severe synovitis often tends to occur naturally, so that evaluation of roentgen effect is difficult.

We were impressed with the frequency of a report by the patient such as "As soon as I heard the machine working, I began to feel better." This statement was most often made by those with subjective benefit only. This suggested to us that some or all of the subjective benefit might be of psychogenic origin, and this factor was objectively studied by preventing roentgen rays from reaching the part to be treated by the use of lead screens as described. The purely psychic benefit resulting from such treatment as studied in 15 additional cases of rheumatoid arthritis is summarized in table 3. In all but 3 of the 15 cases as much benefit occurred when parts were screened as when irradiated. Thus it is clearly demonstrated that much but not necessarily all of the subjective benefit may be of psychogenic origin.

In patients with rheumatoid arthritis definite exacerbation of synovitis occurred just as frequently in joints treated with roentgen rays as in the untreated joints. As shown in table 4, such exacerbations were noted soon after treatment in 16 per cent of the cases. We interpret this to indicate that roentgen therapy as given did not protect the joints from suffering increased inflammation for even a short time.

Clinical Results in Spondylitis Rhizomélisque.—The clinical results in 15 cases of spondylitis rhizomélisque

patient with fibrositis involving each hand comparably there was only psychogenic symptomatic benefit—as shown by lead screen control in treating one hand. Each of 3 patients with achillobursitis showed different results. There was no benefit in 1 patient repeatedly treated for tenosynovitis. (Treatment was first given five weeks after the symptoms began.)

It is in this group of patients that one might expect the best and the most consistent benefit, but in our small group of patients the results were discouraging. In 2 of the 3 patients controlled by lead screens, benefits were shown to be psychogenic. The nature of the disease often does not allow comparable untreated control

parts, so that the results are less dependable when critically examined.

Only 4 patients with degenerative joint disease were studied. Two had roentgen therapy to the fingers and 2 to a hip joint; in all cases opposite comparably involved joints were left untreated. The results (table 7) were poor.

Changes in the Rate of Sedimentation of Erythrocytes.—In patients with active rheumatoid arthritis and spondylitis rhizomélisque, the erythrocyte sedimentation rate is usually elevated, and reductions in rate are considered by most students of arthritis to indicate improvement in the disease process. We were able to follow the changes in erythrocyte sedimentation rate in most patients treated. The results are shown in table 8. Definite decreases in rate occurred in only 15 per cent of patients with rheumatoid arthritis. In these

cases the degree of fall, graded slight, moderate or severe, is correlated with the clinical results, both subjective and objective. It should be noted that in general there is no correlation, except that 2 patients with only slight decreases in sedimentation rate had no clinical improvement, and the 1 patient with great decrease in sedimentation rate showed 3 plus clinical improvement. This patient had acute rheumatoid arthritis.

Notice that there was a decrease in erythrocyte sedimentation rate in 40 per cent of patients with spondylitis rhizomélisque. Again there is no close correlation between the changes in sedimentation time and clinical results. The patient with a great reduction in sedimentation rate and 3 plus clinical improvement had clinically characteristic early spondylitis without abnormal calcification.

Changes in Roentgenographic Appearance of Treated Joints.—Sufficient roentgenograms of joints to allow a study of any changes during and following roentgen therapy were made of 30 patients with rheumatoid arthritis and 5 with spondylitis rhizomélisque (table 9). It is clearly shown that no anatomic improvement was demonstrated by roentgen rays in any case. Frequently, increased destruction or atrophy, characteristic of progression of the disease, would be noted in the treated joints as well as in the untreated. There was no correlation between changes in the roentgenograms and clinical results; not infrequently in patients who reported symptomatic improvement following roentgen therapy subsequent roentgenograms of the treated joints showed more extensive anatomic abnormalities.

Cytology of Synovial Fluid.—In 12 patients with rheumatoid arthritis synovial fluid was aspirated simul-

taneously from two comparable joints, usually the knees. Subsequently, one joint would be treated with roentgen radiation, the other left untreated. At intervals during and after therapy each joint was again aspirated. The cell content of the synovial fluid was studied. The results are compiled in table 10. There was a decrease in the number of cells in the fluid from treated joints only or predominantly in only 3 patients (C. J., C. M. and M. M.). In all others there was either no change or comparable changes in the fluid of the treated and of the untreated joints. There was no correlation between the cell content of synovial fluid and clinical effects of roentgen therapy.

Histologic Changes.—In 5 cases of rheumatoid arthritis we were able to examine capsular tissue removed for biopsy or during synovectomy. In no case was any change recognized as an effect of roentgen therapy.

Ill Effects.—There were no recognizable ill effects of any kind in 68 of the 100 patients treated. In some who had three or more series of treatments to the same parts there was moderate local pigmentation and depilation, commonly seen after irradiation. Sometimes thickening of the skin was noticeable. In 12 per cent of the patients with rheumatoid arthritis a temporary increase in pain in the joints was complained of. This was unaccompanied by objective changes and did not indicate the subsequent course; some patients had no benefit; others had different degrees of improvement.

In only 2 patients with rheumatoid arthritis did nausea or anorexia occur, and, to show the powerful psychic effect, one of these persons had all radiation screened by lead!

Gastrointestinal symptoms were common in patients with spondylitis whose backs were treated; anorexia,

COMMENT

Why roentgen therapy should be beneficial in rheumatic diseases, and, if it is, how its effects are produced, are questions that deserve consideration. In discussing radiotherapy for inflammatory conditions, Desjardins¹³ emphasized the destructive effect of irradiation on leukocytes, especially in suppurative inflammations, and the possible mechanism of benefit therefrom. But relatively few forms of rheumatic disease are suppurative, and certainly the more common forms of chronic arthritis are nonsuppurative! It is difficult to see how any explanation based on leukocyte destruction can be logical in rheumatoid arthritis or in spondylitis rhizomélisque. Our study of synovial fluid did not reflect any consistent destructive effect on the leukocytes therein. None of our studies revealed any information to elucidate the mechanism of roentgen effect. Och-sner¹⁷ enumerated several other theories to explain benefit that could result from roentgen therapy in inflammatory diseases; some depend on histologic changes; others involve chemical, metabolic or immunologic effects. All lack convincing proof. After careful search we are unable to find a satisfactory explanation of the *modus operandi* of roentgen therapy in this group of diseases or any theoretical background which would suggest its use.

The technic of irradiation employed by various investigators has differed considerably; the voltage, filtration, skin-target distance, size of the field, number of ports, number of roentgens delivered at each sitting, frequency and number of applications and total dose all have varied. Some authors have stated that results depend a great deal on small changes in physical factors of irradiation.⁹ This seems unreasonable to most students of this problem. After careful investigation of different methods that had been used, we adopted the method described because it seemed most suitable and because it was essentially the technic used by Kahlmeter,⁸ whose experience has been the largest and whose results have been among the best reported. There is as much theoretical support, and more clinical support, for the value of this method of treatment as for any others described. It must be clearly borne in mind, however, that only one technic has been employed in our investigations, and all of our conclusions are based on this technical method.

Further, the technic employed is a type of local, high voltage roentgen therapy. From all evidence at hand its effect is restricted to the part irradiated or a small surrounding area. On this basis we feel justified in contrasting changes in treated and comparably diseased, untreated joints in evaluating the effect of irradiation.

Subjective benefit was much more frequently reported than objective evidence of improvement could be demonstrated. The symptomatic improvement most frequently reported was partial or complete relief of pain; decrease in stiffness and greater ease and range of motion were less often noticed. Objectively, decrease in swelling and tenderness and increase in range of motion were observed in the order named.

Because of the often encountered natural remissions in chronic rheumatic disease, especially in rheumatoid arthritis, the necessity for careful control of all studies aimed to evaluate any therapeutic procedure cannot be

nausea, vomiting or diarrhea occurred as a rule when the dorsal or lumbar part of the spine was treated, alone or along with the remainder of the spine. These symptoms always completely subsided in two or three days after therapy.^{16a}

16a. In 2 among about 30 cases of spondylitis rhizomélisque treated with roentgen rays since this report was prepared we have observed significant leukopenia shortly after treatment, which in each case was given to the entire spine. The decrease in white blood cell count was chiefly in the lymphocyte series. There was complete recovery from the leukopenia in two weeks in 1 case and after four weeks in the other.

17. Och-sner, H. C., and Mumford, E. B.: Roentgen Therapy for Painful Conditions of the Bones and Joints, Radiology 34: 444-448 (April) 1940.

overemphasized. Rigid control in the evaluation of our results largely accounts for the much less glowing results of our investigation when compared with reports of others. Frequently improvement was reported by the patient or observed by the examiner in treated joints which could and probably would have been attributed to the effect of irradiation had not similar or greater improvement simultaneously occurred in comparable untreated joints. Further, no one doubts that the psychic effect of roentgen therapy can be great. The results of the study employing lead screens leave little doubt that many of the patients with rheumatoid arthritis listed in table 2 as showing only subjective benefit had symptomatic improvement on a psychogenic basis. Thus proper attention to "control" in this critical evaluation reduces what might have been considered as about 80 per cent beneficial results of treatment in cases of rheumatoid arthritis to less than 30 per cent.

In this regard it should be pointed out that the effect of treatment in cases of spondylitis cannot be controlled well by untreated parts because of the location of the disease. Further, our results have not yet been sufficiently controlled by lead-screened treatments. When so controlled, the benefit apparently due to roentgen irradiation may be found to diminish. However, the high percentage of patients who showed definite objective evidence of improvement suggests that the majority of benefit noted is truly a roentgen effect. This is being studied further.

The diagnosis of spondylitis rhizomélisque is never questioned when roentgenograms of the spine show calcification of paravertebral ligaments, but after calcification no treatment could be expected to mobilize the spine. Satisfactory treatment of this disease depends to a large extent on early diagnosis and the institution of effective therapy before the occurrence of abnormal calcification. Diagnosis at this early stage, however, may be shrouded in doubt. Two patients in whom we made the diagnosis of early spondylitis rhizomélisque had the most dramatic benefit from roentgen therapy; in 1 there was almost complete disappearance of all clinical evidence of disease. In each instance symptoms had been present only six to nine months; the clinical manifestations were typical; roentgenograms showed disease of the sacroiliac joint, and there was elevation of the erythrocyte sedimentation rate. We believe that these patients had spondylitis rhizomélisque, but we recognize the possibility of doubt. We shall watch the course of events in these and similar patients with great interest.

Scott⁹ has reported excellent results from treating more than 400 patients with spondylitis rhizomélisque with an entirely different technic of irradiation, which he calls "wide field" therapy. He administered relatively small amounts of irradiation superficially to large areas of the trunk (back and front). He did not treat the affected parts (by local high voltage therapy), and he emphasized the necessity for irradiating large areas of the body, believing that in some way the body thereby becomes better able to resist and cure this disease (and many others). To us his arguments and rationale are not convincing. We have, however, critically examined a patient with spondylitis rhizomélisque several times before and after he received treatment by Scott, and we are convinced of the clinical and laboratory evidence of improvement which followed the therapy. Although nothing can be stated, on the basis of this one case we are planning to study the effects of this method of

therapy further. Some patients treated by us, with the high voltage roentgen technic, have improved in just as satisfactory a manner.

The sedimentation rate of erythrocytes failed to indicate any constitutional improvement in most patients with rheumatoid arthritis. Of course, we treated only half, or less, of the affected joints of most patients, which may be a factor in this regard. We were especially disappointed that in so many patients who had exacerbations of synovitis recently irradiated joints shared equally in the increased inflammation. In some cases increase in the severity of the disease occurred only in treated joints. (These exacerbations are not to be confused with the temporary symptomatic flare-ups which sometimes occurred during treatment. They were the changes commonly seen with relapses in rheumatoid arthritis.) Irradiation seems to offer no protection against such exacerbations.

Many of the older reports and Kahlmeter's⁸ more recent studies indicate that roentgen therapy gives good results consistently in the acute inflammatory types of arthritis, such as gonococcic and gouty arthritis, and in the more acute forms of nonarticular rheumatism. Certainly this form of therapy would not be preferable to the highly satisfactory chemotherapeutic agents now available for the treatment of gonococcic and gouty arthritis. Many acute forms of nonarticular rheumatism are of such short duration that the time needed for safe, repeated irradiation limits its usefulness in these cases. In the more obstinate cases our results were discouraging. Much of the subjective benefit obtained in these cases was shown to be psychogenic. However, our experience with nonarticular rheumatic disease is insufficient to permit a final opinion.

In the few cases of degenerative joint disease studied, results were poor, but more patients will need to be observed before satisfactory evaluation can be made. If symptoms of this disease are largely due to associated fibrositis, as Abel, Siebert and Earp¹⁸ stated, benefit could more likely be expected than if it depended on alteration of the joint structure proper. Because roentgenograms showed no benefit to the bones and cartilage of the joints any effect of roentgen irradiation seems definitely limited to soft tissue.

The general limitations of this form of treatment need to be kept in mind. Only a few parts can be treated at a time, and if extensive polyarticular involvement exists, as it does so commonly in rheumatoid arthritis, adequate treatment of all parts might be impossible or could be accomplished only with great inconvenience. The availability of roentgen therapy is greatly restricted, and the expense would often prohibit its use. The only real danger known is the damaging effect of irradiation on the skin.¹⁰ We have seen 1 patient who had extensive treatment to the hands (given elsewhere) in whom there subsequently developed what appeared to be early irradiation dermatitis.

The most important theoretical and practical criticism of roentgen treatment of rheumatoid arthritis is that it is local treatment for a constitutional disease. It would seem highly fantastic to expect favorably to influence the disease in general by local irradiation. However, often patients with many joints affected are kept

18. Abel, Oliver; Siebert, W. J., and Earp, Ralph: Fibrositis, *J. Missouri State M. A.* 38: 435-437 (Nov.) 1939.

19. Leukopenia observed in cases of spondylitis rhizomélisque in which treatment over a large portion of the spine was administered has already been mentioned in a previous footnote.

uncomfortable or are incapacitated by persistent severe inflammation in only one or two joints. It was in this group of patients that we hoped for good results from roentgen treatment, but especially in this group results were undependable and in general discouraging.

SUMMARY

One hundred patients with rheumatic disease who were given local high voltage roentgen irradiation were carefully studied under well controlled conditions for the effect of this form of treatment. In a large group of patients with rheumatoid arthritis, 44 per cent showed no subjective or objective benefit that could be attributed to irradiation; in 30 per cent only subjective benefit occurred; in only 26 per cent was there any objective improvement which could be attributed to roentgen therapy, and this was of significant grade in only 14 per cent. Decrease in pain was the chief symptomatic improvement, and this was clearly shown to be of psychogenic origin in many of the patients. The joints irradiated were not protected against subsequent exacerbation of synovitis. No correlation was found between clinical results and age of the patient or duration or activity of the disease; results were slightly better in patients with early rheumatoid arthritis.

In 85 per cent of the patients the erythrocyte sedimentation rate remained unchanged or it was increased. There was no close correlation between changes in sedimentation rate and clinical results. There was no improvement in the roentgenographic appearance of the joint cartilage or bones in any instance; more extensive anatomic changes appeared in some patients clinically improved. No consistent change was observed in the synovial fluid or the capsules of the joints treated. Thus in patients with rheumatoid arthritis roentgen irradiation by the technic employed gave unpredictable and unreliable results, which by careful study were shown to be far less satisfactory than other reports have suggested, and in general they were so discouraging that we have abandoned this treatment except in rare, obstinate cases or cases in which a psychic effect is desired.

Significant subjective and objective results were obtained in 74 per cent of 15 patients with spondylitis rhizomélisque. Some patients had complete disappearance of symptoms, and in 2 patients with early spondylitis there was almost complete disappearance of all clinical evidence of disease. The sedimentation rate of erythrocytes decreased significantly in 40 per cent. Roentgenographic abnormalities were not favorably altered. The nature of the disease does not allow a satisfactory control of the investigation, and psychic effects have not yet been sufficiently studied, but in general we are quite encouraged with the possibilities of roentgen irradiation in this type of arthritis, and we are studying it further.

Our experience with degenerative disease of joints and nonarticular forms of rheumatism is insufficient to allow critical appraisal of the value of roentgen therapy. The results in general have been discouraging. Part at least of the symptomatic benefit has been psychogenic.

The rationale for employment of roentgen therapy in rheumatic disease and its *modus operandi* remain to us a complete mystery.

MITRAL STENOSIS AFTER EIGHTY

WITH ESPECIAL REFERENCE TO
DR. HERMAN F. VICKERY

PAUL D. WHITE, M.D.

AND

EDWARD F. BLAND, M.D.

BOSTON

It is common knowledge that rheumatic heart disease is sometimes found after middle age and that it does not necessarily limit life to three score and ten, but survival beyond 80 years is so unfamiliar as to demand a special note. We are herein reporting, first, the striking case of Dr. Herman F. Vickery, who not only reached his eighty-fourth year with a moderate degree of mitral stenosis but also lived his long life actively and without cardiac symptoms except for angina pectoris at the end of his life, and, second, 3 other cases of proved mitral stenosis in Boston with survival beyond the age of 80.

Coombs¹ in 1924 reported that the oldest of a series of 281 patients with established rheumatic heart disease was 70. In Grant's² series of 1,000 men suffering from heart disease the oldest patient with mitral stenosis was 59. In 1926 Cabot³ reported that 6 patients between 70 and 80, but none over 80, had disease of the mitral valve among 208 persons shown to have had rheumatic heart disease in a series of four thousand autopsies at the Massachusetts General Hospital between 1896 and 1919 and that 1 patient in the eighth decade in his outpatient and private practice had had it. Edström⁴ in 1935 reported that no patient in a large series in Sweden was over 80. DeGraff and Lingg⁵ found that 5 among 644 patients with rheumatic heart disease from the cardiac clinic of the Bellevue Hospital in New York known to be dead were between 70 and 80 years old; none was over 80. Conversely, none of 83 patients between the ages of 80 and 90 in a series of 5,215 on whom an autopsy was performed at the Boston City Hospital showed rheumatic heart disease.⁶

Recently, however, mitral stenosis has been found at autopsy on a woman who died at 80 and had been known to have had auricular fibrillation for twenty-five years before her death.⁷ Dr. Robert Starr⁸ of Hartford, Conn., has also recently told us of a patient with mitral stenosis whom he first saw in 1928 at the age of 73 and who continues in fair health, now 85 years old and as active as any person of that age.

PRESENT SERIES OF PATIENTS

CASE 1.—Herman F. Vickery, noted physician, was born in Rochester, N. Y., in 1856. He was always slight in build but active and well until old age, except for a period of a year of delicate health of uncertain nature in boyhood at which time he was out of school. He smoked considerably until he was 79 but used little alcohol. He exercised vigorously, rowing for many years, riding a bicycle in his early days of practice and

gardening even in his old age. He was never stopped by symptoms until the age of 77, when he gave up playing more than nine holes of golf at a time because of dyspnea on the grades and easy fatigue. Two years later angina pectoris came on and limited him sharply, so that he could hardly walk around a block in winter weather. He had rarely been examined but had been granted life insurance in his youth.

His father died of apoplexy at 63 and two sisters of cancer at 45 and 55 respectively. His mother lived to be 81. One son died of rheumatic heart disease at 15 years. Three children were well.

We were asked to see Dr. Vickery because of his recent and increasing angina pectoris in February 1936, when he was 79½ years old, four years before his death. At that time he looked well but was slightly deaf. His deafness increased during the rest of his life, especially after an attack of otitis media in 1937. There was a moderate arcus senilis in each eye. The jugular pulse was normal. The heart was slightly enlarged, with accentuated first and third sounds at the apex and second sound in the area of the pulmonary valve, and there was a slight mid-diastolic murmur at the apex. The rhythm was regular except for rare premature contractions, the pulse rate was 70 and the blood pressure was 190 systolic and 100 diastolic. There was no evidence of congestive failure. Aminophylline and glyceryl trinitrate were prescribed along with much limitation of activity, light meals and abstinence from tobacco.

In May 1936 he reported himself much improved, able to walk around Jamaica Pond (about two miles) and to play nine holes of golf. He had used only a few tablets of glyceryl trinitrate in the previous few months but with benefit each time. His blood pressure was 175 systolic and 85 diastolic. No murmurs were heard. The electrocardiogram showed normal rhythm at a rate of 75 with high T waves in lead 1, slightly inverted T waves in lead 2 and deep T waves in leads 3 and 4. Fluoroscopic examination revealed that he had a slight enlargement of the heart, clear lungs and a dense but not widened aorta.

In October 1936 he was well, having golfed and gardened during the summer with only rare attacks of angina pectoris. No cardiac murmurs were noted. His electrocardiogram had returned essentially to normal, with upright T waves in leads 2 and 4.

On Feb. 8, 1937 he came to the office unusually well for that time of year and with an essentially normal electrocardiogram, but three days later he caught a cold, and for several weeks he was ill with bronchopneumonia and otitis media. During this time there was a period of auricular fibrillation which lasted a week, but no murmurs were heard. Therapy with digitalis was begun during this paroxysm of fibrillation, omitted at its end but resumed a month later because of some persistent dyspnea. He continued to take a daily ration of digitalis (1 grain [0.065 Gm.]) for the rest of his life (somewhat less than three years), but he was free from auricular fibrillation after that illness in the late winter of 1937.

In the fall of 1937 he was well except for dyspnea on little effort, with slight cyanosis. He had no angina pectoris and could lie flat without trouble. Examinations revealed no change except for rales and emphysematous breathing at the bases of both lungs which persisted thereafter and were at first interpreted as evidence of congestive heart failure and later correctly ascribed to a bronchial infection. In December 1937 and March 1938 the rales were still present at the bases of the lungs, and a slight presystolic murmur was heard at the cardiac apex. During the rest of 1938 and throughout 1939 Dr. Vickery remained much limited by his dyspnea. He had to give up golf and could do only a little gardening. He had had no angina pectoris for a long time, partly at least because he was relatively inactive because of his dyspnea.

On Dec. 8, 1939 examination revealed no change except that a definite apical diastolic murmur with presystolic accentuation was heard. A diagnosis of slight mitral stenosis was made despite the patient's 83 years. Knowing our interest in his cardiac condition, although himself skeptical of the diagnosis, he asked his family to permit a postmortem examination when the time should come.

During the early winter of 1939-1940 Dr. Vickery grew steadily weaker, more dyspneic and finally cyanotic despite all

therapy, including oxygen, which would give him temporary benefit. He had no fever then. Toward the end of January he had a mild acute infection of the respiratory tract which he seemed at first to resist, but he finally died in coma on February 22, his death being due, it was thought, primarily to bronchopneumonia.

Postmortem examination by Dr. Tracy Mallory revealed bronchopneumonia at the bases of both lungs with a slight amount of bronchiectasis at the base of the left lung. There were extensive, dense, fibrous pleural adhesions. The heart was somewhat enlarged, weighing 425 Gm. The myocardium was firm and of normal color without scars. The left ventricular wall was thicker than normal, measuring 17 mm.; the right ventricular wall was 4 mm. thick. All the valves were normal except for the mitral, which showed a slight to moderate degree of stenosis with nodular adherence between the cusps, thickening and shortening of the chordae tendineae and scarring of the apices of the two papillary muscles. The circumference of the mitral valve measured 7.5 cm. Little calcification was present in the deformed valve, ruling out a possible calcareous valvular disease. On the auricular surface of the most nodular part of the valve there was a fresh thrombus 3 mm. in diameter. The left auricle showed little or no enlargement. The left coronary artery showed moderate atheroma and narrowing of all its main branches, consisting of two rather small anterior vessels evidently taking the place of the usual large anterior descending branch, and of a small circumflex branch. The right coronary artery was large, with crescentic thickening of its wall but no significant narrowing. The mouths of the coronary arteries were fully patent and the ascending aorta was in fairly good condition, but the descending aorta from the arch to its bifurcation into the common iliac arteries showed extensive atheromatous deposits with much calcification. The pulmonary artery and great veins were normal. The liver was acutely congested but not cirrhotic; it weighed 1,800 Gm. The gallbladder, bile ducts, pancreas, gastrointestinal tract, spleen and urinary tract were essentially normal, except for diverticulosis coli.

In summary, there was found a moderate amount of non-calcific mitral stenosis and of arteriosclerosis with narrowing of the main branches of the left coronary artery, slight hypertrophy of the left ventricle, extensive sclerosis of the descending aorta, and bronchopneumonia in both lungs with bronchiectasis at the base of the left lung.

The foregoing is interesting and important evidence of the ability of the heart to withstand the strain of a moderate amount of mitral stenosis even in advanced age. It is probable that the rheumatic heart disease, for the pathologic picture is typical of such, developed in early childhood when he was in "delicate health" for a year but never progressed to a crippling degree, nor was there evidence of recurring rheumatic infection to trouble him. It is of interest that a child of his died of rheumatic heart disease at 15, but there was no story of Dr. Vickery's having been ill at that time. He was of fairly tough stock except for the malignant disease of his two sisters and the hypertension suffered by his father, a tendency to the latter evidently being an inherited characteristic of his own.

The stenosis of the mitral valve was not of the fish-mouth or buttonhole variety. It was not even extensive enough to cause an appreciable enlargement of the left auricle, either ante mortem or post mortem, or of persistent auricular fibrillation, and only occasionally, when the flow of blood was speeded up or careful search was made, was the characteristic mitral diastolic murmur heard.⁹ Evidently there was just enough mitral stenosis to diagnose but not to worry about clinically. In his case, therefore, and we dare say in many others, the mitral stenosis may be regarded as largely of academic interest, provided rheumatic reactivation does

9. It is unlikely also that the mitral stenosis in Dr. Vickery's case played any important part in the causation of his angina pectoris.

not take place. It is possible but not probable that Dr. Vickery's "rheumatic heart disease" developed late in his life. If it did, it is equally noteworthy.

The most interesting considerations of all in the case of Dr. Vickery were his own medical achievements and opinions about rheumatic heart disease. He graduated from Harvard College in 1878 and from the Harvard Medical School in 1882, and became one of the leaders of his generation in internal medicine in this country. He was house pupil and later for many years one of the medical visiting physicians at the Massachusetts General Hospital. He studied for a year, from 1883 to 1884, at Leipzig and Vienna and taught clinical medicine thereafter at the Harvard Medical School. He also conducted a large consulting practice. An able teacher and clinician, he translated Strümpell's textbook of medicine in 1886; this not only was the leading work on the subject here until Osler's book appeared in the nineties but went through four editions, the last in 1911. Among other writings, there appeared the following observations of special immediate interest to us on the prognosis in heart disease by him in collaboration with Whittier and Greene.¹⁰

Citing Leyden the authors stated that the prognosis is more favorable than was formerly regarded.

"In mitral disease, only about 2 per cent of the cases die suddenly. In a considerable number of cases the length of life is not essentially shortened by the disease" (p. B 28).

"Valvular lesions may cause no subjective symptoms, the disease being discovered incidentally. It is wrong to give such a patient a gloomy prognosis. . . . Again, the less the hypertrophy (or dilatation), the more favorable the prognosis" (p. B 32).

"One woman had suffered from mitral stenosis for twenty years, and during that time had borne seven or eight children, and she was now in pretty much the same condition as before" (p. B 37, quoting G. S. Middleton).

The authors also referred (p. 36) to the clearing of cardiac murmurs after the clearing of rheumatism and (p. 35) to the milder valvular lesions in cases of chorea.

Not knowing of his own heart disease until the end of his life, Dr. Vickery exemplified in his own person the good prognosis that may exist in mitral stenosis.

CASE 2.—Harriet Hull, aged 82, a spinster, entered the Massachusetts General Hospital on Sept. 22, 1939. She was known to have had rheumatic fever at 50 with mitral stenosis thereafter, and she had been "in and out of heart failure" several times for a number of years prior to admission to the hospital. She had been receiving digitalis and diuretic therapy and had lapsed into unconsciousness a few hours before arrival. Examination on admission revealed that the heart was moderately enlarged, with a loud mitral diastolic murmur at the apex. The rhythm was regular, although she had had paroxysms of auricular fibrillation in the past. The blood pressure was 120 mm. of mercury systolic and 60 mm. diastolic. There were rales at the bases of both lungs and slight pitting edema of the legs. An indurated mass in the left breast was thought to be carcinoma. She failed to respond to therapy; the lungs became increasingly congested and the coma more pronounced. She died a few hours after entry.

At postmortem examination there were signs of congestion in the lungs, slight cerebral edema, chronic vascular nephritis, carcinoma of the breast and chronic rheumatic endocarditis of both the mitral and the aortic valves. The mitral valve was considerably thickened, partially calcified and moderately stenosed. The circumference of the orifice measured approxi-

mately 6 cm. The heart weighed 290 Gm. The coronary arteries showed only minimal atherosclerotic plaques.

CASE 3.¹¹—Frank Hampton, aged 77, unemployed, was first seen in the outpatient department of the Massachusetts General Hospital because of exertional dyspnea, slight swelling of the ankles and failing vision (cataracts). He had had rheumatic fever at 52. A diagnosis of rheumatic heart disease with aortic stenosis and regurgitation, mitral stenosis and auricular fibrillation was made. His blood pressure was 130 mm. of mercury systolic and 65 mm. diastolic. The last four years of his life were spent quietly and comfortably at the Home for Aged Men. His ventricular rate was controlled by maintenance rations of digitalis. He died at the age of 81 (Dec. 16, 1932), primarily of thrombosis of the superior mesenteric artery, with resulting gangrenous enteritis and fibrinous peritonitis.

At postmortem examination the heart weighed 575 Gm. The pericardium was completely obliterated by old fibrous adhesions. The mitral valve showed well marked stenosis. The orifice was firmly fixed in a patent position and measured 1.5 by 2 cm. The valvular cusps were thickened and fused. The aortic valve also showed stenosis and fixation—the orifice measured 1 cm. in diameter. The coronary arteries showed only slight atherosclerosis. Microscopic sections of the myocardium revealed a great increase in fibrous tissue but no evidence of rheumatic activity. Cerebral arteriosclerosis and areas of cerebral softening were found in addition to the intra-abdominal condition (mentioned previously) which caused his death.

CASE 4.¹²—Augusta Alexander, aged 83, a housewife, a Russian Jewess with normal family and past histories, was sent into the Beth Israel Hospital in a moribund state by her local physician on Nov. 19, 1933. Her illness had begun about ten weeks before with increasing dyspnea, orthopnea and swelling of the ankles. For the six weeks before admission the patient had been confined to bed. Physical examination revealed that she was well developed and well nourished; she had deep cyanosis of the face and was gasping for breath. The pupils were round, equal and regular and reacted normally. There were bilateral ripe cataracts. The thyroid gland was not enlarged. There was a slight increase in the anteroposterior diameter of the chest. Respirations were rapid and shallow and breath sounds normal. Tactile and vocal fremitus could not be tested. There was a moderate number of rales in the bases of both lungs, especially the right. The heart was moderately enlarged; the sounds were slow, faint and of poor quality. There was a loud, harsh systolic murmur heard best at the apex. The abdomen was soft and slightly distended. The edge of the liver could be felt 5 cm. below the costal margin. There was slight pitting edema over the sacrum with moderate edema over the legs up to the knees. There was moderate peripheral arteriosclerosis. All the deep reflexes were equal and active. The blood pressure was 130 systolic and 70 diastolic. The patient died suddenly less than an hour after admission.

At autopsy there were seen a moderately enlarged heart (525 Gm. in weight with thick right and left ventricular walls, 15 and 25 mm. respectively); a calcified mitral valve which was also greatly stenosed, admitting one finger with difficulty, although the circumference measured 7.5 cm.; a calcified, moderately stenosed aortic valve (5.7 cm. in diameter); slight pulmonary emphysema; an extensive antemortem clot filling the main trunk of the pulmonary artery and extending into both branches; primary carcinoma of the right lung; an enlarged nutmeg liver; a scarred gallbladder; two duodenal ulcers, one of which was penetrating the liver and the other the pancreas; moderate arteriosclerosis, peripherally and of the coronary arteries, and several hundred cubic centimeters of fluid in each pleural cavity.

Thus, we have in recent years come across 4 patients with proved mitral stenosis in Boston who survived 80 years and who were in fairly good health till old age. Doubtless there have been others here and elsewhere undiscovered, partly because it is not common to bother about autopsies in extremely aged persons

10. In the Section on Diseases of the Heart, Pericardium and Arteries in Sajous, *Annual of the Universal Medical Sciences*, Philadelphia, 1890.

12. Permission to include this case was given by Dr. Harry Derow and Harry Levine.

and partly because lesions of this sort have not been looked for with special care after the age of 70. Four reasons for such longevity may be mentioned: first, a relatively mild to moderate degree of the mitral stenosis in some of the cases as in that of Dr. Vickery; second, the possible late development of the rheumatic heart disease suggested by rheumatic fever at 50 or after in cases 2 and 3; third, a relatively quiet and careful life, as illustrated in cases 2 and 4, and fourth, an ancestral inheritance of longevity probably present in all. It would be of interest to attempt a more careful analysis of these factors with more extensive material.

That even extensive mitral stenosis, more advanced than that seen in these 4 cases, is compatible with survival to old age may be added here with the striking example we encountered only a few weeks ago: Mrs. A. McG., aged 73, died of bronchopneumonia with but little heart failure. She had lived a sheltered life after a youth in which she had been a singer. She showed at autopsy a narrow fish-mouth mitral valve with an extreme degree of stenosis. The heart weighed 310 Gm.

SUMMARY

Four patients with mitral stenosis of moderate degree, proved at autopsy, survived the age of 80 years, two men aged 83 and 81 and two women aged 82 and 83. The first patient of the group, Dr. Herman F. Vickery, unaware of his heart trouble, carried on an active and eminently useful medical career, was a leader of his generation and himself wrote on the good prognosis of many cases of rheumatic heart disease.

ALOPECIA AREATA

AN APPRAISAL OF ENDOCRINE FACTORS IN ITS CAUSATION

MORRIS WAISMAN, M.D.

Fellow in Dermatology and Syphilology, Mayo Foundation

AND

EDWIN J. KEPLER, M.D.

ROCHESTER, MINN.

Changes in growth and distribution of hair occur frequently among patients who are afflicted with diseases of the endocrine organs. Probably for this reason it has almost become accepted practice for physicians to assume that the cause of alopecia areata can often be found in the endocrine system. It is further supposed that effective therapeutic results could be achieved if the offending gland were identified and appropriate endocrine treatment instituted. To test the validity of these assumptions this study was undertaken.

We reasoned that if the foregoing premises were correct there would be a high incidence of unmistakable endocrine diseases in a series of cases of alopecia areata. Furthermore, if glandular abnormalities were responsible for the alopecia, the evidence of disturbed endocrine function would be most marked in the severest cases, that is, the cases of so-called malignant or universal alopecia, in which not only most of the scalp hairs and body lanugo are shed but also the secondary, sexually conditioned hairs of the axillae, pubis and beard. If, for example, alopecia areata was the result of insufficiency of the anterior lobe of the pituitary body, one might expect to find instances of chromophobe tumor of the pituitary body in a series of cases of universal alopecia, because such tumors are

often associated with high grade insufficiency of the anterior lobe of the pituitary body. Likewise, if the alopecia was the consequence of insufficiency of the thyroid gland, one would expect a frequent association with myxedema.¹ The same reasoning applies with equal validity to the incrimination of any one of the ductless glands as causative agents of universal alopecia.² For a proper evaluation of endocrine factors in the causation of the disease, we have therefore studied the records of 138 patients who were examined at the Mayo Clinic because of generalized or universal alopecia areata.

SURVEY OF MATERIAL

The sex incidence and age of onset of alopecia in our cases are given in the accompanying table. Of interest is the fact, already noted by other authors, that the sexes are almost equally represented in childhood, but that among adults the disease is more than twice as common in men as in women. Whether the greater frequency in men reflects a constitutional vulnerability of the pilar system, which accounts also for the preponderance of premature, senile and seborrheic alopecias in the male sex, cannot be determined. Attention is called to the incidence of cases beginning in the first three decades of life, comprising 70 per cent of the patients, and particularly to the number of cases in the first decade, during which time the endocrine processes that are concerned with sexual maturity are to some extent dormant and relatively unimportant physiologically.

A familial history of alopecia areata was elicited in 6 cases, but only once was identical universal alopecia reported in another member of the family. Infectious diseases, such as influenza, typhoid, scarlet fever or malaria, preceded the onset of alopecia in 14 cases. A history of antecedent trauma to the skull was provided by 4 patients. Diabetes mellitus complicated the alopecia in only a single instance. Sudden excitement or fright, anxiety and nervous exhaustion were possible predisposing factors in a small proportion of the cases.

The body build of only a few patients was remarkable. Eight were obese and an equal number were underweight. A physique which was characteristic of any one of the endocrinopathies, such as that of the Froelich, Cushing or Simmonds syndrome, or acromegaly, gigantism or infantilism, was not encountered in a single instance.

Menstrual abnormalities occurred in seven women in the form of irregular or scanty flow or both. This is not a significantly large group, and, as far as the menstrual history can be regarded as an adequate practical measure of the endocrine status, there is little evidence of hormonal abnormality in the women studied. In 1 case complete amenorrhea developed at the age of 24 years, nine years after the onset of loss

1. These examples were chosen because the anterior lobe of the pituitary body and the thyroid gland most frequently have been thought to be the offending organs in cases of alopecia areata. In the case of the anterior lobe of the pituitary body, the assumption has been made tacitly that the disturbance of function is one of hyposecretion rather than one of hypersecretion, whereas for the thyroid gland both hyperfunction and hypofunction have been invoked.

2. There are two possible loopholes in this logic: First, one may conjecture that the "pilar function" of a multifunctioning endocrine gland (such as the anterior lobe of the pituitary body) may be impaired, even though the other functions remain relatively intact. Occasionally one does see clinical examples of such dissociated disturbances of function. For example, the first symptom of a chromophobe tumor of the pituitary body may be amenorrhea. In most instances, however, sooner or later as the disease progresses, other functions of the anterior lobe of the pituitary body become deranged; and these derangements eventually become evident clinically. But among patients who are afflicted with alopecia areata there is no such progression of symptoms. Second, one may suppose that alopecia areata arises from the disturbance of an endocrine organ as yet unidentified whose primary function is concerned with the growth of hair. This supposition can be dismissed without further comment.

of hair. Alopecia in 1 case began at the menarche and in 2 cases during the climacterium. It is of interest that, where we have the pertinent information, the menstrual cycle of the girls whose alopecia started in childhood had a normal initiation at puberty, without affecting the growth of hair. In other words, recovery did not take place with the endocrine readjustments of puberty and adolescence.

The variable influence of pregnancy is of extreme interest in certain cases. Each of 6 patients experienced a substantial regrowth of hair during one or more pregnancies (a phenomenon which has been attributed to stimulation by endocrine secretions of the fetus³), only to have the hair fall shortly after parturition. On the other hand, 2 patients observed their first indication of alopecia during pregnancy, and 2 others in the puerperium. It may be added that the very fact that certain women did become pregnant speaks for fairly normal function of the pituitary, ovarian and thyroid glands.

Infertility was a complaint of 2 women, and repeated spontaneous abortions of a third.

Although gonadal abnormalities were observed among several of the male patients, evidence of consequent pathologic decrease of hormonal activity must be regarded as far from conclusive, save for one exception: A youth aged 17 was diagnosed as having bilateral cryptorchism, and no testicular tissue could be demonstrated at operation. Unilateral cryptorchism was present in 3 boys, unilateral testicular atrophy, the result of orchitis complicating mumps, was found in 1 adult, and a mild grade of bilateral testicular atrophy of unknown origin in another. One patient had had orchiectomy performed in the course of herniorrhaphy eighteen years prior to the beginning of alopecia. Five men, none of them in the foregoing group, complained of decreased libido.

The basal metabolic rate was investigated in 62 cases. Rates of less than —10 per cent occurred in 15 cases, the lowest reaching —26 per cent; but there were signs of myxedema in only 2 cases, and treatment with thyroid in neither case caused a restitution of hair despite complete control of the myxedema. The frequency of low metabolic rates in alopecia areata has been observed by others.⁴ This finding should be interpreted in the light of the circumstance that a low metabolic rate occurs not uncommonly even in the absence of myxedema or other clinical evidence of insufficiency of the thyroid gland. Certainly the fact is irrefutable that the vast majority of patients who have subnormal metabolic rates with or without myxedema do not have alopecia areata.

Elevated rates of basal metabolism were recorded for 2 patients, whose readings were +16 and +19 per cent respectively, but in whom no other clinical evidence of hyperthyroidism was demonstrable. One patient had had thyroidectomy for exophthalmic goiter seven years before loss of hair occurred. Three patients presented nodular goiters without signs of hyperthyroidism, and in 2 others a slight diffuse enlargement of the thyroid gland was palpable.

Roentgenograms of the sella turcica in 22 cases disclosed no pathologic features.

Anomalies of pigmentation have frequently been reported in association with alopecia areata, suggesting to some authors, for reasons not entirely clear, supportive evidence for endocrine disease. Vitiligo was present in 9 of our cases and chloasma in 3. The white fuzzy regrowth which commonly occurs in alopecia areata reflects the disappearance of pigment from the region of the hair bulbs, as Woringer and Thé⁵ have shown. Disturbance of nail growth and structure (pitting, longitudinal furrowing, thickening or thinning of the plates) was frequently observed.

Syphilis was diagnosed in 7 cases, but a definite relationship between syphilis and alopecia could not be established, nor did antisiphilitic therapy in these instances influence the hair disease in the slightest. We do not agree with the view emphasized by French authors that syphilis is an important factor in the causation of alopecia areata.

COURSE AND PROGNOSIS

Patchy alopecia, in one or more attacks limited as a rule to the scalp, nearly always precedes generalization of the baldness. In some cases temporary recovery takes place between attacks; in others the patches of alopecia gradually increase in number, progressing over

a period of months or years, to cover the entire body; or, rarely, the loss of hair is rapid, requiring no more than twenty-four hours for complete and total exfoliation. Even the so-called sensory hairs of the nose and ears may be lost, and in at least 1 of our cases a hairy pigmented nevus was observed to have become entirely devoid of hairs.

In many cases an irregular slight growth of lanugo, perhaps interspersed with a few straggling definitive hairs, makes an appearance from time to time, remains for a variable period, and then falls out wholly or in part. Seldom does the regrowth amount to more than a pale silky fuzz over the scalp, although occasionally sparse patches of dark terminal hairs will emerge. Often a seasonal stimulation is noted in the tendency for this abortive growth to occur during the summer months or during a sojourn in a warm climate. In many other cases, however, there is not the slightest sign of the return of hair. The longest duration of the disease in any case of our group is forty-five years. Frequently it lasts during the remainder of a lifetime. Usually the general health is good, both at the onset and after fresh episodes of baldness, and this fact is in itself of no little endocrine significance.

A presumably permanent regrowth of hair occurred in only 4 cases after two to ten years of the disease. That a new growth may not remain, even though present in normal amount, is evidenced by the experi-

5. Woringer, F., and Thé, R.: Contribution à l'étude de la pigmentation des plaques, péladiques, Ann. de dermat. et syph. 6: 1016-1053 (Oct. 23) 1935.

ence of 3 other patients, who reported complete restoration of hair, followed, after an interval of two years or less, by recurrence of alopecia. The small probability of favorable permanent results characterizes alopecia universalis and well merits for the disease the designation "malignant."⁶

Our experience has not convinced us that treatment of any kind has been of avail in this condition. Moreover, many of our patients, prior to coming to the clinic, had been treated elsewhere with "glandular" preparations of various kinds, administered orally or by injection, without appreciable benefit to the hair. There is no doubt that after an intensive course of injections of anterior pituitary or of estrogenic substance a diffuse, fine, downy growth on the scalp is sometimes observed, but we have yet to see the total return of normal terminal hairs as a result of such treatment. Thyroid has been given to persons with and without low basal metabolic rate, without influencing hair recovery. Other methods of treatment have no more to recommend them. We are unfortunately not aware of the factors which, in exceptional cases, contribute to a regrowth of normal hair.

COMMENT

Certain fundamental endocrinologic concepts⁷ may be briefly reviewed for an appreciation of this problem. Function of endocrine secretion is of two types: (1) coordination of organs to the needs of the organism as a whole and to its external environment, and (2) maintenance of physiologic chemical processes within prescribed limitations. Hormones of the second type may be catalytic in character; that is, they hasten processes which would proceed slowly in their absence. It is important to recognize the fact that these reactions do continue in the absence of the hormone but that their velocity is reduced under such circumstances. Growth of hair continues to a certain extent after the extirpation of any one of the organs of internal secretion; it is a primitive characteristic of the species. Unquestionably certain features of hair growth depend on endocrine factors, but whatever influence the endocrine system may have on this growth is probably regulatory rather than absolutely determining. This does not imply that the pilary system may not, per se, become intrinsically deranged and cease to function, even though the stimulating effects of the endocrine system are adequate. The relationship is complex, and we must concur in the opinion of Danforth⁸ that satisfactory information concerning the influence of the endocrine organs on hair growth in man is lacking at present.

SUMMARY AND CONCLUSIONS

A review of 138 cases of universal alopecia fails, in general, to disclose gross clinical evidence of any consistent functional abnormality of the internal secretions. Our data indicate that at present the assumption of an endocrine causation for this condition is unwarranted by the facts. The instances in which concomitant features of definite endocrine disease occur are relatively few, and the associations appear to be incidental rather than causal. These conclusions, we feel, should apply even more forcibly to the common form of alopecia areata, in which the loss of hair is much less extensive. The unfavorable outlook for regrowth of

hair in universal alopecia is emphasized by the fact that only 4 of the patients in this group recovered completely. It is our opinion that endocrine treatment, at least in the present state of its development, is ineffectual.

THE EVALUATION OF PREMARITAL LEGISLATION

W. M. SHEPPE, M.D.

WHEELING, W. VA.

During the past four years a number of state legislatures have imposed restrictions preventing the marriage of persons found to be afflicted with syphilis. This has been accomplished by the amendment of existing laws or the setting up of new statutes. The requirements to be met vary greatly in the twenty-six states which have adopted this type of legislation. In general, the issuance of a license is based on the result of physical examination, laboratory tests or in some instances the mere certification of freedom from venereal disease by a registered physician.

The medical profession has not been unanimous in its sanction of such legislative efforts. The most definite expressions of disapproval have come from eminent syphilologists.¹ A summary of the dissenting opinion indicates the following objections: (a) Too great a reliance is placed on the results of blood examinations. (b) Many patients who have positive reactions of the blood are probably noninfectious. (c) Persons with congenital syphilis would be prevented from marrying, although they are probably noninfectious. (d) Technical or biologic false positive reactions may place the stigma of syphilis on the non-infected. (e) Such legislation is a punitive measure and an abridgment of personal rights. (f) The medical profession was not sufficiently consulted in drafting the laws. (g) The public does not understand the reason for such legislation.

STATISTICAL SUMMARY

Data on the actual number of cases of syphilis detected by means of the premarital dragnet is as yet fragmentary. It was felt desirable to summarize at this time such figures as were available in the literature and to add to these the results observed in West Virginia during the first year of operation of the premarital law. A summary appears in the table.

Several of the reports cited in the table included "estimates" of the number of positive reactions discovered by laboratories not actually reporting. In this discussion such theoretical figures were disregarded. The tabulation therefore included only figures that are susceptible of verification. The period covered by the report extended from Jan. 1, 1936 to June 1, 1940 but varies in the different states depending on the date on which the respective premarital statutes became effective. The criticism may be offered that I am reporting series of positive reactions of blood tests only and not necessarily proved cases of syphilis. The justness of this criticism is acknowledged. It would be most desirable in such a study as this to report the exact number of cases of infectious syphilis among the positive reactors included in my compilation. Such

data are not at present available and from their very nature are not likely to become available in the near future. It is necessary, therefore, to depend on laboratory statistics for an evaluation of the results of premarital legislation.

Tactful questioning indicates that the majority of the group presenting themselves for examination assumed that they were free from syphilis. Persons who know that they are infected do not apply for premarital examination in states having such laws.² It is interesting to note the eventual fate of those refused marriage licenses. New Jersey reported on 206 positive reactors. Of these 113 were judged infectious and refused certificates, 71 gave up marriage, 18 were married out of the state and the action of the remainder is not known. Three months after the examination 135 of the original group were found to be under treatment.

A report³ from Connecticut covered the years 1936 to 1939, inclusive. During this four year period 596 cases of syphilis were discovered among premarital applicants and the applicants were given treatment. Many of these persons were apparently considered noninfectious and were issued certificates after signing an agreement to accept adequate treatment. Cases of congenital syphilis in patients under 1 year of age totaled 38 in 1936, 24 in 1937, 16 in 1938 and only 11 in 1939. It is hardly justifiable to attribute this decrease in the incidence of congenital syphilis to the enforcement of the premarital law in Connecticut, but the progressively declining figures are at least suggestive.

THE WEST VIRGINIA REPORT

As indicated by the figures recorded in the accompanying table the incidence of syphilis in the premarital group in West Virginia (2.4 per cent) would appear to be higher than the incidence shown in any other state report now available. This is of interest, as West Virginia is the first Southern state to present any statistics of this type.

During the first six months of operation of the law in West Virginia (1,600 cases) the incidence of positive reactions was 4.2 per cent. It has steadily declined to the present figure (2.4 per cent). It is probable that as the accumulation of a larger number of examinations provides a broader base for analysis the incidence in this state will approximate the average incidence (1.3 per cent).

The private laboratories in West Virginia continue to perform the major portion of the premarital blood examinations. The state hygienic laboratory carried out 3,807 (3.1 per cent positive) examinations. Thirty-seven of the fifty-two private "approved" laboratories replied to the questionnaire and reported the examination of 6,116 (1.9 per cent positive) blood specimens. This is in contrast to the reports from other states, where most of the laboratory work has been done by city and state laboratories.

The premarital law has been well received by both the public and the physicians of West Virginia. I am aware of no major difficulties which have arisen as the result of its enforcement. The provisions of the statute leave much to the judgment and discretion of the individual physician. I believe that the medical profession has assumed these obligations and is carrying out the letter and spirit of the law in a sincere and conscientious manner.

GENERAL COMMENT

The detection and adequate treatment of every person with syphilis in the general population is acknowledged to be a desirable goal toward which to direct one's efforts. There is no reason to believe that infectious syphilis does not exist in the population of marriageable age. It would seem logical, in view of the far-reaching effects of conjugal and congenital syphilis, that case finding in the premarital group should be even more necessary than in the general population.

The figures presented previously would indicate that 9,017 persons preparing to marry presented at least laboratory evidence of syphilitic infection. These figures are from thirteen states only and cover a relatively short period of time. In the age group under

consideration infection is necessarily of fairly recent origin. This would indicate the likelihood of a high proportion of potential infectiousness in those cases unearthed by the premarital dragnet. It is reasonable to suppose, therefore, that a definite percentage of the positive reactors were capable of transmitting syphilis to their prospective marital partners. It is impossible at present to estimate this proportion. When one considers the total number of syphilitic persons contemplating matrimony, as revealed by this incomplete report, it is impossible to escape the conclusion that the operation of premarital legislation has already prevented a large number of conjugal infections as well as the production of syphilitic offspring. If the accumulation of further data confirms this preliminary impression the objections previously recited must be considered to be of relatively slight importance, valuable principally as suggestions for the improvement of existing statutes.

2. Edwards, Mary S.: Premarital Examination Laws in Operation, *J. Social Hyg.* 26:217 (May) 1940.
3. Talbot, H. P.: Four Years of Premarital Blood Test Law, *Connecticut Health Bull.* 54:211 (Aug.) 1940.

The administration of premarital laws requires the application of common sense by conscientious physicians. The fact that some of the legislation is imperfect does not mean that it is undesirable. It provides a valuable means of detecting syphilis in a group in which such detection is of the utmost importance.

SUMMARY

1. Reports of 677,832 premarital blood examinations have been received from thirteen states; of the persons examined, 9,017, or 1.3 per cent, gave positive reactions.

2. A high proportion of the persons found to have syphilis were unaware of their infection.

3. The incidence of syphilis in the premarital group is fairly uniform throughout the country. It is apparently lower than the incidence of cases in the general population. This difference may be apparent rather than real, as persons who know that they have syphilis probably do not apply for examination.

4. The premarital law in West Virginia has proved acceptable to a large majority of the medical profession and the general public.

5. It is believed that the favorable results accruing from the enforcement of premarital legislation far outweigh the admitted theoretical objections which have been advanced.

GRAFTS OF PRESERVED CARTILAGE IN RESTORATIONS OF FACIAL CONTOUR

CLAIRE L. STRAITH, M.D.

AND

WAYNE B. SLAUGHTER, M.D.

DETROIT

Our purpose in this paper is to consider the materials that may be used as the foundation on which to reconstruct deformed faces. A brief presentation is made of the experiences encountered by us with 100 consecutive cases in which grafts of preserved homocartilage were employed. It is felt that this subject is of importance at this time because the conclusions reached are applicable in war injuries as well as in industrial and domestic accidents.

HISTORY

Medical literature for the past century is dotted with reports of various materials that have been used as the supportive structure on which to rebuild facial contour. Among the materials mentioned may be found such items as ivory, bronze, steel, paraffin, silver, celluloid, fat,¹ cartilage,² dermis,³ fascia, bone and practically anything that may be formed into a shape to fill out the defect in question.

By a process of elimination, based on results obtained, there has been a gradual tendency to discard all inert substances and all tissues except those tissues of mesodermal origin. In Peer's² most recent work, he stated that "unfortunately the human body resents the pres-

ence of foreign material, and when it is used there occurs a slow but progressive action in the surrounding host tissue which eventually results in expulsion of the implant."

The use of inert materials always seems to have a generally unfavorable termination, but the transplantation of tissues from one organism to another seems to have promise, since there is a difference in degree of reaction of different tissues in different environments. It is this difference of "degree" of reaction wherein lies the hope of scientifically using a material not of the host (literally a foreign substance) for the purpose of reconstruction.

Since transplants of the type under discussion are for the replacement of mesodermal structures of a supportive nature (that is, bone and cartilage), then it is logical to assume that bone and cartilage are the materials to be considered for replacement.⁴ Of the two, cartilage possesses the lower metabolic rate—not even requiring blood vessels to carry on its metabolism.⁵ It is this low metabolic rate and similarity of chemical structure to other mesenchymal tissues that make bone and cartilage the only substances that can be rightfully considered in the peculiarities of reconstructive surgery. With the mechanical advantages favoring cartilage, together with the physiologic advantages of a lower metabolic rate and a less highly developed differentiation of the tissue itself, it may be assumed that the question resolves itself into one of how cartilage may be used to the best advantage.

INDIVIDUALITY DIFFERENTIAL

When tissues are transplanted from one organism to another, or merely transferred from one position to another in a given host, there is a difference in degree of reaction. To discuss this phenomenon in the light of existing literature, a brief review of the terminology is necessary.

By transplantation is meant that there is complete or partial separation of a piece of tissue or organ from its normal connection and its transfer to a different place, either in the same individual (autograft), into another not directly related individual of the same species (homograft) or into an individual belonging to a different species or class of animal (heterograft).⁶

All tissues possessed by a given individual have certain chemical characteristics in common. Such things as immune bodies, hormones, vitamins, agglutinins and waste products, together with the inorganic chemical components, may enter this classification, but they do not constitute its major component. As far as the specific chemical characteristics are concerned, there may be an interchange of position of tissues within the individual without any undue reaction from these specific entities.

The chemical characteristics that are held in common by all tissues of a given individual are termed collectively the individuality differential. This common characteristic distinguishes one individual from all others, no matter how closely related otherwise, in a manner analogous to finger prints that set each man aside from his fellows.⁷

7. Leob, Leo: The Grafting of Tissues into Nearly Related Individuals in the Rat and Mode of Inheritance of Individuality Differential, *J. M. Research* 33: 393, 1918; *The Biological Basis of Individuality*.

The further removed the relationship of individuals the fewer chemical characteristics the individuals have in common, and in attempting transplantation of tissues between individuals the presence of these unlike chemical characteristics in donor and host is the basis for reaction. Axiomatically, then, the more distant the relationship, the more violent must be the reaction when the dissimilar tissues are brought together.

Since all possible gradations of relationships between donor and host are found, then, correspondingly, all possible intensities and kinds of reactions may be expected when tissues are transferred.

To carry the point one step further, it may be said that the less developed the organism, the more likelihood of success with transplants of tissue. Without our going into the details as to methods, the works of Born,⁸ Rand and Browne⁹ and Ullman,⁴ together with others, may be of assistance in understanding the problem in hand by our quoting their collective conclusions: "That, in general, transplantability increases with the ontogenetic and phylogenetic primitiveness of the organisms which serve as hosts and donors."

ORGAN AND TISSUE DIFFERENTIAL

When tissues are transplanted from one individual to another, a certain reaction is anticipated, owing to the chemical differences of the individuals themselves (i. e., individuality differential). If, for example, however,

Fig. 1.—An early childhood injury, resulting in a septal abscess, caused this boy's saddle nose. The deformity was such that the normal air passages were restricted; the restriction may have been an etiologic factor in the underdevelopment of the chin. The resulting deformity was a decided handicap.

tissue from the thyroid is transferred from one individual to another and cartilage also transferred under the same conditions, the end results will not be the same.

8. Born, G.: Ueber Verwachungsversuche mit Amphibienlarven, Arch. f. Entwicklunsgnischm. d. Organ. 4: 350, 1896-1897.
9. Rand, H. W., and Browne, E.: Inhibition of Regeneration in Planarian by Grafting, Proc. Nat. Acad. Sc. 12: 575, 1926.

The chemical characteristics of the individual will be the same toward one another, but the added reaction of the difference in chemical composition of the organs or tissues themselves will be added. In other words, the organ or tissue differential now enters the picture.

Fig. 2.—At one operation, the saddle nose and receding chin were reconstructed with preserved cartilage. Three large pieces were necessary to build out the chin, together with a dorsal and columellar strut to the nose. It would have been difficult to obtain the massive amount of cartilage necessary for this operation from the patient himself. It is felt that his chances in life have been greatly improved by the more pleasing facial configuration.

Success in transplantation of whole appendages, organs and massive pieces of tissue, as for example in experimental embryology on frogs, is not an indication of what will happen when like experiments are attempted in human beings or higher vertebrates. The lack of understanding in applying the knowledge gained from laboratory experiments to possible similar undertakings in human beings, such as the transplantation of ears from mother to son or the transference of fingers from one human being to another or other plastic procedures, is bound to lead to total failure¹⁰ because it involves both individuality differential and organ and tissue differential. This one fact has led to many a sad and disheartening experience encountered by the plastic surgeon wherein a patient has demanded for himself results that might be obtained only in experimental animals. This disillusionment of the patient is made more tragic by the false hope instilled in him by the misguided enthusiasm of those erroneously interpreting the literature.

TOXINS DUE TO GRAFTS

Since the products of metabolism in transplanted tissue are toxic to the host, they are spoken of as autotoxins, homotoxins or heterotoxins, the appellation

10. Loeb, Leo: The Biological Basis of Individuality, Science 86: 1, 1937. Famulener, L. W.: On the Transmission of Immunity from Mother to Offspring, J. Infect. Dis. 10: 332, 1912.

depending on the type of graft under consideration. Just which constituent or constituents make up the toxic products in this reaction is not clear, nor is their duration of activity definite.¹¹

With the foregoing information as a basis, an explanation for the various tissue reactions may be

Fig. 3.—This girl, aged 15, refused to go to school because of the shape of her nose. The deformity resulted from a fall two years previously in which her nose was fractured and the septal support lost.

stated as follows: Different tissues, including cartilage, react differently when transplanted from one organism to another or when merely transplanted in different locations in the original host, both in experimental animals and in human beings, for the following reasons: first, the difference in the chemical characteristics that go to make up the individual—the individuality differential; second, the difference in the chemical characteristics that go to make up the individual tissue or organ—the organ or tissue differential, and third, the difference in metabolic rate of different tissues and the variable rate at which they produce metabolic waste products.

The next question that arises is relative to the advantage that cartilage has over other tissues in relation to the degree of tissue reaction.

It has been found, in animal experimentation,¹² that autotransplantation of unpreserved cartilage is carried out with success to the extent that the cartilage may be said to have returned to a normal state; this statement cannot be made for such tissues as fat, thyroid and muscle. In homotransplants of unpreserved cartilage, there forms as a rule a thick layer of fibrous tissue, but the cartilage itself remains largely intact although isolated parts of it may become necrotic because of trauma. Certain parts of the cartilage are

less resistant, especially the large cells that immediately adjoin bone; these usually perish after homotransplantation, while they may be preserved after autotransplantation. In the heterotransplants of unpreserved cartilage, the necrosis is more extensive, resulting in the complete disappearance of the graft in a few weeks.

After the homotransplantation of cartilage, the rise in the polymorphonuclear leukocyte count is lacking entirely, or almost so. The amount of homotoxins given off is apparently insufficient to reach the threshold necessary to cause a rise, whereas other tissues do cause a considerable increase in these cells.

Homoreactions seem to appear only around living and therefore metabolizing transplanted tissue, whereas the heteroreactions appear even around dead or non-metabolizing tissue. Siebert¹³ found that homotransplants, killed before transplantation by mild degrees of heat, no longer elicit a homoreaction, while heterotransplanted tissue, under the same condition, still calls forth a definite heteroreaction on the part of the tissue of the host.

Of cartilage specifically it may be stated that it gives off less homotoxic substances than practically any other tissue, but it too may be destroyed eventually by the invasion of the host's connective tissue—a sign that even cartilage has some form of action injurious to the host. It is this relative failure to produce homotoxic substances that makes cartilage more

Fig. 4.—Preserved cartilage was used to obtain a satisfactory result. In this case, a secondary operation was done to shorten the columellar cartilage through an incision in the mucobuccal fold. At no time was there any evidence of a reaction.

desirable than other tissues for transplanting. This is probably dependent, in part, on the low metabolic rate of cartilage and consequently a failure to produce

homotoxins plus similarity of tissue differential which may be expressed as lack of differentiation of the tissue itself.

HISTOLOGY

How may cartilage best be used? This may be answered in part by the works on the histology of

Autografts are frequently accepted by the host in such a favorable manner that the graft continues to live as viable cartilage, but this type of graft is subject to capricious actions on the part of the host, and it may elicit a reaction of such severity that it too will eventually be lost. As has been repeatedly pointed out by others employing cartilage, it does have disadvantages when used as an autograft. Obtaining the cartilage itself may require an operation much more conducive to complications than is warranted by the reconstruction contemplated.

Autografts in our hands have shown a tendency to curl both in the horizontal and in the perpendicular dimension. This is particularly true if the cartilage is from a portion of the rib normally containing a greater portion of fibrous tissue.

Grafts of unpreserved homocartilage may survive transplantation as live grafts, being surrounded by a

Fig. 5.—One of the greatest advantages of preserved cartilage is in the application to surgical intervention on children. Many children suffer injuries that are disfiguring. These should be corrected at an early age to counteract the development of an inferiority complex due to ridicule from thoughtless playments and relatives. Their own ribs are not well formed as yet and they readily curl and absorb if used. As a result, most of these children have been compelled to await maturity for the necessary correction. This boy is a typical example.

human beings. Peer, who has done the most complete work in this field, has found that "pickled" cartilage (preserved in 50 per cent alcohol) remains, after transplantation, as tolerated dead foreign bodies (homografts), for about nine and one-half months.¹⁴ From this time on, the surrounding tissues of the host invade the foreign cartilage and slowly absorb portions of it. This process, however, is gradual, and the bulk of the graft is still present two years after transplantation. The specimens examined by Peer at fourteen months and at two years after transplantation showed areas of calcification or early formation of bone.

In contradistinction, autogenous cartilage from the ribs survives after transplantation as living cartilage up to periods as long as six years, neither increasing nor decreasing in size. Peer further stated that he could not advocate or discourage the clinical use of grafts of preserved cartilage on the basis of his experiments. If absorption of the cartilage and replacement by fibrous tissue and bone maintains the contour of the grafts, then this may constitute a desirable filling substance even though the original cartilage itself is lost.

Fig. 6.—This boy, aged 13, was sensitive about his saddle nose. The deformity was corrected by the use of preserved cartilage. It is felt that all such deformities in children should be corrected to allow a more normal development of their personalities.

14. Peer, L. A.: Cartilage Transplanted Beneath the Skin of the Chest in Man, Arch. Otolaryng. 27: 42 (Jan.) 1938; The Fate of Living and Dead Cartilage Transplanted in Humans, Surg., Gynec. & Obst. 68: 603, 1939.

fibrous capsule developed on the part of the host, and a delicate balance may thus be set up whereby the graft may live, relying for nourishment on the diffusion of food products from the host. Once unfavorable factors

are introduced to upset this balance, the previously living cartilage dies and is absorbed and replaced by connective tissue.

Homografts, whether used as fresh or as preserved material, have about equal advantages as far as the question of immediate result at the site of implantation

more massive reconstructions presents a major problem to the donor. This can be true in autografts as well as in homografts. Some of the reconstructions require five or six large pieces of cartilage, and this might leave the donor embarrassed.

From the foregoing information the following statements may be formed: 1. Heterografts need not be considered in any form. 2. Autografts present many problems that make them unpractical if the results can be otherwise favorably compared to the remaining type

TABLE 2.—Complications in Nineteen Cases

of graft—namely, the homograft. 3. The unpreserved homograft is also not practical, as has been pointed out. This leaves the consideration of the preserved homograft.

TECHNIC

The percentage of success that may be anticipated with the use of homografts is determined from information gained by us in the review of 100 consecutive cases. In this group of cases, the period of observation extends from one and one-half to four years. The more recent cases are not included because it has been found that

Fig. 7.—Straith's profilometer can be used to measure the amount of depression in a saddle nose and indicate the shape and size of the transplant needed. It is also of great value as an aid in reducing hump noses to the proper profile angle. It makes the reconstruction of nasal deformities more uniform.

in the new host is concerned. Live homografts are transplanted with the knowledge that they will probably become at least partially necrotic and eventually be invaded by connective tissue, even though it may be more or less viable. They may live as parasites by the products of diffusion inside a fibrous capsule developed by the host, remaining only until this equilibrium is disturbed. The preserved cartilage can be placed without the necessity of an operation to obtain the cartilage, and it is known that the cartilage will not be viable but will act as a tolerated foreign body, and, because there is no active metabolism, it will not initiate such active tissue response on the part of the host.

PRACTICABILITY OF PRESERVED HEMOCARTILAGE

Preserved homocartilage seems to be the type of choice of the homografts. Large quantities may be obtained at autopsy, sterilized and stored to be used as needed. This eliminates a major operation on the new host. Furthermore, from actual experiences, it seems that cartilage of this type resists infection better than any other material.

The use of homografts without means of preservation—that is, the use of fresh homografts—has so many unpractical aspects that it hardly needs to be mentioned. To obtain a donor who will supply cartilage at the proper time is in itself a major problem. For a person to lose the amount of cartilage necessary in some of the

Fig. 8.—After insertion of the properly contoured cartilage, the nose now is seen to assume a more normal angle.

changes such as migration, curling and gross absorption can occur at a late date, and it was felt that such cases would not present a true picture of the results that might be anticipated.

All other types of cartilage, such as auricular and septal, have been discarded in favor of costal cartilage.

It is obtained during autopsy in cases in which the cause of death is known and in which the deceased person's blood is serologically normal. Middle-aged persons are preferred, as their cartilage does not present too much fibrous tissue or too much calcification. The cartilage is removed with as aseptic a technic as possible and placed in "merthiosaline" (a solution of 1 part aqueous merthiolate [1:1,000] to 4 parts of sterile physiologic solution of sodium chloride) according to the technic of Pierce and O'Connor.¹⁵

Variations from the technic just given seem to lead to poorer results. The cartilage must be preserved in such a manner that its chemical composition at the time of transplantation approximates the physiologic chemical composition of the new host. Failure to do this results in unmistakable reactions of a severe nature. Too great a concentration of mercurial salts in the cartilage may result in a purely chemical irritation in the new host. An effort to maintain as nearly as possible a physiologic solution and yet maintain sterility is the method of choice.

Biweekly cultures and frequent changes of the "merthiosaline," especially early in the preserving process, are of the utmost importance.

RESULTS IN ONE HUNDRED CASES

The cases about to be reviewed concern the use of grafts of homocartilage in and about the face. As stated before, the period of postoperative observation varies from one and one-half to four years. There will be some duplication in the figures as, in some cases, more than one type of operation was carried out on a single person.

The total number of consecutive cases reviewed is 100. Of this group, there were 81 in which there was an uneventful postoperative recovery and in which no subsequent operations or treatments were required after a period of ten days. In the remaining 19 cases, everything from local redness without a rise in temperature to frank infections with systemic reactions is included as complications. The types of operations are classified in table 1.

The complications in 19 cases in which there was some type of complication are subdivided in table 2.

From the evidence presented it is seen that 81 per cent of the patients suffered no complications. Of the remaining 19 per cent who did present complications, all retained their cartilages and eventually made a satisfactory recovery with the exception of 4 patients in whom the cartilage was lost entirely and 2 in whom the cartilage was lost in part. The 2 patients who had a partial loss of the cartilage were not reoperated on because they were satisfied with the cosmetic result. Thus 94 per cent of the grafts were classed as successful.

Seven of the patients were reoperated on to remove or trim cartilage when curving or migration had taken place. Three were reoperated on to add more cartilage to the original amount, purely for cosmetic reasons.

Of the 4 patients who lost their cartilage entirely, 2 were operated on again, preserved cartilage homografts being used, with complete success. One of the patients had had a previous operation elsewhere in which an autograft cartilage had been used and lost. This was replaced with a preserved homograft with satisfactory results.

Several patients in whom complications developed had thick, red skin containing enlarged pores filled with

secretions. These persons generally carry an unfavorable prognosis probably because, in elevating the skin, the most dependent portion of the glands (sweat and sebaceous) is cut off, allowing gross contamination of the undermined tissues.

In several cases hematomas developed after the patients had removed the splints which had been placed on the nose to maintain pressure. Premature removal of splints, together with periods of "sneezing," seemed to be the most important etiologic factor in the production of hematomas. These complications were seen most frequently in male patients.

CONCLUSIONS

In view of the biologic rationale as brought out in the opening sections of this text and the encouraging results obtained in actual practice of the technic as reviewed, it seems quite logical to accept the use of homocartilage preserved in "merthiosaline" as the basis on which to restore facial contour. Homocartilage has the great advantage of eliminating the somewhat hazardous operation of costal resection with its prolonged incapacity and morbidity.

As shown by a review of 100 consecutive cases in which homocartilage grafts were employed, 81 per cent were without complications while 94 per cent of the operations resulted in eventual success by the use of the described technic. Better results can hardly be expected with autogenous grafts, and certainly the use of no other foreign substance can compare with it.

Clinical Notes, Suggestions and New Instruments

PULMONARY LESIONS IN HODGKIN'S DISEASE

ROBERT CHARR, M.D., PHILADELPHIA, AND
ALFRED WASCOLONIS, M.D., WHITE HAVEN, PA.

The case of Hodgkin's disease which we present was interesting in that hemoptysis was one of the symptoms and in that the disease was almost entirely limited to the right lung.

REPORT OF CASE

History.—A white woman aged 23 was admitted to the White Haven Sanatorium in March 1940. She complained of pain in the right side of the chest, dyspnea, cough, expectoration and hemoptysis. The illness began in July 1939 with pain in the right side of the chest. Soon dyspnea began. Cough and expectoration with occasional hemoptysis followed.

Physical Examination.—Nutrition and color were poor. The cervical lymph nodes were palpable on both sides. The chest showed signs of effusion on the right side with displacement of the heart toward the left. The abdomen showed no masses or ascites. The blood pressure was 108 systolic and 70 diastolic. The temperature was 99 to 102 F., the pulse rate 100 to 130 and the respiratory rate 20 to 30. The weight was 81 pounds (36.7 Kg.).

Laboratory Observations.—The urine showed albumin and the blood secondary anemia with leukocytosis (22,800 cells, 90 per cent of which were polymorphonuclear leukocytes). Examination of the sputum was repeatedly negative for tubercle bacilli. The pleural fluid was yellowish and slightly turbid, and the smear and culture of it were negative for tubercle bacilli. The sedimentation rate was increased 31 mm. at the end of an hour. A cervical lymph node taken for biopsy showed a typical appearance of Hodgkin's disease, such as marked

increase of connective tissue, destruction of the normal architecture of the node and occasional eosinophils, but Reed cells were not found.

Röntgen Diagnosis.—The right side of the chest presented an evenly dense shadow. The left side was clear. The heart was displaced toward the left (fig. 1). Pleural effusion of unknown etiology was diagnosed.

Fig. 1.—The dense shadow in the lower two thirds of the right side of the chest suggested an effusion. The left lung appeared essentially normal. The heart was displaced toward the left side. (Courtesy of Drs. John T. Farrell Jr. and E. Robert Wiese.)

The right pleural cavity contained 0.5 liter of turbid yellowish fluid. On section the masses in the lung and hilar regions were yellowish and firm, having considerable infiltration of fibrous tissue. The central portions of the nodules were necrotic, forming cavities. In the posterior portion of the lower lobe were small nodules. The bronchial mucosa appeared thickened. The left lung was normal.

The pericardial sac contained about a liter of turbid yellowish fluid. The heart was small and the myocardium flabby. The valves were normal. The gastrointestinal tract appeared normal. The spleen was of normal size. No nodules were found. The liver was larger than the average, but no nodules were seen. The kidneys were normal. The mesenteric lymph nodes were not unusual.

Fig. 2.—The middle lobe and the anterior half of the lower lobe of the right lung were extensively involved. The upper lobe of the right lung showed scattered nodules. The hilus lymph nodes, particularly on the right side, were greatly enlarged. The left lung was normal.
